kingdom, David naturally sent his people for shelter thithe
when he had broken with Saul; the incident is precisel
analogous to what happened when he himself at a late
period took refuge from Saul's persecution in Philistin
territory, and need no explanation from the book of Ruth
As soon as he ceased to be the king's enemy by himse
becoming king, his relations with Moab became precisel
those of his predecessor. The war in which apparentl
accidental circumstances involved him with Hanun ben Nahas
of Ammon really arose out of larger causes, and thus sprea
to Moab and Edom as well. The end of it was that a
the three Hebrew nationalities were incorporated with th
kingdom of Israel: the youngest brother eclipsed and sub
dued his senior, as Balaam had foreseen. Through th
work of Saul and David the political system of Palestin
was altogether changed: the smaller peoples were no longe
a match for Israel, which established a decisive preponde
ance, and transformed what had hitherto been jealousy o
the part of Moab and Ammon as well as of Edom in
bitter hatred; the hatred did not cease even after nothin
but a religious shadow remained of what had once been th
political supremacy of the people of Jehovah.

The struggle with Ammon which David began ultimate
assumed larger dimensions, and brought the Aramaea
also into the field against him. He was successful, indee
against them also, and destroyed their most powerf
kingdom; but after his death they recovered themselve
and pressed steadily on from the borders of the wilderne
towards the sea, at their head were those kings of Damasc
who had established themselves on the ruins of Zoba.
presence of these enemies the already fading distinctio
between the ruling and the subject nationality within t
kingdom of Israel now completely disappeared; and ev
towards the Canaanites outside the relations of the kin
became friendly. It is in one instance expressly stat
that the common danger threatening from the East h
to do with this (2 Sam. viii. 9 *sqq.*). But, conversely,
was natural that Ammon and Moab should make comm
cause with the Aramaeans, such an attitude was suggest
by geographical position and old connexions, but abo
all by their helpless fury against Israel. Both nationalit
must have succeeded in emancipating themselves very so
after David's death, and only now and then was some stro
king of Israel able again to impose the yoke for a time,
upon the Ammonites indeed, but upon Moab. The first to
so was Omri, who garrisoned a number of their towns a
compelled the king to acknowledge Israel's suzerainty
a yearly tribute of sheep, a state of matters which co
tinued until the death of Ahab ben Omri. But when th
brave king fell in battle with the Aramaeans at Ramo
Gilead (about 850 B.C.), Mesha of Dibon, then the ru
of Moab, seized the favourable opportunity to make hi
self and his people independent. In his famous inscripti
he tells how, through the wrath of Chemosh, the land h
fallen into the enemy's power and endured forty years
slavery, and how by the grace of Chemosh the yoke is n
broken and the Israelites ignominiously driven off.

[illegible] seems to have been any difference in this respect

MU'ALLAKAT *Al Mu'allakat* is the title of a group
of long Arabic poems, which have come down to
the time before Islam. The name means "the
hung up," the traditional explanation being that
poems were hung up by the Arabs on one of the
at Mecca. The oldest passage known to
which is stated occurs in the *Akd* of the Spanish Arab,
al Rabbihi (A.D. 861-940). Beside the
[illegible] read these: "The Arabs had such an interest in
and valued it so highly, that they took seven long
selected from the ancient poetry, wrote them in gold
Syrian cloth, and hung them up (*'allakat*)
curtains which covered the Ka
golden poem of Amraalkais, 'the golden poem of
The number of the golden poems is seven; they
called 'the suspended' (*al Mu'allakat*). Similar
not to be met with in later Arabic writers. But against
have the testimony of a contemporary of Ibn 'Abd
, the grammarian Nahhas (*circa* A.D. 940), who says
ommentary on the Moallakat: "As to the assertion
ey were hung up on [or in] the Kaba, it is not known
of those who have handed down ancient poems
nations elsewhere is more trustworthy in reporting
so utterly unauthenticated. The customs of the
before Mohammed are pretty accurately known to
have always a mass of information about the affair
or anything like it is found in really good and
authorities. We hear, indeed, of a Meccan hanging
oul of battle on the Ka'ba (Ibn Hisham, ed. Wü
, p. 433). Less credible is the story of an important
of being deposited in that sanctuary, for the lodging
in case of later usages being transferred to pre
times. But at all events this is quite a different
from the hanging up of poetical manuscripts. To
the first appearance of the Mo'allakat from the
we are told in a passage of late origin (De Sacy,
, 2nd ed. p. 20) that they were taken down at the cap
Mecca by the Prophet. But in that case we should
some hint of the occurrence in the enemy-tantal
ohic of the Prophet and in the work on the history
ca, and we find no such thing. That long poems
written at all at that remote period is improbable in
treme. All that we know of the diffusion of Arabic
even up to a time when the art of writing had
far more general than it was before the spread of
point exclusively to *oral* tradition. Moreover, it
e inconceivable that there should have been either a
or a private individual of such acknowledged taste,
or of such influence, as to bring about a consen
opinion in favour of certain poems. Think of the
offence which the canonization of one poet must have
to his rivals and their tribes! It was quite another
for an individual to give his own private estimate
respective merits of two poets who had appealed to
umpire, or for a number of poets to appear at large
ings, such as the fair of 'Okaz, as candidates for the
of honour in the estimation of the throng which li
to their recitation. In short, this legend, so often r
by later Arabs, and still more frequently by Eur
must be entirely rejected. The story is a pure fabr
ted on the name "suspended." The word was ta
t literal sense, and as these poems were undou
prized above all others in after times, the same
was attributed to "the [ancient] Arabs," who wer
posed to have given effect to their verdict in th
already described. A somewhat simpler version
given by Nahhas in the passage already cited, is as fo
"Most of the Arabs were accustomed to meet at 'Ok
recite verses, then it the King was pleased with any
he said. Hang it me, and preserve it among my trea
But, not to mention other difficulties, there was no
all the Arabs, and it is hardly probable that any A
king attended the fair at 'Okaz. The story that the
were written in gold has evidently originated in the
"the golden poems" (literally "the gilded"), a figurat
pression for excellence. We must interpret the desig
"suspended" on the same principle. In all probab
mean (poems) which have been raised, on acco
their value, to a specially honourable position. A
derivative of the same root is *'Ilk*, "precious thing."

The selection of these seven poems can scarcely
been the work of the ancient Arabs at all. It is
more likely that we owe it to one connoisseur of
date. Now Nahhas says expressly in the same pa
"The true view of the matter is this: when Ha
mmad (Hammad the Rhapsodist) saw how litt
cted for poetry, he collected these seven pieces,
people to study them, and said to them: 'These a
[poem] of renown.'" And this agrees with all ou
information. Hammad (who lived in the first thre
ters of the 8th century A.D.) was perhaps of all m
one who knew most Arabic poetry by heart. The
tion of poems was his profession. To such a rha
the task of selection is in every way appropriate;
may be assumed that he is responsible also for the
what fantastic title of "the suspended."

The collection of Hammad appears to have consi
the same seven poems which are found in our
editions, composed respectively by Amraalkais,
Zohair, Labid, 'Antara, 'Amr ibn Kolthûm, and
ibn Hilliza. These are enumerated both by Ibn
Rabbih, and, on the authority of the older philolog
Nahhas; and all subsequent commentators seem to
them. We have, however, evidence of the existe
a very early period, of a slightly different arrang

correctly, they also called this modified collection
kat. Mofaddal employs, besides, the names "the
ng [poems]" and "the necklaces." This last be
afterwards a common title for the seven poems.
mparison of songs to strings of pearls is a very apt
m the nature of the Arabic poem, composed as it
eparate loosely-connected parts. Hence it became
ular that even in ordinary prose to speak in rhyth
form is called simply *nazm*, "to string pearls"
dal expressly opposes the view of those who did not
ledge the pre-eminence of the seven poets selected
. This appears to be an attack on Hammad for
ng in his collection the works of two men who for
fame could certainly never enter the lists with
a and Aʿshá. It is *prima facie* more likely that a
riter should have replaced the less famous poets by
who were universally placed in the first rank, than
esa. Perhaps another fact is of some importance
Hammád, a Persian by descent, was a client of the
ribe, Bakr ibn Wail. In the heathen period this
was much at war with the closely related tribe
. Now of all Arabic poems none was more famous
hat in which ʿAmr ibn Kolthum celebrates in
g terms the praises of his tribe Taghlib. It,
re, Hammád's collection embraced this poem, it was
at'eral for him to gratify his patrons the Bakrites
ing alongside of it that of Harith a Bakrite and
porary of ʿAmr where he extols his own tribe and
the Taghlibites with bitter scorn. Such considera
d not affect Abu ʿObaida and Mofaddal
authority of these men has so far prevailed that
ems of their favourites Nabigha and Aʿshá often
in the manuscripts, not indeed instead of those of
and Harith, but after the other seven. Thus we
mes read of *nine* Moʿallakat. The first author in
the writer has observed this is the great philosopher
n Ibn Khaldun (A.D. 1332–1406); he mentions
l of Hárith the far more celebrated ʿAlkama,
er relying on ancient authority, or by an oversight,
not tell. In an excellent collection of forty nine
poems by Abú Zaid al Kora his editor unknown)
dal's seven poets appear in the first class, "the
es;" but Nabigha and Aʿsha are each represented
ifferent piece from that usually reckoned among the
akát. By this editor the name "golden poems,"
as we have seen, sometimes occurs as a synonym of
llakat," is applied to seven quite distinct ones.[1]
uncertainty as to the selection and the titles may
as an additional proof that the "suspension," on the
or anywhere else, is a fable.

lives of these seven (or nine) poets were spread
period of more than a hundred years. The earliest
m, according to the common and probably correct
n, was AMRALKAIS (pronounced also Imroolkais,
ikais, &c.), regarded by many as the most illustrious
bian poets. His exact date cannot be determined
robably the best part of his career fell within the
alf of the 6th century. He was a scion of the royal
of the tribe Kinda, which lost all its power at the
of King Hárith ibn ʿAmr in the year 529.[2] The
royal father, Hojr, by some accounts a son of this
, was killed by Bedouins. The son led an adven
life as a refugee, now with one tribe, now with
r, and appears to have died young. The anecdote
l of him—which, however, are very untrustworthy
ail as well as his poems, imply that the glorious
memory of his house and the hatred it inspired were
comparatively fresh, and therefore recent.

The Moʿallaḳa of ʿAMR hurls defiance against the
of Hira, ʿAmr son of Mundhir, who reigned from
summer of 551 till 568 or 569, and was afterwards
by our poet.[3] This prince is also addressed by Harith
his Moʿallaka. Of TARAFA, who is said to have at
no great age, a few satirical verses have been pre
directed against this same king. This agrees with
fact that a grandson of the Kais ibn Khalid, mentioned
a rich and influential man in Tarafa's Moʿallaka (v.
81), feigned at the time of the battle of Dhu Kar in
the tribe Bakr routed a Persian army. The battle

The authors of old Arabian poetry do not exhibit differences in their general manner and to bring to the mind a clear idea of their indivi- Very distinct poetic types emerge, but the great poets present a somewhat monotonous to the western scholar, who indeed can at best have ery imperfect feeling for *nuances* of style in this field. we are thus unable to isolate the various constituent this poetical literature, and pass a critical opinion , we do get from the literature, as a whole, what r greater part than an æsthetic estimate of that particular poet, viz. a poetic picture of the life and activity of that remarkable people which, the endless agitation and endless sameness of its e, and in an extremely inhospitable region, was ng one of the mightiest revolutions in the history world. This collective impression is hardly impaired involuntary alterations made by the rāwīs; nor is it greatly distorted by the forgers of the 2d century of Islam, who were thoroughly familiar with the spirit and style of antiquity, and seldom did violence to them.

The critics of the 2d and 3d centuries A.H. unanimously ranked the poets of the heathen period above those of Islam; and in that verdict we must concur. The older Moslem poets were for the most part mere Epigoni, content, for better or worse, to borrow the style of their pagan predecessors. It is only natural, therefore, that the seven best poems should have been selected from the productions of heathenism. But how these particular seven came to be fixed upon, it is difficult to decide. It is remarkable that people who knew thousands of such poems should have agreed as to the superiority of five, and only differed about two. No doubt the selection was greatly influenced by the widely-established reputation of certain poets, like Imruulkais, Zohair, and Ṭarafa; while in other cases single poems, such as that of 'Amr, stood in high repute for special reasons. Still, even we, with a much narrower range of selection, should hardly pick out these seven as the finest. In all probability our choice would not light on a single one of them. The truth is, our æsthetic ideal is essentially different from that of those old *littérateurs*. And, while we may certainly consider our own taste, formed on the model of the Greeks and the best of the moderns, to be on the whole purer than theirs, we must not forget that they had the advantage of perfect knowledge of the language and the subject-matter, and could thus perceive a multitude of beautiful and delicate touches, which we either miss entirely or realize with laborious effort. The world of the old Arabian poet lay at an infinite remove from ours. His mental horizon was narrow but within that horizon every minute detail was seized and designated with precision. Among the nomads, for example, the smallest point of the horse or camel that the eye can see has its importance; the language has precise and generally understood words for them all, where ours has only technical terms. It is the same with all the physical properties of the animal—its paces, etc. Thus when a poet faithfully described the exterior and the deportment of his camel, that was to his hearers and the same is true of later critics a genuine pleasure, because the description conveyed to them a definite pictorial impression. But we do not understand the details of the picture, or, when at best with all the resources of tradition and natural history we have gained some tolerable comprehension of them, the whole still leaves us indifferent. A camel to us is simply not a poetical object; and even a horse ceases to be æsthetically interesting—except perhaps to a sportsman—when one is asked to go over his points in detail. For this reason we are apt to find a great part of Ṭarafa's Mo'allaka, and many parts of the poems of Imruulkais, viewed as poetry, distasteful rather than interesting. More attractive are the descriptions of the life and habits of wild animals in the desert, such as the wild ass and some species of antelope, which the poets are fond of introducing (see, *e.g.*, the Mo'allaka of Labíd). There are also many vivid sketches from nature to be met with, nature, of course, as seen in the very monotonous Arabian landscape. Monotony, indeed, is a predominant characteristic of this poetry. When one first reads poems where the bard begins by shedding tears over the scarcely perceptible traces of the dwelling of his beloved in years one by, one's sympathy is aroused. But when poem after poem is found to commence with the same scene, and possibly with almost the same words, the emotion is somewhat damped. No doubt such occurrences must really have been very common in the nomad life; nevertheless the suspicion becomes at last irresistible that for the most part all this is pure fiction. Nor can we be sure that the

re always to be taken *au sérieux* when they describe arousals, and other adventures in peace and war, of hey love to boast. They are probably more serious narratives of their love experiences: these are often ghly coloured, and yet are always pervaded by a natural refinement, which is too often wanting in the otic poetry of the Moslems. But there, too, our enjoy s frequently marred by minute and even prosy de ns of the physical charms of the object of affection. lyrical and even the more rhetorical passages of the make in general a deeper impression upon us than riptive portions, to which they owe their dramatic er, and which are often intimately blended with the

When those old Arabs are really moved by love, , or grief, when personal or tribal vanity vents itself oderate boasting, invective, or banter then they chords that thrill our breast. In those passages genuine human feeling is stirred, they also display ater individuality than in the more conventional tions. Especially affecting are the numerous pas complete poems which mourn over the beloved nerated dead. Their sober practical philosophy too, presented in the Mo'allaka of Zohair and in many d's poems, is really impressive

Mo'allakát are highly characteristic specimens of this They exhibit nearly all its merits as well as most defects. Amongst its merits we ought, perhaps, to the unfailing regularity of the verse. That a people nder such extremely simple conditions should have ted a purely quantitative metre, so euphonious and rously adhered to, is a fact worthy of our highest tion. It is one evidence of that sense of measure ed form which is, in other direction also, a marked in the life and speech of the Arabs. The mere fact their verses they give so much attention to elegance ession deserves commendation. Among the defects poetry we must emphasize the loose connexion n the separate parts. We require a poem, like any work of art, to be a compact unity; the Arabs and other Orientals lay all the stress on the detail. In o'allaka of Tarafa, for instance, after the poet has long enough about his beloved, he starts off in this : "But I banish care when it comes near with a" uel of such and such qualities, and then proceeds e a description of his riding camel. Equally abrupt ions occur in almost all these poems, generally more nce in the same poem. In many cases a sort of unity erved by making the different sections represent so scenes from the life of the poet or from the common the Bedouins; but even then there is sometimes factory in the want of real connexion. It does not matters much when the poet keeps up a merely nical transition; as, for example, when he speaks his camel, then with the words "it is as swift as a ss which," &c., passes to a description of that animal. ain proceeds, "or as swift as an ostrich which," &c., r to introduce the ostrich.

loose structure of the poems explains the fact that very early period particular pieces were culled from works and recited by themselves. For the towns of later times this procedure was especially convenien em the wild ass or oryx-antelope had little attraction; the camel they bestowed about as much notice as on our dray-horses and waggons. But the love and he pride and scorn, the fierce lust of revenge and the g grief, the bravery and the gaiety, which breathed h the old Bedouin songs, had an intense fascination m. We see that their attitude towards that poetry some degree approximated to our own. Hence it is me anthologies from the old poetry, made by men of learning and ability, with an eye to contemporary are on the whole much more pleasing to us than th plete poems themselves. This is eminently true excellent collection edited by Abú Tammám, himself siderable poet (first half of the 9th century), und title "Hamása" (Valour). This collection, which, ho embraces many pieces of the Moslem period, is ex fitted to give a European a rather too favourable i ancient Arabic poetry. Whoever wishes really to that poetry and without this knowledge it is imp to understand the Arabs themselves or their langu must betake himself to those which, like the Mo'allak others, have been preserved more or less in their int

The Mo'allakat have been repeatedly printed, separate collectively, both in the West and the East, generally w Arabic commentary. A good commentary by a competent E is a real desideratum. A work of this kind would do more understanding of the poem than any poetical translation must always fail in rendering the delicate concrete expres the Arabs for which we possess neither the idea nor the ma translation must either be a mere paraphrase or else substitu thing utterly worse. (H

MOBILE, a city and port of entry of the United S the capital of Mobile county, and, though not the l the largest city of Alabama, lies 140 miles east o Orleans, on a sandy plain on the west bank of river, one of the arms of the Alabama. The mu boundary includes an area about 6 miles long or 3 m breadth, but, the suburban scattered about the nearer hill, the portion occup the buildings of the city proper is not more than square. In the matter of paving and trade the are generally good, and Government Street esp with its fine oak trees and garden, forms an att promenade. Beside the spacious granite building in 1859 to accommodate the Custom House, the Post and the United States courts the principal edifices Roman Catholic cathedral of the Immaculate Con (1833), Christ Church (Episcopal) (1837), the Cit pital (1830), the United States Marine Hospital (the Providence Infirmary, the conjoint market hou municipal buildings, Barton Academy (occupied high school), and the Alabama Medical College (fo in 1859). About 6 miles out, at Spring Hill, Jesuit College of St Joseph, established by Bishop in 1832. As a commercial centre Mobile is in s speci very favourably situated. It is the only Alabama, the estuary on which it stands is the ou several navigable rivers; and it is the seaward te of the Mobile and Ohio railroad, the Mobile and gomery, and the Grand Trunk. But, on the other it lies 25 miles from the coast, the lagoon like b cut off from the Gulf of Mexico by the narrow isth Mobile Point is extremely shallow, and in 1879 no drawing more than 15 feet could load and unl the harbour with safety. Since 1827, it is true, work have been undertaken to improve the appro the Choctaw Pass and the Dog River Bar, whi formerly a depth of little more than 5 and respectively, were deepened to 17 feet by 188 Mobile will not take rank as a satisfactory ocean p the scheme (operation) for constructing channel more than 20 feet deep right through the been fully carried out. The cost of the new survey being beyond the power both of the city and Stat gress has granted $70,000 for the purpose of w the channel to 200 feet, and deepening it to 25 f private company, established in 1876, has built a water in the bay, and greatly increased the safety harbour. For the years between 1855 and 18 average value of exports and imports was resp

9,266 and $711,420; the following figures for recent ow a considerable decline on the total:

	Export	Import
77	$1,374,171	$864,401
	9,495,306	1,115,112
79	6,219,818	511,678
0	7,188,740	425,019
1	6,695,140	671,252
	665	396,753

ton which form the staple export the falling off is pe cotton trade, 2,308 bales being the average for 1880 to 1 365,915, 392,709, and 295,040 bales the quantities for 0 and 1881. A great deal of what come to the Mobile nt to New Orleans for shipment, partly that it may higher price as "Orleans" cotton, lumber, shingles, d, cotton, hides and wool, and cotton are also important ut do not make in the aggregate so much as half the value otton. Among the local industrial establishment are pommercial mills, cooperages, shipbuilding yards, , and sash and door works. The market gardens of the produce a large quantity of cabbages, potatoes, water tomatoes, &c., for supply the cities of the western and 1870, $411,270, 1880, $171,480, 1881, 1882, $367,191, 1883 (estimated $700,000). Though it has never been a fashionable resort, Mobile had 31,560 the figure for the municipal district in 1880) in 1890, 29,132 (1880), 29,258 (1870), and 32,034 (1870). fied as a port by Lemoyne d'Iberville (le Moyne) in 1702, esteemed to be the capital of the colony of Louisiana till here the seat was transferred to New Orleans. The re by Lemoyne were probably about 90 and above the pre ation, which however appears to have been much exceeded after the flood of 1711. Treaty of Paris, 1763, Mobile and part of Louisiana were to Britain; but in 1780 the fort (now Fort Charlotte) was (by an expedition sent from Cuba) and in 1783 it was recog Spain by treaty with other British possessions on the Gulf of Mexico. Governor William C. C. Claiborne, appointed governor of Louisiana territory, recovered in for Lemoyne on the 16th of April 1813, though the population exceed 2000. It was incorporated as a city. In 1814–15 and the neighbourhood was the scene of important military de operations. The British fleet and troops (1814) were lines of defence erected about the district of West Florida Lawrence, and the capture of Fort Morgan (sometimes spoken of Fort Bowyer, before its recent extension). A municipal Mobile had to struggle with financial difficulties. In 1879 city charter was repealed and a board of commissioners hed for the liquidation of the debt (see § 197–200).

BIUS, AUGUST FERDINAND (1790–1856), astronomer athematician, was born at Schulpforta, November 17, 90. At Leipsic, Gottingen, and Halle he studied r years, ultimately devoting himself to mathematics tronomy. In 1815 he settled at Leipsic as privat- and the next year became extraordinary professor ronomy in connexion with the university. Later director of the university observatory, was elected (1848–49) under his superintendence. ll he was elected ordinary professor of higher and astronomy, a position which he held till 26, 1868. His doctor's dissertation, *Specimen calculationis per plicas*, brought established his reputation as a theoretical Die Hauptsätze der Astronomie* (1836), *Die Lehre von den Kometen* (1843), may be noted st for their perfect mathematical publications. Of special interest, however, are his labours in pure , which began for the most part in Crelle's al from 1827 to 1832. These papers are chiefly nical, many of the leading developments and appli s of the method laid down in his great work, *Der ycentrische Calcul* (Leipsic, 1827), which, as the name s, is based upon the properties of the mean point or of mass. Any point in a plane (or in space) can be ated as the mean point of three (or four) fixed by giving to the proper weights or coefficients. ous principle which leads in the hands of Mobius t revolution is the chief novel feature of the work, a system of homogeneous coordinates. Besides this ever, the work abounds in suggestions and foreshad of some of the most striking discoveries in more times such, for example, as are contained in Gras *Ausdehnungslehre* and Hamilton's *Quaternions*. H be regarded as one of the leaders in the introduc the powerful methods of modern geometry that hav developed so extensively of late by Von Standt, Cr and others.

MOCHA, a town of Yemen on the coast of the R m E. long. 43° 20′, N. lat. 13° 19′. The point of th where Mocha lies appears to have owed early anchorage, for the Muza of the *P (Comm. Or. Mar.* i. 2–3 *sqq.*), a great seat of the R trade in antiquity, seems to be identical with the Muzá (Yakut iv. 680, Niebuhr, *Desc. de l'Arabie*, p a few miles inland from Mocha. Mocha itself is a towns, which rose with the coffee trade into short-lived perity. The French expedition of 1709 found it a some 10,000 inhabitants, and its importance had in half a century later, when Niebuhr visited it. Th trade was then with British India. Lord Valencia i still found the town to present an imposing aspect, two of the minarets and lofty buildings; but the town had sunk to 5000. The internal disorders of and the effort of Mohammed Ali to make the coff again passed through India accelerated its fall, and th is now a mere village. Mocha never produced coff lies indeed on a quite waterless plain; the European Mocha coffee is derived from the shipment of coffe The patron saint, Sheikh Shadali, was, according to the founder of the city and father of the coffee trad

MOCKING BIRD, or Mock Bird (as Charleto and Catesby wrote its name), the *Mimus polyglo* modern ornithologists, and the well-known repres of an American group of birds usually placed am THRUSHES (*q.v.*), *Turdidae*, though often regar forming a distinct section of that Family, diffe having the tarsus scutellate in front, while the Thrushes have it covered by a single horny plat Mockers had inhabited the greater part of the States, being in the north only a summer visitan though breeding yearly in New England, is not there, and migrates to the south in winter, passi on to the Gulf States and Mexico. It appears t numerous on the western side of the Alleghanies, found in suitable localities across the continent Pacific coast, but not farther northward than Wa and is said to be common in Kansas. Audubo that the Mocking-birds which are resident all the ye in Louisiana attack their travelled brethren on the of the latter from the north in autumn. The n the poets, both English and scientific, have been l from the capacity of success fully imitating the cry other birds, to say nothing of other sounds, in add utterance notes of its own which possess a varied ra liquid tube- of tone that are unequalled, according admirers, even by those of the NIGHTINGALE (*q.v.*) opinion may perhaps be correct; but, from the of the only satisfactory judgment can scarcely now need, since a comparison of the voice of one bird can only be made from memory, and t comparison affected by associations of ideas which wo elude a true estimate. To hear either bird at its must be at liberty; and the bringing together of examples, unless it could be done with so many specimens as to ensure an honest trial, would be of litt Plain in plumage, being greyish-brown above a white below, while its quills are dingy black, va with white, there is little about the Mocking-bird's

yond its graceful form to recommend it; but the
gesticulations it exhibits are very attractive, and
its European rival in melody is far surpassed, for
k bird mounts aloft in rapid circling flight, and,
g on a conspicuous perch, pours forth his ever
g song to the delight of all listeners; while his
in attendance on his mate are playfully demonstra-
d equally interest the observer. The Mocking bird
over of familiar habits, haunting the neighbourhood
es, and is therefore a general favourite. The nest
d with little regard to concealment, and is not dis
hed by much care in its construction. The
ree to six in number, are of a pale blush green,
d and spotted with light yellowish brown. They,
as the young, are much sought after by snakes, but
rents are often successful in repelling these deadly
s, and are always ready to wage war against any
r on their precincts, be it man, cat, or hawk. Their
various, consisting of berries, seeds, and insects
twelve or fourteen other species of *Mimus* have been
mostly from South America, but *M. gilvus* ranges
to some of the Greater Antilles and *M. lecontei*
, while the Bahamas have a local race in *M. gundlachii*
called Mountain Mocking bird (*Oreoscoptes montanus*)
t very distant from *Mimus*, but, according to Mr Ridgway,
on exclusively the plains overgrown with *Artemisia*
tableland of North America, and not at all in
s, so that it is an instance of one order of birds
ecta allied to *Mimus*, those known as the Thr
s, and belonging to the genus *Harporhynchus*
eight species are found in North Am
like in their habits must be mentioned, but two

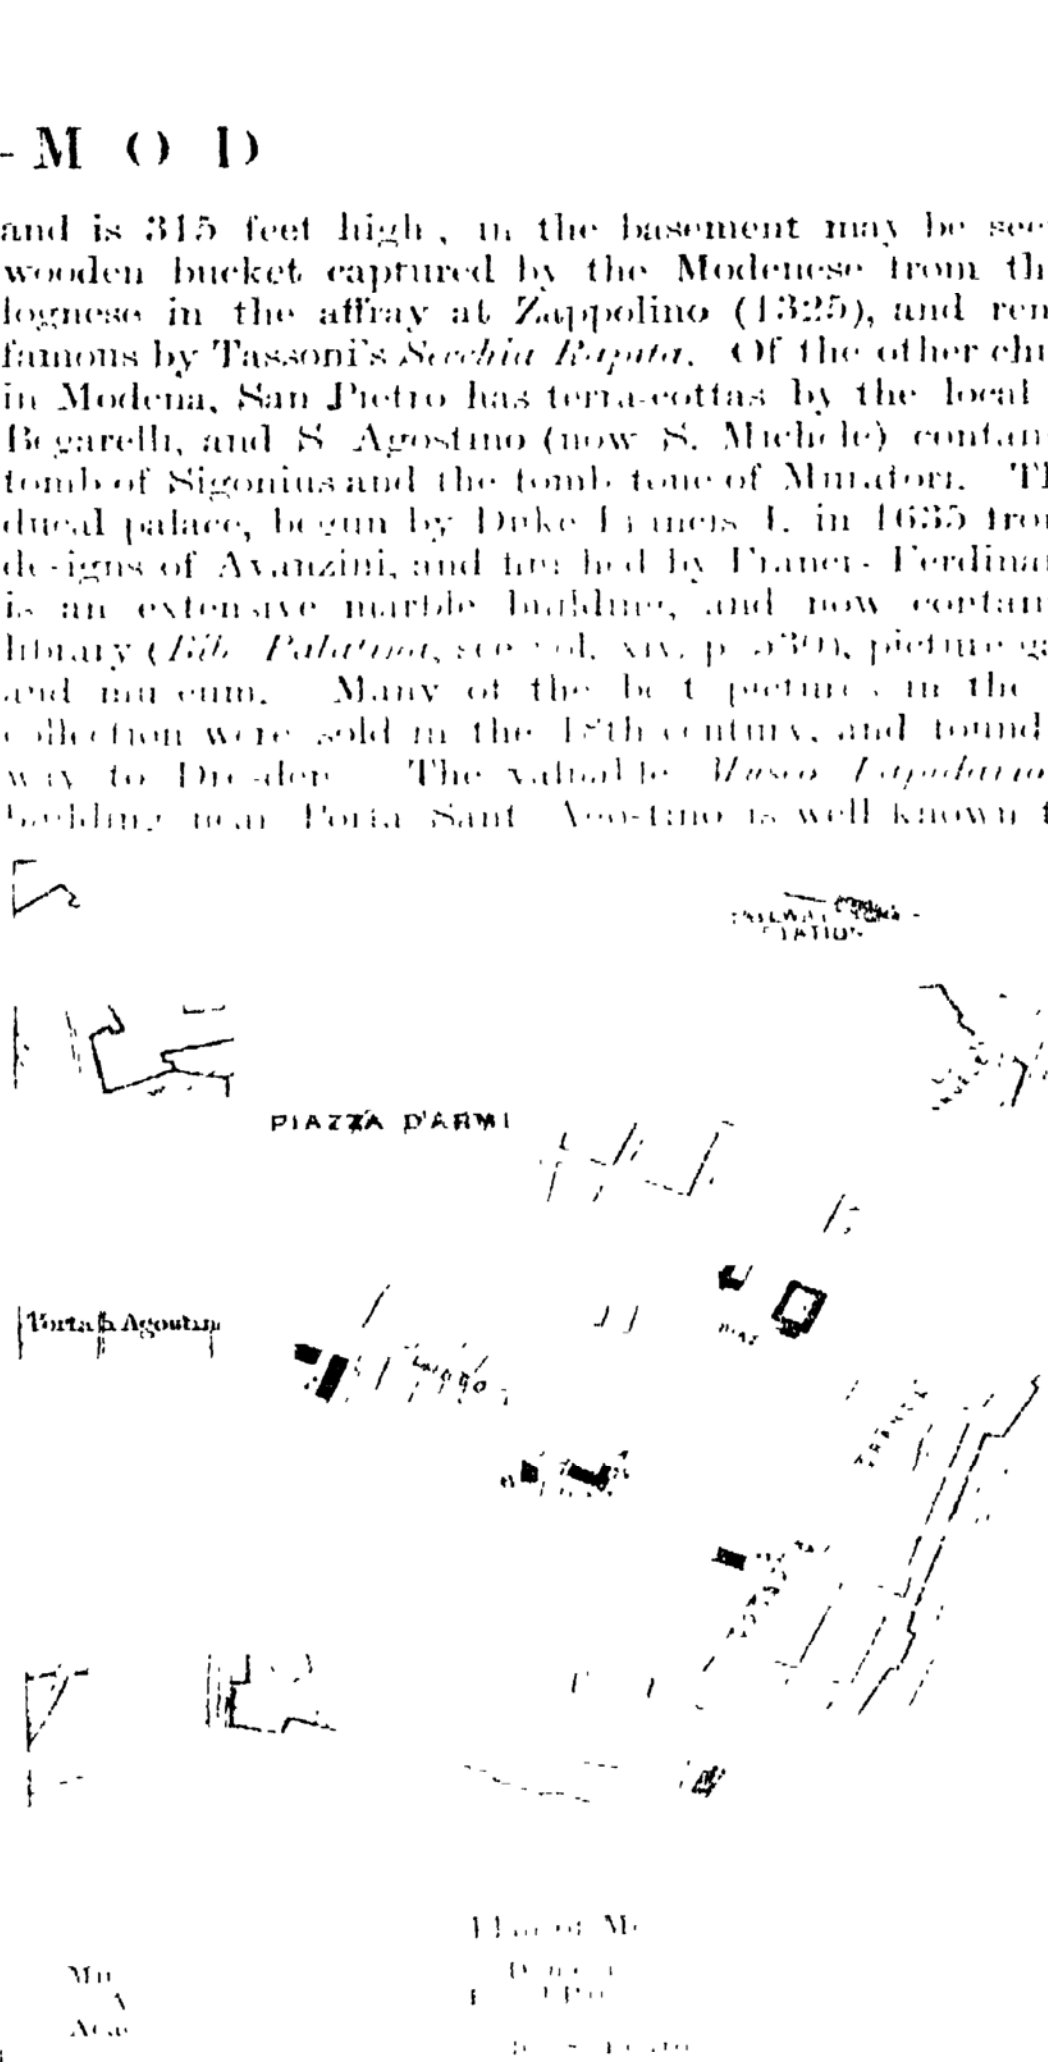
te, it is always welcome when mid-winter may become intimate
n's abodes. It has a much wider range on the American
nt than the Mocking bird, and is one of the few species that
ndered in Bermuda, while on more than one occasion it has
have appeared in Europe.

name Mocking bird, or more frequently Mock Nightingale,
nd occasionally given to some of the Warblers (*Sylviidae*),
lly the Blackcap (*Sylvia atricapilla*), and the Sedge bird
phalus schœnobænus). In India and Australia the name
s sometimes applied to other species.

DENA, one of the principal cities of Northern Italy,
rly the capital of a duchy, and still the chief town
rovince and the seat of an archbishop, is situated in
pen country in the south side of the valley of the Po,
en the Secchia to the west and the Panaro to the east
il it is 31 miles E.S.E. of Parma, 71 W.N.W. of
na, and 37 S. of Mantua. The observatory stands
eet above the level of the sea, in 44° 38′ 52″ N. lat.
0° 55′ 42″ E. long. Dismantled since 1846, and now
y converted into promenades, the fortifications still
the city an irregular pentagonal contour, modified at
orth-west corner by the addition of a citadel also penta

Within this circuit there are various open areas
pacious Piazza d'Armi in front of the citadel, the
gardens in the north-east of the city, the Piazza
le in front of the cathedral, and the Piazza Reale to
uth of the palace. The Emilian Way cross saddlingly
through the heart of the city, from the Bologna Gate in
st to that of Sant' Agostino in the west. Commenced
e countess Matilda in 1099, after the decrees of
ane, and consecrated in 1184, the cathedral (St
nian's) is a low but handsome building, with a lofty
, three eastern apses, and a façade still preserving some
as sculptures of the 12th and 15th centuries. The
ower, named La Ghirlandina from the bronze garland
nding the weathercock, is lined with white marble,



and is 315 feet high; in the basement may be see
wooden bucket captured by the Modenese from th
lognese in the affray at Zappolino (1325), and ren

DICA, a city of Italy in the province of Syracuse
y, 8 miles from the south coast, on the line of rail
ected in 1872 between Syracuse and Licata. It
ased its communal population from 30,517 in 1861
31 in 1881, and is a well-built and flourishing place.
among the public buildings are the old castle on
, the mediæval convent of the Franciscans, and the
of S. Maria del Carmine (1150) and S. Maria di
this last containing part of the ancient temple
ed by the earthquake of 1693. Modica is the point
hich the remarkable pebble tumuli, tomb and dwelling
f Val d'Ispica are usually visited. An early de-
y of Syracuse, Motyca or Motyca was in it. Cicero's
days a fairly important municipium. In modern
was held as a countship by the dukes of Alba.
Caraffa has written a prolix history of the city, whi
be found in Graevius, *Thes. Ant. et Hist. Ital.*, vol.

MOE, Jorgen Engebretsen (1813-1882), Nor
poet and comparative mythologist, was born at
Sigdal, Ringerike, Norway, on 22d April 1813, and
the university of Christiania as a theological student
age of seventeen. After leaving the university in
acted as tutor in various schools and families, and i
was appointed professor of theology in the Military
of Norway, which post he held until 1853, when he
resident chaplain in his native parish of Sigdal. In
received the living of Bragernes, Drammen; in 18
at Vestre Aker near Christiania; and in 1875 the bi
of Christiansand, where he died on 27th March 188

Moe's first publication was a volume of Norse "songs
of travel," which appeared in 1840; it was followed in
the *Norske Folke-eventyr* (Norwegian Popular Tales), which
collected along with his schoolfellow Asbjornsen. The work
such interest as a contribution to the study of comparative my
that in 1847 he was sent by the Government through Th
and Setersdal to increase his collection of stories. The
enlarged edition, with a preface by Moe, appeared in 18
1851 his *I Brønden væver Tornet* (In the Well and in the
delightful collection of prose stories for children, appeared
was followed in 1852 by a volume of poems entitled *En liden*
(A Little Christmas Present). In 1877 he prepared a
edition of his works in two volumes, the stories he had p
along with Asbjornsen being excluded. Many of the *Folke*
Dunbar Pieces from the Norse) were translated by Sir
Dasent in 1859.

MOESIA (in Greek Mysia, or, to distinguish it fr
country of the same name in Asia, Mysia in Euro
ancient geography the territory immediately to the s
the Danube corresponding in the main to Servia a
garia. It became a Roman province between 27 B
6 A.D., probably about 16 B.C.[1] In the time of T
and Caius the province was under the same govern
Macedonia and Achaia. It was divided by Domiti
two provinces, Mœsia Superior (Servia) and Mœsia
(Bulgaria); and the same emperor completed th
military road along the line of the Danube, increas
strength of the Roman forces in the country, and,
conquest of Dacia, saved it from the inroads by w
had been harassed from the time of Tiberius. The
invaded Mœsia in 250 A.D., and at last, in 395, a
of them, afterwards known as Mœsogoths, obtain
mission to settle in the province. The Slavonia
Bulgarians appear in the 7th century.

The boundary between Upper and Lower Mœsia was not
a. Ptolemy (iii. 9, 10) states, by the river Cebrus or

FFAT, Robert, D.D. (1795-1883), African mission- as born at Ormiston, Haddingtonshire, Scotland, ecember 1795, of humble parentage. Moffat learne ft of gardening, but in 1814 offered himself to the n Missionary Society, who, in 1816, sent him out to Africa. After spending a year in Namaqua Land, he powerful and dreaded chief Africaner, whom he ted, Moffat returned to Cape Town in 1819, and l Miss Mary Smith, a remarkable woman and most wife. In 1820 Moffat and his wife left the Cape oceeded to Griqua Town, and ultimately settled at an, among the Bechuana tribes lying to the west of al river. Here he worked as a missionary till 1870, e reluctantly returned finally to his native land. He frequent journeys into the neighbouring regions, a- th as the Matabele country, to the south of the si. The results of these journeys he communicated Royal Geographical Society (*Journ. R. G. S.*, xxv. and *Proc.* ii.), and when in England in 1842 he ed his well-known *Missionary Labours and Scenes th Africa*. Single-handed he translated the whole Bible into Bechuana. While solicitous to turn the to Christian belief and practice, Moffat was perhaps t to take a broad view of the missionary function, realize the importance of influencing the savage to the arts of civilization. He himself was builder, ter, smith, gardener, farmer, all in one, and by pre nd example he succeeded in turning a horde of irsty savages into a "people appreciating and ting the arts and habits of civilized life, with a language of their own." Now we find more or less anized communities extending from Kuruman to e Zambesi. Moffat met with incredible discourage nd dangers at first, which he overcame by his strong determination, and genial humour. It was largely him that the work of Livingstone, his son-in-law, e direction which it did. On his return to England, received a testimonial of about £6000. He died gh, near Tunbridge Wells, 9th Aug. 1883.

Scenes and Services in South Africa, the Story of Moffat's ary Labours, London, 1876; and publications of the London ary and the B. and F. Bible Societies.

GADOR, or Suerah (Berber *Tasaût*), the most rn seaport town on the Atlantic coast of Morocco, e capital of the province of Haha, stands from 10 feet above high water on a projecting ridge of cal s sandstone in 31° 30′ N. lat. and 10° 14′ W. long. tain states of wind and sea it is turned almost int nd, and a sea-wall protects the road to Safli. T are regular and, for a Moorish town, broad and clean. n the walls there are three distinct divisions, the s old and new with the government buildings, to rth-west the outer town with its spacious marke centre; and at the north-west corner the Mellah, ws' quarter. In the citadels the houses are fairly and considerable attention is paid to sanitary matters. is brought from the Kseb, about 1½ miles to the by an aqueduct. The prosperity of Mogador is due commerce; only a few gardens break the barren f the immediate vicinity. The harbour or roadstead, apparently protected by the island and quarantine of Mogador, is extremely dangerous during west uth-west winds. Trade is carried on mainly with illes, London, Gibraltar, and the Canaries, the prin cipal exports being almonds, goat-skins, gums, oli and ostrich feathers, and the principal imports cotton (half of the total) and tea. The average value of ports for the five years 1877 1881 was about £210,0 imports rather less. Attention has been frequently d to the value of Mogador as a health resort, especi consumptive patients. The climate is remarkably s mean temperature of the hottest month 71·06, of month 58·69. The annual rainfall is only 10 or 12 and the rainy days of winter and spring about 28. sirocco is but rarely felt. The population is about (7000 Jews, about 150 foreigners). Jews, Prote and Roman Catholics have religious edifices in the t

A place called Mogador is marked in the East Portion of t ventrum Library, and the map in Hondius's *Novus Mundus* sh island of Mogador *I. Domegatoor*, but the origin of the preser is much more recent. Mogador was founded by Sultan Moh and completed in 1770. The town received from the Mo name of Suerah (little pictured) which the Portuguese called the shrine of Sidi Mogadul, which lies towards the south h to the village of Diabat, and forms a striking landmark for In 1844 the citadel was bombarded by the French.

MOGHILEF, a north-western government or pr of the Russian empire, situated on the upper D between the provinces of Vitebsk and Smolensk north and east, Tchernigoff and Minsk on the sout west. In the north it is occupied by the water-shed separates the basins of the Dwina and the Dniep undulating tract from 650 to 900 feet above the se and covered nearly everywhere with forests. This shed slopes gently to the south, that is, to the v the Dnieper, which enters the province from the east and flows west and afterwards due south. southern part of the province is flat and has much in common with the Polyesie of the province of Minsk however, more habitable, the marshes being less ext

The province is covered in the Tertiary formation, D sandstone appears in the north, and Carboniferous lime ston east. The soil is mostly out clay-shale clay and potters not uncommon, and peat bogs, with a few patches of earth. The climate is cold and wet, the average yearly t ture at the Gorki meteorological observatory being 10 (11·2 in January and 63·8 in July), cold nights in sum often the cause of bad crops. The province has about 1, inhabitants (947,695 in 1870, mostly White Russians cent. belonging to the Greek Church, Jews are numerous cent.), Poles, belonging mostly to the nobility, make on cent. of the population. Agriculture is the chief occu nearly one half the surface of the province crop, but, except after unusually good harvests, corn is mostly by the navigable channel of the Dnieper and Sos are many distilleries on the estates of landowners, and wh is exported. The hemp cultivated is important, hemp and seed oil are exported to Libau. The province has some iron mill, a few iron and copper works, and minor manufactures.

The province of Mohilef is divided into eleven districts the chief town. Mohilef (46,500 inhabitants), Chausy (Chaikof 2900, Gorki (3,000 Gorki, formerly the se agricultural institute (Cohen, Krasnoi (7000), Mstislavl (Orsha 5350, Rogachef (2,0, Surazh Bykhof (3,700), and (2,500). Of these the other municipal towns are inhabi (13,000 inhabitants), Dubrovka (7000 Krichef (4000).

The province was inhabited in the 10th century by the and Radimichi. In the 11th century it became part of L and afterwards of Poland. Russia annexed it in 1772.

Mogilef on the Dnieper, a town of Russia, of the province of the same name, is situated on bank of the Dnieper 10 miles south of the Orsha of the railway between Moscow and Warsaw. A along the Dnieper will soon bring Mogilef into communication with these capitals.

Mogilef is mentioned for the first time in the 14th as a dependency of the Vitebsk or of the Smolensk pro At the beginning of the 15th century it was the property of the Polish kings. But it was successively p etted by Russians, who attacked it six times dur 16th century, or by Cossacks, who plundered it three ti the 17th century its inhabitants who belonged to the Greek suffered much from the persecutions of the Latin

MOHAMMEDAN EMPIRE

English Miles

MOHAMMEDANISM

UNDER this head is given the history of Mohammed and his successors to the fall of the Eastern Caliphate, with a sketch of the institutions and civilization of the Moslem empire and an account of the Koran. The later history must be sought under the names of individual countries, dynasties. What falls to be said of the social and religious aspect of Islam in modern time will be given under the two great divisions of SUNNIS and SHI'ITES.

PART I. MOHAMMED AND THE FIRST FOUR CALIPHS.

MOHAMMED[1] or MAHOMET, the founder of Islam, first appears in the full light of history with his Flight to Medina (The Hijra), A.D. 622, and the date, not that of his birth, has been intimately chosen as the epoch of the Moslem Era. The best attested tradition places his first appearance as a prophet in Mecca some twelve years earlier (*circa* 610). He was then forty years old; the forty must be taken as a rounded number but as such is doubtless trustworthy. Thus the birth of Mohammed falls about 570 A.D.—it is not to have been in the year when Abraha, the Abyssinian viceroy of Yemen, led the expedition against Mecca, mentioned in the Koran when the Arabs first saw the elephant and first suffered from smallpox.[2]

At the time of Mohammed's birth and youth other events seemed less likely than that the Arabs should presently make their triumphal entrance into the history of the world as victors over the Greeks and Persians. Nowhere in the Peninsula was there an independent state of any considerable power and importance. At the beginning of the 6th century indeed the princes of Kinda had attempted to form a national kingdom, uniting in particular the tribes of central Arabia; but the kingdom was nothing more than an epic prelude to the true history of the Arabs, which begins with Islam. After the fall of the Himyarite dynasty, the old anarchy reigned supreme among the nomads of the Nejd and the Hijaz; in all other quarters Greek or Persian influence predominated, extending from the frontier deep into the interior by the aid of two vassal states, the kingdom of the Ghassanids in the Hauran under Greek suzerainty, and that of the Lakhmids in Hira and Anbar under the Persian empire. The antagonism between Byzantium and Ctesiphon was reflected in the feud of the Arab lordships[3]; but indeed the rivalry of Greek and Persian exercised its influence even on the distant South of the Peninsula. Urged on by the Greeks, the Abyssinians had overthrown the Christian hegemony of the Himyarites, the sunken remnant of the ancient might of the Sabæans (A.D. 526), the Persians had helped a native prince again to expel the Christians (*circa* 570), and since then the Persians had retained a footing in the land. Toward the close of the 6th century, their direct and indirect influence in Arabia greatly surpassed that of the Greeks, and since the Kindite dead fallen before the Lord of Hira, it extended right down to the Nejd into Yemen.[4]

In the Hijaz and western Nejd, the district from which Islam and the Arab empire took their beginnings, Greek and Persian influences and Ghassanid and Lakhmid rule had not made themselves felt. The nomad tribes, and the few urban communities that existed there lived their own life entirely under Arab forms, after the manner of their father-city Mecca, which the Banu Khuzaa had formed a settlement round the Ka'ba, the sanctuary of a number of tribes destined to be associated with Mecca but belonging to that district. The Ka'ba was annually observed on the day before the full moon of the month Dhu'l Hijja at Mecca and at 'Arafa and Kozah, the vicinity, presented scenes of attraction for all inhabitants of the Hijaz, and grew into a great fair, at which the Meccans sold to the Bedouins the goods they imported from Syria. Feast and fair gave the city the prosperity which it shared with other cities which, like Mecca, had the advantage of lying near the meeting-place of the great natural road to Yemen—that from the north where the Red Sea coast, and that from the north-east following the line of the mountains that traverse the Nejd.

By these trading journeys the Koraish had acquired knowledge of the world, especially of the Graco-Syrian world; the relative superiority of their culture raised them not only above the Bedouins, but above the agricultural population of such a city as Medina; the art of reading and writing was pretty widely diffused among them.[5] The Koraish within the city were the Banu Kathir and Lo'ayy, those in the surrounding country Banu 'Abd Manaf and Sahm; the town-men proper were again subdivided into Makhzum and Nofal; the latter were the new-comers, who withdrew from the old settlers by the more recent of the other Arabian towns, as Taif and Hira. The community was a mere confederation of near kindred; separate quarters occupied by its own quarter, there was no private property, towards each had no civil duty. Only for hostile attack in the general interest were they held together under the leadership of the Koraish who dwelt in the quarter nearest the Ka'ba, the Hashimites (the house of 'Abd al-Muttalib), the 'Abd Shams (the house of Umayya), and the Nofal (the house of Abd al-'Uzza, afterwards called Umayya).[6] Each quarter had its own chief, the Hashimite (the house of 'Abd al-Muttalib), the 'Abd Shams (the house of Umayya), and the Nofal (the house of Abd al-'Uzza, afterwards called Umayya).[7

Mohammed [illegible] Abdallah b. 'Abdalmottalib, did not live to see the fourth, and in mother's [illegible] died while he was still a child. Mohammed was then cared for by his grandfather, 'Abdalmottalib, and after his death by his eldest paternal uncle, Abu Talib b. 'Abdalmottalib. He was [illegible] not rich, but shared the hard lot of a numerous and very poor family, he [illegible] as a shepherd [illegible] to the desert [illegible] to all [illegible] a natural development [illegible].

[illegible] Abu Talib, the [illegible] Mohammed, or the [illegible] he was [illegible] to [illegible] [illegible] [illegible]

"Read! in the name of thy Lord, who created, created man from a drop. Read! for thy Lord is the Most High who hath taught by the pen, hath taught to man what he knew not. Nay truly man walketh in error, when he deems that he suffices for himself, to thy Lord they must all return."

What is here recorded is the commencement, not of Mohammed's knowledge, but of his prophet-ship. That the latter was one to a vision experienced by him on a night of the month Ramadan (cxcvii. 1, xcvi. 1-5) is

he vision was connected by the traditional conception of revelation and prophecy which Mohammed had learned to accept. But, of course, uncertain whether the words in which the angel called the Prophet are really contained in xcvi. Certainly the [illegible] very early, and it contents are, indeed the best expression of the essential idea of Islam. Man live on context with himself, but he must one day return to his Creator and Lord, and give account to him. This [illegible] the most vital principle of the whole faith of Islam, the formal principle of the very process of doctrine of revelation in writing, copied from the heavenly book.

When the angel left him [illegible] the tradition runs on Mohammed came to Khadija and recounted the occurrence to her in much distress. He thought that he was possessed. But she however comforted him, and convinced him that the belief that he had received a revelation and was called as a messenger of God. Yet he doubt returned when the revelation broke in the revelation, and they reached a climax in height. He was often on the point of [illegible] death by casting himself down from Mount Hira. It is usually assumed that the [illegible] of angels lasted from two to three years. Then the angel [illegible] to have suddenly appeared a second time, he came to Khadija in great excitement and said, "Wrap me up! wrap me up!" This, it must be explained, was done when in bed in the women's and on this occasion often the matter, the revelation came during an attack. The [illegible] down and [illegible] commune with the deity. "O thou enveloped one! henceforth there was no [illegible] and no doubt, the revelations followed with [illegible] and the Prophet was fired of his vocation.

That Mohammed did pass through many doubts and much distress before he reached the [illegible] was believed (in xcvii. 3), but the [illegible] development of the doctrine of the [illegible] or interval of from two to three years between the first and second revelation, before a later stage of tradition. It appears that it was [illegible] to dispose of the controversy whether Mohammed [illegible] a prophet in Mecca for ten or for twelve years. Perhaps, too, it was designed to solve another [illegible] whether cxvii. or cxi. was the beginning of the revelation—a question that [illegible] to the [illegible] claims of each. The tradition [illegible] by the [illegible] that Mohammed in the first three years of his mission did not appear in public, but only called [illegible] and the [illegible] Allah in private circles. But, he [illegible] the [illegible] own house, in the Khatim, he [illegible]

radition has it that he found comfort in the fact that at
ast the Jinnis listened to him as by the way he chanted
e Koran in the sacred grove of Nakhla.[1] In the present
ircumstances it was now impossible for him to return into
e town, after having openly announced his intention of
aking with it and joining another community. He did
t venture to do so until, after long thought and negotiat
had assured himself of the protection of a leading citizen
of Mecca by 'Ath. Notwithstanding all that had happened,
resolved, two months after the death of Khadija, to enter
on a second marriage with Sauda bint Zam'a, the widow
an Abyssinian emigrant.

Chance soon afterwards brought to pass what some
ought (on his journey to Tayif) had failed to accomplish
ter having given up the Meccan Mohammed was wont
seek interviews with the Arabs who came to Mecca
ajjumu Dhu'l Majaz and 'Okaz for the purpose of trade
nt in the fairs and feasts, and to preach to them. On
e such occasion, in the third year before the Hijra
p. 619 620), he fell in with a number of men from
Medina, who to his delight did not run like those
nally the case but showed both aptitude to understand
d willingness to receive his doctrine. For all this they
d been previously prepared [by the disciples] who
me with the numerous Jews who lived among them
th them in their towns and neighbourhood, and by the
nnections which they had with the Northern and
rth-eastern Arabs of the tenth. Hanifism was especially
idely diffused among them, and at the same time there
re movements of expectation of a new Prophet
en of an Arabian Messiah who would bring to Mecca
e the proper call for Mohammed to step on to the stage
at he owed such a discovery to account of. He entered
to closer relations with the pilgrims who had come from
ence, and asked them to try to find out whether
as any likelihood of his being received in their town.
ey promised to do so, and to let him hear from them in
e following year.

At the pilgrim feast of next year, accordingly, twelve
tizens of Medina had a meeting with Mohammed, and
ve him their pledge to have no god but Allah, to with
old their hands from what was not their own, to the for
eation, not to kill new-born infants, to limit lusts, and
obey God's messenger as far as was fairly to be asked of
his is the so-called First Homage on the 'Akaba. The
lve men now returned, as propagandists of Islam, to
eir homes with the injunction to let the matter bear
the success of their efforts at the same place on the
llowing year. One of the Meccan Moslim, Mus'ab b.
Umair, was sent along with or after them, in order to teach
e people of Medina to read the Koran, and instruct them
the doctrines and practices of Islam.

Islam spread very quickly on the new soil. It is easy
understand how his joy strengthened the Prophet's
irit to try a higher flight. As a symptom of his exalted
ame we might well regard his famous night journey to
erusalem (sur. xvii. 1; vi. 2), if we could be sure that it

[1] Sur. xlvi. 28; lxxii. 1. On the unpolemical character of the
e date of this occurrence see Nöldeke, *op. cit.*, p. 101.

[2] Muir (ii. 181 *sq.*) assumes, with good reason, that he had already
one so during the time when he was living in the shadow of Abu Talib's
d assigns to this period the story that Abu Lahab followed him in
s in order to counteract his preaching, and so forth among the
heat.

[3] Sprenger (ii. 526) identifies this meeting with the first, which tra
tion distinguishes from it and places a year earlier. He is probably
ght.

[4] Afterwards this was called the women's oath. It is a noteworthy
ummary of the features by which Islam is distinguished from
eathenism.

[5] On the 'Akaba compare *Wakidi*, pp. 117, 197, 429. It was a
ation between 'Arafa and Mina.

belonged to this period.[6] The prophecy about the final
triumph of the Romans over the Persians (contained in
sur. xxx. 1–7) might very well pass for an expression
of even a remnance of victory, at the time he still had
feeling of solidarity with the Christians. But this prophecy
(the only one contained in the Koran) [illegible] would
appear to a much later date.[7]

At the Meccan festival in the last week before the Hegira
(in March 622) there presented themselves among the pil
grims from Medina seventy-three men and two women who
had been previously converted. Both by night after the day
the brother they had arranged with the Prophet
to the effect that Mus'ab [illegible]
death had become known to the Meccans
present. The [illegible] of the

other matters. But [illegible]
Prophet, engaged [illegible]
other matters. But [illegible]
necessary efforts and [illegible]
ears. A few days [illegible]
Muhammed and to [illegible]
emigrate. In the first month of the following year of the

[illegible] Flight (April 622) the emigrants [illegible] within two
months some 150 persons had reached Medina. Abu
Bekr alone and 'Ali remained behind in Mecca.

Muhammed himself remained in the house in Mecca in the
company of Abu Bekr and 'Ali. His reason for doing so
is to be sought in the connexion of the following events. The explan
tion offered of the Prophet's action by the Meccans
has a motive in every respect [illegible] which he secretly
withdrew from with Abu Bekr [illegible] two or three days the
two fled [illegible] in a cave of Mount Thaur
south from Mecca, till the pursuit should have pas
over. Then they took the northward road
and arrived [illegible] on the 12th or 16th of Rabi' of the
first year of the Hijra. Meanwhile 'Ali remained [illegible]

[8] The 12th of Rabi', according to Ibn Ishaq, the Prophet's birt
day, the day of his arrival in Medina, and the day of his death.
is certain that he died at mid-day on Monday the 12th of Rabi',

days longer in Mecca, for the purpose, it is alleged, of restoring to its own all the property which had been entrusted for safe keeping to the Prophet. The Koraish left him entirely unmolested, and threw no obstacle in the way when at last he also took his departure.

With the Flight to Medina a new period in the life of Mohammed dawns. Great a revolution in the circumstances of any man. Had he remained in Mecca he would in the best event have died for his doctrine, and its triumph would not have come until after his death. The Hijra brought it about that the founder of a new religion lived also to see it completely established. That in his case was united all that in Christendom is separated by the enormous interval between Christ and Constantine. He knew how to unite Islam and the state, founding the Arabian empire. That the new standpoint for the religious reformer under these circumstances was peculiarly difficult soon became apparent. It soon became the duty of its leader sometimes, for almost from the first it became mixed up with the duties of practical administration. In addition to the task of securing the capability of development which attached to all true religion, Mohammed received a special heritage from Mohammed the hope which it had never ceased to entertain. It ought not however to be overlooked that the want of orderly and political traditions was partly due to the Arabian origin.

Mohammed in the first months took up his quarters in the outlying village of Kuba, where a great part of his most zealous adherents had their houses, and had already built a mosque. It was not until after some days had passed, and his host's family had given the first reception, that he removed to the city itself, which at that time bore the name of Yathrib. All were anxious to have him precede, that none might feel themselves slighted, he left the decision to the camel on which he rode. It sank down in an open space on the quarter of the Banu Najjar, which he accordingly selected as the site of the mosque and of his own house. At first the land quarters, or even months in the house of Abu Ayyub, within this interval the mosque was finished, which was to serve at once as the place of religious gathering and as the common hall. Over it was the Prophet's private dwelling, of the last of his wives, according to order of which he lived. At that time it consisted only of the sanctuary already mentioned, but soon increased in size, the youthful Arabs, the daughters of his friend Abubekr, who acquired great influence over their young husband, the lofty enclosure built round it, the row of huts for the poorer brethren of the Koreish who had emigrated with him, and the dwellings for the people of Medina.

... situated on a west-ward part of the Arabian ... ed to the Wadi Kanat. It ... an ... ...

Mohammed thus laid the foundations of his position in a manner precisely similar to that which Moses (Exod. xviii.) is said to have followed; and just as the Torah grew out of the decisions of Moses, so did the Sunna out of those of Mohammed. It was perhaps in judicial and regulative activity, which he continued quietly to carry on to the very end of his life, that his vocation chiefly lay. At all events his work in this direction was extremely beneficial, if only because he was the creator of law and justice where previously there had been nothing but violence, chance, or at best voluntary arrangement. But the content of his legislation also (if it can be called by such a name) marked a distinct advance upon what had been the previous use and wont in Arabia. In particular, he made it his special care to set a fence round the right of property, and to protect and raise the place of woman in marriage. Blood revenge he retained indeed, but completely altered its character by reserving to himself the right of permitting it; in other words, the right of capital sentence. It need not be said that in many ways he availed himself of that which already existed, whether in the form of Arab usage or of Jewish law; he followed the latter, in particular, in his laws relating to marriage.

The new situation of affairs inevitably brought it about that religion was made a mere servant in the work of forming a commonwealth. Never has this service been better performed; never has it been rendered with greater adroitness as a means towards this end. In Mecca, Islam had originally been nothing more than the individual conviction of Mohammed; it was only after severe struggles that he went so far as to preach it, and even his preaching had no other aim than to create individual conviction in others. What he said was of the simplest description: that people ought to believe in God and in judgement to come, that men ought to live their lives soberly and not waste them in follies, that one ought not to be high-minded or covetous, and so on. A community arose, it is true, even in Mecca, and was confirmed by the persecutions. There also religious meetings were held and sacred prayers; but everything was still in a very timid and rudimentary stage: religion retained its inward character. It was not until the first two years after the Flight that it gradually lost this, and became, if not exclusively, yet to a very large extent, a mere drill-system for the community.[1] No good but the one God (lá iláh illa lláh) was the entire sum of their dogmatic, and less importance was attached to belief in it than to profession of it. It was the watchword and battle-cry. The prayers[2] took the form of military exercises; they were imitated with the greatest precision by the congregation, after the example of the Imam. The mosque was, in fact, the great exercising-ground of Islam. It was there that the Moslems acquired the *esprit de corps* and rigid discipline which distinguished their armies.

Next to the monotheistic confession (tauhíd) and to prayer (salát) came almsgiving (zakat, sadaka) as a third important means by which Mohammed awakened and brought into action among his followers the feeling of fellowship. The alms by and by grew to be a sort of tithe, which afterwards became the basis of the Moslem fiscal system and so at the same time the material foundation of the Moslem state. Religion received so practical a development that of alms nothing but the name remained, and the convenient notion that the taxes had to be paid to God.

Just in proportion to the closeness of the union into which Islam brought its followers did its exclusiveness towards them that were without increase. If in Mecca Mohammed in his relations to the other monotheistic religions had observed the principle, "he that is not against me is for me," in Medina his rule was "he that is not for me is against me." As circumstances were, he had to do just mainly with the Jews. Without any intention on their part, they had helped to prepare the ground for him in Medina: he had great hopes from them, and at first treated them on no different footing from that of the Arab tribes which recognized him. But as his relation with the Jews and Khazraj consolidated, those which he had with the Jews became less close. The conjunction of religious with political authority, the development of civil polity out of religion, of the king but from the prophetic function, was precisely what they objected to. On the other hand, while the old polity of Medina broken up and disorganized as it was, had no difficulty in tolerating foreign elements within its limits, the new political system created by Islam changed the situation, and rendered it necessary that these should be either assimilated or expelled.

Mohammed's hostility to the Jews found expression, in the first instance, theoretically rather than practically, and especially in the care with which he now differentiated certain important religious usages which he had taken over from Judaism, so that they became distinguishing marks between Islam and Mosaism. Thus, for example, he altered the direction of prayer (kibla), which formerly used to be toward Jerusalem, so that it now was towards Mecca; and for the fast on the 10th of Tishri ('Ashura) he substituted that of the month of Ramadan.[3] In appointing Friday as the principal day of public worship, he may also possibly have had some polemical reference to the Jewish Sabbath. Of these alterations the greatest in positive importance is the transference of the kibla to Mecca. It symbolizes the completion of the Arabian process which went on step by step with the changes Islam underwent from being an individual to become a political religion. In substituting the Meccan Ka'ba for the sanctuary at Jerusalem, Mohammed did not merely bid farewell to Judaism and assert his independence of it, what he chiefly did was to make a concession to heathenism, and bring about a nationalization of Islam, for the purpose of welding together the Arab tribes (Kabáil) into one community. Of similar significance was the substitution of the feast of sacrifice (Aid al-dohá) on the day of the Meccan festival. The Moslems were to observe the latter as much as possible, even if they could not be actually present on the spot.

Thus we have the two chief precepts of Islam: (1) Confession of the unity of God, (2) stated prayer, (3) almsgiving, (4) the fast of Ramadan, (5) observance of the festival of Mecca. Capable of having deeper meaning

[illegible] the fact of uniting the Arab politically, [illegible] the Jews had no such effect. [illegible] contrary, the original feud and hatred in which [illegible] did greatly to the advantage of the Moslems. [illegible] recognition of Mohammed's supremacy as a fact but [illegible] title therefore to examine from his prophetic office

[1] This is to be understood as applying to the system as a whole. Of course, there are always individuals who break through it; but the historical power of Islam rests upon the system. To the system also belongs the spiritual jargon which Mohammed introduced. It was no longer permissible to say "Good morning!" Um sabahtan, the phrase now ran, "Peace be with thee!" and on every occasion pious forms of speech were demanded. Characteristic of the puritanism of the system is the prohibition of wine and of gaming, first issued in the years immediately following the Flight, and the contempt for poetry.

[2] They were five in number—at sunrise, noon, afternoon, sunset, and late evening. Each prayer consisted originally of two, afterwards of four, prostrations. The chief weekly public service (jom'a), with sermon, was held on Friday at mid-day.

[3] Compare the well-known second sura, [illegible] week on Judaism.

[4] A connection with the Christian fast is [illegible] possible that Christian influence may have [illegible] of the fasts, but it cannot have anything to do with the [illegible] Ramadan; for in the first year after the Flight, Ramadan fell not Spring but in December.

ttached to them, but no criterion also, even in a merely
xternal observance, they were an excellent instrumentality
or producing that *esprit de corps*, that obedience to Allah
nd his messenger, which constituted the strength of the
Moslem system. I pt till that time blood relationship had
all relation in
pon such a foundation it was impossible to rai
ommunity, either, for blood dissociates as much as it
Rut now, wherein consisted upon the removal
of the great obstacle in building the social structure,
ossible by breaking up the old organization, in order to
ecast the thus disintegrated element into a new and
uch more stable system. The very heart of men were
hanged, the ancestry of the old religion hopelessly lost
ith the decease of Abu Talib brother would have lain brother
and Mohammed wished it. The best Moslem was he who
as the most resolute in separating from the old and
ttaching himself to the new. Mohammed gave preference
o active natures over it they occasionally kicked over the
ace, to contemplative piety proceeding from him only the
ure of word. Over the wretched rule of a matte
ode of trouble the old sacredness of blood came back
ampered, the object were united by the bond of
ood. Every Moslem was now a Moslem's brother, and,
matter of course, took his part against every non-
Moslem. Outside of Islam there was no other law nor
afety. Allah alone was powerful, and he protected those
nly who acknowledged his sole sovereignty.

The Companions (Mohagirun), who along with the Prophet
ad fled from Mecca were the kernel and the nucleus of
he community. It was made all the easier for them to
ive effect to the fundamental principle, that citizenship
n Medina depended not on family but on faith, because the
ative Moslems (Ansar, "the Defenders") were themselves
Aus and Khazraj reconciled one another by their mutual
nmity. Mohammed seems at first to have cherished the
esign not only of entirely disowning relationship with
on Mecca, but also of destroying as much as possible,
within Islam, the distinction of blood, by means of the
ommon faith. He even declared between emigrant and
ndividual citizens of Medina relationship of brotherhood,
which also involved heritage. But he soon abandoned the
ame, and expressly recognized the validity and sacredness
sunna Islama, of the old right of family and inheritance
Sura viii. 76). Thus he retained from carelessness not to
ut full logical consequence the theoretical principle of
qualization, but on practical ground permitted the old
rder of society to continue. Meanwhile a great period, he
ad conceded to relation-ship and the ties of blood far
more rights than were compatible with Islam and the
ould find the foundations of the violent quarrel which
ore the community, more particularly in the time of the
Omayyad. Similarly it might be said that communism
as gradually involved in the principles of Islam, but it
s characteristic that from the first the aims were less em
loyed to the equalization of society, than for transferring
the hands of the ruling power. It frequently happens that
religion receives its final expression also in the form of
ocial polity, but it is remarkable to observe how Islam
nalyzed the religious heaven from the first for a positive re
rganization of society, and neutralized the destructive
endency which that heaven is wont to show in political
affairs. It did not indeed succeed in totally destroying the
adical tendency, as the history of the caliphate shows.
But, on the whole, the equality before God which Islam
eaches interfered hardly at all with the subordination of
men to their human leaders. Both were demanded by
eligion, both were taken seriously and each was found,
in practice, reconcilable with the other.

That this new and drastic principle, thrown into the
chaos of existing relations, must have exercised a migh
power both of attraction and repulsion is obvious. Mo
than one naive expression bears witness to the astonis
ment with which the Arabs regarded the strange spir
which animated the community of the Moslems: the fir
ess with which they held together, the absolute and wi
ng obedience which they gave to their leaders, the rec
lessness with which they disregarded everything that befo
Islam, or outside of it, was looked upon as holy. Son
nature felt themselves attracted by these peculiaritie
especially if on other grounds they felt little difficulty
severing themselves from their old connexions; but, on t
whole, feeling of antipathy prevailed. Even in Medi
itself the antipathy was widespread. The so-called hyp
crites (monafikun) were either only half attached to t
Prophet or to their innermost hearts unfavourably dispose
they were kept from overt action partly by the absence
a decided opinion, partly by the terrorism which the co
vinced Moslems exercised. The reproach of hypocri
brought against them means chiefly that they did n
manifest a full acceptance of the new political relation
They could not reconcile themselves to the position
became never a word to say in their own town, and
being compelled to obey the Prophet from Mecca and the
who had come with him. For a time the danger w
imminent that all Medina (the Emigrants of course e
cepted) might be infected with hypocrisy, if one may c
it hypocrisy when for a moment nature and blood assert
themselves against religious discipline and burst its bon
The younger portion of the community, however, was
the whole enthusiastic for Mohammed; the hypocri
were for the most part older men, especially heads
families, who could not at sufficient to put up with the loss
political influence which they were suffering. As chief
their number Ibn Obayy is always named, the forem
man of Medina, whom the Khazraj had thought of crow
some days before matters were so fundamentally chang
by Islam. Mohammed's attitude towards him and t
hypocrites in general was that of connivance, - thorough
appropriate here, where political rather than religious affa
were involved, and the question was one less of princi
than of power.

The foundation of the state upon the feeling of fellows
generated by religion, was without question the Proph
greatest achievement: the community of Medina was
tool, its heroic faith the force, by means of which Isl
attained the result which figure so largely in the histo
of the world[1]. Moslem tradition, however, does not stop
inquire what it was that constituted the inward strength
Islam, but goes on at once to relate what were its outw
manifestations. Its information on the subject of the per
of Mohammed's sojourn in Medina is given under the title
"the campaigns (maghazi) of the apostle of God." W
a few of the smaller tribes in the neighbourhood of Med
(Dhamra, Mozaina, Ghifar, Aslam), and with the Khoza
Mohammed maintained relations of peace and amit
benevolent neutrality gradually grew into alliance, a
loyally union with the commonwealth of Medina. I
towards all the rest of Arabia his very principles pla
him in an attitude of war. Ever since Islam from be
a religion had become a kingdom, he was compelled
vindicate, by means of war against unbelievers, its cla
to supremacy; the conflict of principles had to be sett
by the sword, the sole sovereignty of Allah demonstra

[1] The credit of being the founder of the Moslem state cannot
transferred to 'Omar, but must be left with Mohammed. It was
'Omar who created that feeling of oneness which enabled him, for
example, suddenly to recall a general like Khalid from his career of vic
without exciting a murmur. The miracle is the "primitive cell"
Medina, not the fact that in course of time success gave it the forc
an avalanche.

y force to the rebels who showed unwillingnes- to accept
. More literally than Christ could Mohammed say of
imself that he was come not to bring peace but a sword.
slam was a standing declaration of war against idolaters
The nearest object against which to direct the holy war
jihâd) was presented by the Meccan- Against them first
id Mohammed bring into operation the new principle, that
is faith and not blood that separates and unites
ording to Arab notions it was a kind of high treason on
s part to leave his native town in order to join a foreign
ciety; on the part of the people of Medina it was an
t of hostility to Mecca to receive him among them
The Meccan would have been fully justified on their side
taking arms against the Moslem but they refrained
ing too much at their ease, and hesitating to do from
atricidal war It was the Moslem who took the initia
ive; aggression was in their blood Mohammed
an with utilizing the favourable position of Medina, on
mountain-spur near the great highway from Yemen to
ria, to intercept the Meccan caravans On six he
ent forth only the Emigrants to take part in the expedi
ion, as the people of Medina had pledged themselves to
efend him only in the event of his being attacked in
owever, they also joined him What first induced them
o do so was the prospect of booty afterwards it was im
ossible to separate them selves from the fortunes of
lements which had been quietly going on within the
mmble of Islam

The first plunder was taken in the month Rajab, year 2
Autumn 623), in which enormous interest was at once seen the
dvantage arising from the chance of conquest brought
bout by the new religion, for in Rajab tent and plun
ering raid were held to be unlawful Returning upon the
eredity of this month a caravan of Koreish was returning
om Syria laden with leather, wine, and raisins But
is did not prevent Mohammed from sending out a band
f Emigrants to stop the caravan at Nakhla, between
Taif and Mecca; his orders to this effect were given in a
ocument which was not to be unsealed until two days
fter the departure of the expedition. The plan was carried
ut, and the surprise was all the more successful, because
he robbers gave themselves the outward semblance of
ilgrims; one Meccan was killed in the struggle. But
he perfidy with which in this instance Mohammed's ad
anced religious views enabled him to utilize for his own
dvantage the pious custom of the heathen roused in
Medina itself such a storm of disapproval, that he found
himself compelled to disavow his own deed In Moham
medan tradition, the contents of the murderous document
in which he ordered the surprise are usually falsified

The Koraish still remained quiet, another outrage had
et to come. In Ramadan VII 2 (December 623), the
eturn of their great Syrian caravan was expected, and
Mohammed resolved to lie in wait for it at Bedr, a favour
te watering-place and camping ground northward from
Medina. For this purpose he set out thither in person
long with 308 men, but the leader of the caravan, the
Omayyad Abu Sofyan, got word of the plan and sent a
messenger to Mecca with a request for speedy help Con
ern about their money and goods at last drove the Koreish
o arms; a very short interval found them, 900 strong, on
he road to Bedr. By the way they received intelligence
hat the caravan had made a circuit to the west of Bedr,
nd was already in safety. Nevertheless they resolved, at
he instance of the Makhzumite Abu Jahl, for the sake of
heir honour, to continue their march When the Moslem
first got touch of them at Bedr, they took them for the
caravan; their surprise on discovering the truth may be
magined. But, kept firm by the courage of their leader,
hey resolved to face the superior numbers of the enemy.
On the morning of Friday, the 17th of Ramadan, the
encounter took place. A number of duels were fought in
the front, which were mostly decided in favour of the
Moslem. The Meccans at last gave up the fight, strik
speaking for no other cause than that they did not see
reason for carrying it on They were reluctant to shed
the blood of their kinsmen, they were awestruck in pre
sence of the gloomy determination of their adversaries
who did know what they were fighting for, and were
absolutely ready for the last consequence After a number
the noblest and oldest of the Koreish, including Abu
Jahl, had fallen, those who remained took to flight
The numbers of the dead are said to have been a great
that of the prisoners Two of the latter, whom he p
sonally hated, Mohammed caused to be put to death
Ukbah Abu Mu'ait and Nadr b. al Harith W
the latter named had previously, from the Prophet in prison
hence, the direction which he used to make use of
friend of his absence the Moslem to be entertained
treated hence termed, at Nadr's request That the Koran
taken these persons there had not been put to death
him, a Blood-feud to which the apostle replied w
I do not demand but I would gladly plead from th
for I have his maid ascend at the old tobacco
remainder prisoner he was released on payment by th
Emigrants of a heavy ransom But Mohammed is said
have afterwards regretted himself for having allow
considerations of wealth to keep him back from
ing them all to death as they deserved

The battle of Bedr not only the most celebrated
battle in the memory of Moslem it was really also
great historical importance It helped enormously
strengthen Mohammed's position The next forward
operation to be undertaken Medina was impossible, fam
which had hitherto withdrawn themselves from his
ence were so thereby fully roused by some attempts
carried out in obedience to his order, that they went

Abábísh) assembled, they set out under the command of Abú Sofyán, and without any check reached Medina, where they pitched their camp to the north-east of the city, in the green corn-field by Mount Ohod. In Medina the elders were for awaiting the attack on the town and defending themselves within it, but the young men burned the Prophet into the determination to meet the enemy without the gates, the resolution once come to he persevered in even after those who had urged him to it had changed their mind. On the morning of Saturday, the 6th of Shawwál, A.H. 3 (Jan. Feb. 625), the armies met. At first the battle seemed to be going once more in favour of the Moslems; one after another the standard-bearers and champions of the enemy fell, the whole host wavered, and even the camp was gained. But here their lust for plunder did them an evil turn. Mohammed had covered his left flank against the Meccan horsemen by a number of bowmen, whom he had ordered on no account to leave their post. But as soon as they saw that the enemy's camp was taken, they threw off all discipline, and determined to have their share of what was going. It thus became possible for the Meccan cavalry to fall upon the Moslem rear, and snatch back the victory that had already been won. In the confusion which now ensued Mohammed himself was wounded in the face, and for some time lay senseless on the ground. Among the Islám was spread the rumour, Hamza b. 'Abdalmuttalib, "the lion of God", had been cut out and carried to Abú Sofyán's wife, Hind bint 'Otba, whose father had been killed by Hamza at Bedr. But the Meccans did not know how to follow up their triumph. Instead of at once attacking Medina, where, to be sure, a second struggle with Ibn Obay, who with his following had not taken part in the battle at Ohod, would have been necessary, they contented themselves with the honours of their victory, and took the road home, after having summoned the Moslems to a repetition in the following year of the duel at Bedr. Mohammed ever put forth a short distance on the following day (as far as to Hamrá al-Asad, of course only for the sake of appearance, that the Arabs might not suppose him to have been dictated by his defeat.

Nothing came of the proposed meeting at Bedr, the Meccans failing to put in an appearance. The principal event of A.H. 4 was the expulsion of the Banú Nadír, the most distinguished and powerful Jewish family in Medina (Summer 625). Mohammed, under some pretext, had already broken with them and ordered their departure within ten days, on pain of death. Relying upon the support of Ibn Obay, they resolved to resist, and strengthened a stone within their walls; but the ally they had counted on proved a broken reed, and they were soon compelled to surrender. They were permitted to withdraw, taking along with them all their movable property except their arms. With music and roll of drum the women on camels, they marched through the street of Medina, on their way to Khaibar, where they had property. The land the Prophet appropriated to himself, but the income derived from it could be employed to meet the numerous claims that were made upon him. He seems also to have handed over some of it to the Emigrants, who stated that they had acquired no property in land in Medina.

Meanwhile, the Banú Nadír were not idle in Khaibar, but left no stone unturned to annihilate their mortal enemy. They succeeded in securing about an alliance of the Koraish and the great Bedouin tribes of Solaim and Ghatafán for the suppression of Islám. In the month Dhú 'l-ka'da, A.H. 5 (March 627), the three armies set out, 10,000 strong, under the command of Abú Sofyán. Mohammed received word of this through the Khoza'a who secretly played into his hands, and on this occasion he resolved, not as formerly to offer battle on the open field, but to make preparation for a siege. For the most part the houses of the town were built so close to one another as to make a continuous wall; at the north-west corner only was there a wide open space, through which an enemy could easily effect an entrance. Here Mohammed with the advice and direction of the Persian freedman Salmán, drew a ditch, behind which he entrenched himself with the Moslems, the hill of Sal'[1] protecting their rear. This ditch, which has become famous, and has even given its name to the entire campaign (the War of the Ditch), fully served its purpose. The enemy with their cavalry perseveringly directed their attack on this spot, but were constantly repelled by the vigilant and courageous defence of the town. They at last gave up all hope of reaching their end in this way, unless a simultaneous attack were to succeed in another quarter. To assist them in this, they endeavoured to stir up the Koraiza, the last autonomous family of Jews still remaining in Medina, having their settlement in the south-east of the town. The Nadírite Huyayy b. Akhtab, the most zealous promoter of the alliance against Mohammed, undertook charge of the negotiations, and succeeded at last in persuading their prince, Ka'b b. Asad, to break his pact of neutrality with the Moslems. But nothing came of it. The Jews doubted the perseverance of the Koraish and their allies; they had their fears lest, if the struggle proved a protracted one, the besiegers might withdraw and leave them to their fate. They accordingly demanded hostages in security against such an event, being otherwise determined not to break up all hope of reconciliation with Mohammed by entering the contest. This attitude, in turn, aroused suspicion on the part of the besiegers, whom it was not difficult to convince that the Jews were demanding hostages of them for the purpose of handing them over to Mohammed, and so making their peace with him. All this crippled their activities still more than did the failure of their own attacks upon the fosse. The season also was against them; the weather was windy, the nights extremely cold, and, worst of all, the field yielded nothing. From this cause the chief sufferers were the Bedouins, who had brought no forage for their camels and horses. Mohammed, who appears to have been kept well informed of their mood, judged it expedient to open negotiations with them. These were soon broken off indeed, but the mere fact that the Ghatafán had even entered upon them was enough to create mutual suspicion amongst the allies. One stormy night the Meccans suddenly raised the siege, after it had lasted fourteen days, and returned home; they were followed by the Ghatafán and Solaim. It was with no small joy that the Moslems on the following morning discovered the departure of the enemy; it would have been impossible for them to have held out much longer, exhausted as they were, not less by cold and hunger, than by the fatigues of constantly mounting guard. As soon as Mohammed had given them permission to leave the camp beside the hill of Sal', they dispersed with the greatest alacrity to their homes.

Mohammed, however, did not allow them much time to recruit. Hardly had they reached their abodes, when he again called them to arms against the treacherous Koraiza. The unlucky Jews had been given over to the sword by the withdrawal of the allies; a siege of fourteen days compelled them to surrender unconditionally. The me

[1] The sympathy shown by many scholars for Ibn Obay, who is weakness degenerated into fatuity, [illegible]

ere driven in chains to the house of Osáma b. Zaid, hence on the following morning Mohammed caused them to be brought one by one to the market place of Medina, nd there executed. This continued till late in the even ng. They were six or seven hundred in number, and mong them was the Nadrite Hoyay b. Akhtab the uthor of the War of the Fosse, who had left the Meccan o join his fortunes with those of the Korayza. By ccepting Islam these men could have saved their lives, ut they preferred death. No more magnificent martyrdom known to history. The women and children were old nto slavery, one young woman only, Banana, suffered the enalty of death for having broken the head of a Moslem ith a millstone during the siege. With joyous heart and miling face she went to meet her death, never forgotten y 'Aisha, with whom she was when her name was called. he Prophet selected for himself the fair Rehana, and arried her, after having caused her to become a convert o Islam.

The War of the Fosse was the last attack made by the oraish upon Medina. Mohammed now began to take the ffensive towards Mecca. The first act about with xtreme diplomacy, utilizing the festival, and the truce of od subsisting at the time of the festival, for the purpose f paying a visit to his native town. Although a novice l in winning to his side the neighbouring troops of edouins, it was nevertheless with a considerable following 1500 men) that in Dhú l-Ka'da VI. (March 628) he set ut on his journey. In a dream he had had the Key of he Ka'ba delivered to him, on the strength of this fe ollowers believed firmly in the success of the expedition. ut the Koraish were determined that the pretext of pil rimage should not avail their adversary. They summoned heir allies and formed a camp to the north of their town or the purpose of preventing the entrance of the Moslems. Mohammed was forced to halt at Hodeibiya on the border f the sacred territory, and it was not even that by fair peeches he sought to obtain permission to make the ircuit of the Ka'ba. He felt himself too weak to force is way, and accordingly preferred to treat. While the nvoys were passing to and fro, there suddenly arose an larm in the Moslem camp, they apprehended a sudden ct of treachery on the part of the Meccans. It was on his occasion that the famous Homage under the Tree took lace, when Mohammed pledged his followers by striking ands that they would stand by him and go to death for is sake. Some of the Koraish agents witnessed the scene, nd were immensely impressed by it, such an enthusiastic bedience as Mohammed received, such an ascendency over he minds of men as he exercised, they had never before onceived to be possible, and on their return they urged heir people in the strongest way not to permit matters to ome to extremities. The Koraish accordingly judged it est to offer a bargain with Mohammed, the terms being hat for this year he was to withdraw, so that the Arabs ight not say that he had forced an entrance, but that on he following year he was to return and be permitted to emain three days within the sacred territory for the urpose of sacrifice. After some discussion Mohammed ccepted this proposal, although zealous Moslems detected discreditable shortcoming in matters of faith, in so far as t involved turning back within sight of the Ka'ba without eing allowed to accomplish the sacred circuit. When the greement was to be committed to writing, Mohammed ictated the words: "In the name of Allah, the merciful Rahmán";[2] but the Meccan plenipotentiary, Sohail b Amr, declared that he knew nothing about Rahman, and insisted upon the customary formula "In thy name, Allá homma!" The Moslems murmured, but Mohammed yielded. He then went on to dictate: "This is the treaty f peace between the apostle of God" . . . Sohail anew protested; to acknowledge Mohammed as the apostle of God, would be to declare himself his follower; the de putation ought to be simply Mohammed b. 'Abdallah. The Moslems murmured louder than before, and refused to consent to the change. The head of the two tribes of Medina, Ousid b. Hodair and Sa'd b. 'Obáda, held the hand of the scribe and declared that "Mohammed the apostle of God" must be written, or the word must de cede. The Meccan representative whispered to one another words of amazement at the spirit displayed by these men. But Mohammed made a sign to the zealots to hold their peace, and again gave way (cp. xxvii. 110). The writing which now took shape ran as follows:

"In the name O God! This is the treaty of peace concluded by Mohammed b. Abdallah and Sohail b. Amr. They have agreed to allow them arms for ten years. During this time each party shall be safe and their hands shall be withheld from doing damage to the other; no secret damage shall be inflicted, but pure faith and honour prevail between us. Whosoever wishes to enter into a treaty and covenant with Mohammed can do so, and whosoever wishes to enter into treaty and covenant with the Koraish can do so. But if a Koraish come without permission to Mohammed, he shall be delivered up; but, on the other hand, one of Mohammed's people coming to the Koraish he shall not be delivered up. This year Mohammed with his men must withdraw from us, but he must be now one month in Yathrib and remain for three days with us without other weapons than those of a traveller, the sword remaining in their sheaths."

The first result of the treaty was that the Khoza'a declared for alliance with Mohammed, while, on the other hand, the Bekr b. Kinana joined themselves to the Koraish.

To compensate his followers for the apparent fruitlessness of the expedition, Mohammed immediately after their return led them out against the rich Jewish oasis of Khaiba (northward from Medina), whither the Banú Nadir had migrated, and from which place they had unceasingly stirred up opposition against the Prophet. Hitherto he had contented himself with putting out of the way by means of assassination, one of their leading men who seemed to him to be particularly dangerous, such as Abú Rafi' and Yosair b. Razim,[3] but now he resorted to wholesale measures. In Moharram VII. (May 628), he made his appearance before Khaiber with a powerful army, in the plunder only those who had taken part in the expedition of Hodaibiya were to have, but many other beside accompanied them. The Jews, although aware of the hostility of Mohammed's intentions, were nevertheless taken completely by surprise; when one morning they saw him and his troops encamped before their stronghold. One of their leaders had given them the excellent advice not to shut themselves up by famine in their quarters, but to construct a common camp in the field, otherwise they were likely to have the fate of their co-religionists in Medina. But they replied that their stronghold were of a different sort, perched on impregnable summits, and they remained shut up within them. They had neither discipline nor order, courage nor devotion. As they were wanting in community of feeling, so also were they lacking in leader. Their head man, Salam b. Mishkam, lay on a sick bed, his place was by no means supplied by Kinána b. Abi l-Hokaik. When they suddenly became aware that they had been completely abandoned by their Arab allies, the Ghatafan, their heart utterly failed them. When besieged in any of their citadels, they hardly ever waited

o be stormed, but after one or two sorties evacuated it nd withdrew to another, where the same story was re peated. Three citadel after citadel fell into the hands of he Moslems, each of which had something to do with he name or with well-nigh superhuman. From Al-Natat he town withdrew to Al Shikk, and at last nothing was eft to [illegible] Al Kathiba (with Al Watih and Sulalim)[1]. There [illegible] manned shut up and tilled with fear without [illegible] formerly, made [illegible] bats and [illegible] ector the citadel. After one time they asked for [illegible] obtained it on the footing that they returned [illegible] wives and children, and one garment each but [illegible] up all their property, the penalty of concealment [illegible] being death. Kinana b. Abu'l Hakik was cruelly put to death after he had buried the removed jewels of his family; thus at the same time [illegible] hand one with Safiya but Hoyay was left free for Mohammed.

He married with the daughter of the Imam' was and [illegible] the proposed marriage. Safiya felt no repulsion towards the man who had caused the death of her father Hoyay and of her husband Kinana. She readily accommodated herself to the situation. Mere worthy was the honeymoon of another Jewess, Zeynab, who made the attempt to poison the executioner of her people and atoned for the violence by her death. The attempt was unsuccessful, but Mohammed believed that even in his last illness he could trace the effects of the poison.

Simultaneously with Khaibar [illegible] Jews to hus band and cattle, vineyard and Wadi Kura, where also there were [illegible] Jews. The plunder was very considerable [illegible] and [illegible] moveable. It was gathered together [illegible] the booty, the proceeds were to [illegible] Mohammed ordered very strictly that no one should be permitted to plunder for himself. The [illegible] Muhajirun [illegible] Ansar [illegible] Most valuable [illegible] were [illegible] and [illegible] time came to remain at a distance in the [illegible] of the Jews. Half of the produce had to be paid [illegible] The [illegible] of the pool fell to the [illegible] of the Prophet, a fifth of the movable [illegible] and [illegible] portion. He consequently had [illegible] and [illegible] material to [illegible] them, not only for the enrichment of his [illegible] but also for [illegible] over to his able [illegible] which were more accessible to payment than to preaching.

The peace of Hodaibiya, with the [illegible] of Khaibar, close the first period of Mohammed's life at Medina. Hitherto, it merely contained the latent elements of the War of the Ditch and [illegible] Henceforth Mohammed's [illegible] became apparent, and [illegible] the advantages [illegible] with him. "No victory of Islam," Muir was wont to say, "has more importance than the [illegible] of Hodaibiya, for more are always [illegible] ning them [illegible] and [illegible] there first [illegible] a wall of partition between the Moslems and [illegible] more they never spoke to each other, when [illegible] they began to fight. Subsequently both [illegible] and mutual confidence took [illegible] man of even moderate intelligence who heard [illegible] pointed it, in the twenty-two months during which [illegible] the number of converts [illegible] throughout the whole of the previous period; the [illegible] in all directions among the Arabs.

As a religion Islam did not attract the Arabs; they had no inclination to pray, read the Koran, and give alms. Of this they had given sufficient evidence by their perennial feuds with Mohammed, and by the murder of divers of his missionaries who were sent to teach them the faith.' We can hardly believe that a new spirit now suddenly possessed them. Their change of attitude was merely due to the impressing effect of the rising might of Islam. They began to respect the Moslems, who, in spite of their small number, could defy a whole world, because they were of one mind, and did not ask what the world thought. They saw that, in the great conflict between Mecca and Medina, in which as actors or as spectators they had all participated, the victory inclined more and more to the side of Medina, that force could accomplish nothing against faith. The prestige of Mecca was shaken by the War of the Ditch, and was not restored by the treaty of Hodaibiya, in which the Koraish waived Mohammed's with the open hand, and at the same time permitted him to return next year. Islam had stretched out its neck had consolidated itself into indestructible existence, at now fought for victory. There was, moreover, another argument in favour of the new religion, to which the Arabs were very sensible, the rich booty, to wit, which the Moslems acquired by their continual forays. There is no question that the material success of Islam was the chief force that attracted new adherents.

The treaty of Hodaibiya gave a breathing space to the two combatants, and of this the prophet reaped the whole advantage. The truce, which lasted for almost two years, brought to the Meccans an almost unbroken series of humiliations and losses. Contrary to all expectation, the provision made in their favour by which Mohammed bound himself to send back each of them coming as a deserter to him became their majority, turned to their hurt, so that they had to ask Mohammed to have it changed. Still more serious for them was the desertion of three eminent men, Khalid b. al Walid, 'Amr b. al 'As, and 'Othmán b. Talha, whom the Prophet received with open arms. Never were they looked on with shame and concealed indignation when the Prophet, availing himself of his stipulated right, entered the city with 2000 men and performed the sacred ceremonies (Omrat al Kada, March 629). Still they were afraid to break with him again, and did not even venture to [illegible] the murder of Ibn Sunaina, the Khoza'a, who lived in the neighbourhood. "When they put one foot forward they draw the other back, they are convinced that Mohammed will win." So much was the impression the Koraish made on the Bedouin, who have a very keen instinct in matters of the sort. They had lost confidence in themselves; they knew that the fight was not fought out, but they dared not venture to bring it to a decision.

Against them will the decision came. The Banú Bekr fell upon Mohammed's friends, the Khoza'a, and were supported by some of their Koraish-shite allies. The Kho-

[1] Such were the names of the three separate quarters of Khaibar, each one made up of a complex of houses and citadels.

[illegible] p. 153-155; (Ibn Ma'una and al Bajl'), and the genuineness of the letter, see p. 230 *sqq.*

Abu Basir fled to Mohammed to Medina; the Meccans demanded his surrender. He was given up, in spite of his passionate appeals, to the two messengers sent to fetch him. But on the way one of them and slew him with his own sword; the other fled back to Medina in horror. Abú Basir followed him. Mohammed had now done enough to satisfy the Meccans; however, when the messenger refused the charge of so dangerous a person, and Mohammed permit the latter to go off where he pleased, [illegible] him to [illegible] with the Moslems. Accordingly Abu Basir took up his position on the coast road of the Syrian caravans, and became the leader of other Moslem fugitives from Mecca, who quickly gathered round him. They intercepted all caravans, divided the prey, and slew the men. Abu Basir's robberies at length induced the Meccans to ask Mohammed by letter to allow him to join his community, and put an end to the mischief.—*Tabari*, p. 261; Ibn Hishám

tes complained to the Prophet, who eagerly seized the retext for war. In vain did the Meccans send Abu Sofyán to Medina to renew the truce; they could not move the Prophet from his purpose. In Ramadan, A.H. 8 January 630), he moved against Mecca with an army of 0,000 men. With the Emigrants and the Defenders were mustered the Aslam, Ghifar, Mozaina, Johaina, and Ashja'; the Solaim and the Khozá'a joined them on the way. The Bedouins were drawn by the hope of booty he Fazárite 'Oyaina was sorely vexed that he had left h Ghatafan at home, not knowing what was in store for Mohammed at first kept the aim of his expedition secret Some of the Meccan nobles must however have known it; Makhrama b. Naufal, for example and the Prophet uncle, 'Abbás, did not await the capture of the city, but deserted to the enemy while he was still distant Abu Sofyan, in particular, must have been in the secret it appears that at Medina he received the promise that the holy city should be spared if it yielded peaceably and that he pledged himself to do his best to place it in the hands of the Prophet.[1] But before the people were necessary to keep up the appearance of a struggle an inevitable submission to the unforeseen dictates of The same comedy was repeated afterwards at Mecca he heathen treated with the Prophet without consulting the Thakafites, and then contrived that the result of their policy should appear to be forced by the events of war. The Moslems were on the border of the holy land before the Meccans suspected their approach. Their cavalry eight 10,000 lines were drawn up to intercept to the north west of the holy city. Its wells destroyed, Mecca fastened to the hostile camp. He returned with the news that the Moslems were at the that any resistance could effect nothing; nearly three wise counselled surrender. Mohammed had promised security to those who remained in their houses or threw away their weapons. The terrified Meccans had hardly any other course open to them than to follow this advice. And now the Moslems entered the city from several sides at once, meeting only at one point with an easily quelled resistance. Mohammed insisted that there should be no violence; he pledged the captains to avoid all bloodshed. Ten persons only were put to the ban, not of the whole half were subsequently pardoned. He took all pains to preserve the sanctity of Mecca unimpaired, confirmed the rights and privileges therewith connected, and made it plain that the old cultus should not be [illegible] under Islam. The ceremonies were retained, save only that he abolished all idols, both the domestic wood found in every house and the images in and round the Ka'ba. But every sanctuary outside of Mecca was destroyed, except such as had a part in the celebration of the Feast, and so stood in connexion with the Ka'ba itself. That the Meccan worship gained a new and unique importance Mohammed's reform did for Mecca what Josiah did for Jerusalem.[2]

The last step towards that identification of the Ka'ba with Islam, which made it the religious centre of the Moslem world, was not taken till the following year, when the famous Renunciation (Barâ'a) of Sura ix forbade the heathen to share in the Feast, which was henceforth to be strictly Moslem ordinance, and at the same time abrogated the peace of the holy months. A year later (Dhu l Hijja, A.H. 10, March 632) he himself celebrated the Feast for the first time in the orthodox fashion, introducing certain modifications on the traditional practice and

[1] The tradition indeed is silent, but Muir (iv. 120) is justified in drawing this inference from the course of events.

[2] Snouck Hurgronje, *Het Mekkaansche Feest*, Leyden, 1880

reducing certain varieties of use to uniform rule. In this he professed to re-establish the true ancient u purged of heretical deviations from the example Abraham. At the same time he remodelled the Calend forbidding the occasional interpolation of a month as arbitrary and human invention, and establishing the l lunar year of twelve lunations.

We return to the capture of Mecca. The submis[illegible]ion the Koreish was followed by that of their nomad brethr and allies. But the neighbouring Hawazin, to whe belonged also the Thakafite inhabitants of Taif, assembl for battle with the Moslems. They encamped in Aut between Taif and Mecca. Mohammed advanced against them, and battle was joined in the valley of Honain. T Moslems were broken by the first flights of the foe fou[illegible] round the Prophet himself was in danger till the Khazr rallied round him, checked the onset of the Hawazin, an at length turned them to flight. A vast booty rewarde the victors, for the Hawazin had brought all their hou and non-combatants with them and placed them in th rear that they might feel what they were fighting for Mohammed caused the prey to be conveyed to the [illegible] Ji'rana out of the northern border of the Haram a litt way off the great valley that descends from Taif, he hi next proceeded on to Taif itself. Here however he found his objects made of more stubborn stuff; a month's siege bowl of cream that was set before him, either the co tent ran out. Mohammed therefore broke up the siege and marched to Ji'rana to deal with the booty. He h decreed this step in the hope that the Hawazin would [illegible] tempted to embrace Islam in order to recover the females and cattle. But as they still [illegible] and [illegible] had to yield to the pressure of the situation and [illegible] pool. When at last too late the [illegible] appeared to take over their convoy from the [illegible] now to give up their lead and contest them the [illegible] their wives and children were restored to the[illegible] through the mediation of the Prophet with the [illegible] ation. The leaders too read contempt of [illegible] for wh they gave up the Divine Word and [illegible] captives booty. Although [illegible] went in the distribution of booty more than had been the share of the convert those who [illegible] to the [illegible] noble of Mecca who had not been in the battle, but [illegible] Mohammed decreed to consist to be [illegible] camels.

The fall of Mecca exercised powerfully on the futu development of Islam. Year the [illegible] came the [illegible] of the Moslem over t Koreish shaped itself into a demonstration of the Koran over the Moslems. For this the Prophet himself was blame. In making Mecca the holy city of Islam, he w ostensibly moved by religious motives, but in reali Mohammed seldom had nothing to do with t heathenish usages at the Ka'ba and the Great Feast. represent Abraham as the founder of the ritual was mere a pious fraud. What Mohammed actually ought was recommend Islam to Arabic prejudices by incorporatin the fragments of heathen use and at the same time be w influenced by his local patriotism. Henceforth the local feeling became quite the main point of his conduc his attitude to the Koreish was determined entirely b the spirit of clear-sighted [illegible]. Hence the extraordinary val he set on the conciliation of their chief, and [illegible] impression that he cared more for the [illegible] for the co version of all the rest of the world. He beat them that they already had; he gave them in addition whatev they asked, if only they would be his good friends. Abu Sofyán was a great man already, but Mohammed has[illegible]

[1] Among them were relatives of the Prophet's foster-mother, Halima

to raise his power by giving him rule over a broad tract southward from Mecca. He used every means to make their conversion easy to the Koraish, and to convince them that they were losing little and gaining much. They had the sense to realize this and act accordingly; they were soon the best of Moslems, and that for the best practical reasons.

The men of Medina, as was natural, felt themselves to be in a special degree by the plotting of the Koraish. All they had done all and sacrificed all for the Prophet were theirs now to reap the fruit of their labours.[1] Had they by years of struggle made Mohammed Lord of Mecca, only that they might surrender in favour of Mecca the place they had hitherto held? Did he indeed seem to know so much more than mere service to the Faith? The Defenders had good ground for discontent, but Mohammed appeased them easily enough. He reminded them of their fellowship together in the great days of the past, of all that he had done for them and they for him, he promised that their town should still be his residence, and so the political capital of Islam (Madinat al-Islam). Then all the men wept till their beards were wet and said "O apostle of God, we are content with our share and lot."

The Defenders murmured at the preference shown to the Koraish, because they deemed preference for themselves. But already there were movements of an opposition from principle which deemed it a falling away from Islam to give any heed to kinship instead of to faith. It is related that the beginnings of the Khárijite (Dissenters) go back to the distribution of booty in Wádí'l-Jiránah. Certain it is that a worldly bias, which had indeed been introduced into Islam long before, then first became visible to every eye. Certain it is that Mohammed then sowed the seed of the deep dissensions that rent his followers after his death, of the struggle between religious democracy, such as Islam demanded, and the national aristocracy, which alone was really fit to hold rule in Arabia. It was Mohammed who placed the helm in the hands of the Koraish and opened the way to sovereignty for Abú Sofyán and his house, the Omayyads. If the Khárijite Dhú'l Khowaiṣira protested against the Prophet himself at Jiránah, the feeling that moved him was quite sound.

The last years of the Prophet were like the ingathering of a harvest laboriously reaped. The conquest of Mecca, so great was the impression it produced, was called "the conquest," as if it contained in it all other. From every side, in the next two years, the sheikhs streamed to Medina to open negotiations for the acceptance of Islam by their tribes; if they did not come spontaneously Mohammed sent to them. A change of heart on the part of the Arabs had no more share in these than in former conversions. It cost them no struggle to cast away their idols, the mirror and the sanctuaries fell quietly enough. Heathenism was a dead thing; superstitions could be transplanted into Islam. The unique sovereignty of Allah was clearly evidenced in the fact that no might could withstand him. It is safe to affirm that the accessions to Islam were due to political more than religious impulses, and meant adherence to the state of Medina rather than to new doctrines. The power to which that unity had grown acted as a force of attraction upon the Arab; and their submission was not the mere effect of fear, but expressed also that sense of the necessity for peace and order, which had led to the foundation of states in the two previous centuries. Thus it becomes intelligible that from every side by a sort of natural necessity, the masses of Arabian society were drawn towards the centre of attraction at Medina, and that the Prophet received the homage of distant tribes which he could not have influenced directly. The Christian tribes were not behind the rest, they were Arabs first and Christians after. Only the Christians of Najrán remained true to their faith; so did the Jews in all parts, and the Magians in the province of Bahrain.[2] The last named, as idolaters, ought not in strictness to have been tolerated in a Moslem state, but practical considerations broke through theory, and the men of system had to accept the inconsistency with the best grace they could.

The articles of submission were (1) the performance of the five daily prayers, or at least the proclamation of the times of prayer by the Muedhdhin; (2) the payment of the alms tax; (3) the acceptance of the Moslem Law, which was introduced by qualified delegates from Medina. Otherwise things remained as they were; Mohammed was careful not to meddle with tribal affairs, and strengthened the existing aristocracy wherever he could do so. The change of faith was effected by treaty; the populace was not consulted and the whole negotiations were directed by the Elders and Chiefs. For, in fact, purely political interests were involved.

A single case, about which our information is exceptionally full, will suffice in illustration. The Hawázin joined Mohammed after the battle of Honain, and had preached the duty of holy warfare against their kinsmen the Thakafites of Taif, who were still heathens. They made raids on the cattle pastured without the city, and made captives of those who ventured abroad. The Thakafites were exposed, alone and helpless, to the advances of Islam; they dared not stir a foot beyond their walls. The heads of the city found the situation untenable, and resolved to do homage to the Prophet for the sake of peace. Ten ambassadors proceeded to Medina, and negotiation began as to the conditions of the conversion of Thakif. The envoys desired that fornication, usury, and wine drinking should be permitted to them; this Mohammed refused (Qur. xxii. 231; ii. 278; v. 92); and they consented to yield the point when it was explained that indispensable as these three practices might seem, the other Moslems had learned to give them up. There was more difficulty about the Rabba or Goddess of Taif (Lat). The ambassadors begged that, as a concession to the foolish multitude, they might retain her for three years. When they found Mohammed resolute, they came down successively to two years, one year, and a month. Even this was refused, Mohammed's sole concession was that they should not be obliged to destroy their goddess with their own hands. The deputation returned, and had nearly reached Taif, when 'Abdyalil counselled the others to make as if they had broken off the negotiation, and not to discuss the conclusion of the pact till the Thakif showed their stomach for battle with Mohammed. With faces covered, like men who have no good news, they rode into the town and first paid the customary visit to the temple of the Rabba. Then they told their tribesmen the conditions of the treaty, declared them intolerable, and reviled Mohammed as a hard and arrogant man. "And so," they concluded, "prepare for war, lay in provisions for two years. Mohammed will surely not maintain the siege longer than to see to protect your stronghold, and lose no time." The Thakafites at first agreed to this; but in a few days they lost courage, and bade the negotiators return and accept the conditions. These then confessed the truth

[1] *Wakidi*, p. 377. Ibn Hisham, p. 881.

[2] Non-Moslem subjects were made to pay an arbitrary capitation or income tax.

[3] The expenditure of this tax was regulated in the case of certain tribes by special treaty.

nd added that Mohammed's emissaries would presently ppear to destroy the Rabba. The destruction took place ecordingly, to the terror of the women and children, but ithout a single man raising his hand

The pilgrimage undertaken by Mohammed in the year 0 (March 632) was like a very triumph. All Arabia, part from the vassals of Persia and Greece, lay at his feet. The greatest success of his life had been effected by sheer oral force without a stroke of the sword. But Arabia o longer sufficed him; he had wider aims. In his last ears he began to extend the holy war against the Greek Even on his return from Hodaibiya, he began to direct nvoys to several foreign potentates, with letters demand ng their adhesion to Islam. One of the envoys was eized and beheaded in the Belka (the ancient Moab). Hence sprang the first campaign against the Greeks, or he Arabs who were subject to the Greek empire. The rmy directed against them was, however, entirely defeated t Mu'ta (Autumn 629), Khalid succeeded with difficulty n rallying and leading back the broken remnant of the ost. Next summer the Nabatæans who visited the mar et of Medina spread a rumour that the Emperor Heraclius was collecting a vast force to attack the Moslems, and Mohammed set forth to meet him at the head of 30,000 men, but got no farther than Tebuk, on the southern borders of ancient Edom, when the rumours were found to be false. The expedition, however, was not altogether fruitless, as it led to the submission of several small Jewish and Christian communities in the north of the Peninsula. Mohammed equipped a new expedition against the Greeks on his return from his "farewell pilgrimage," and it was just ready to start when he died, on Monday 8th June 632.

In forming an estimate of one who has exercised so unexampled an influence on the history of the world, we shall do well to bear in mind the hint of Gibbon, that "some reverence is surely due to the name of heroes and the religion of nations." The grounds on which Mohammed may be condemned are partly found in his private life. Although on the whole, even after he had become ruler of all Arabia, he maintained the original poverty and simplicity of his establishment, never setting store by money and estate, eating and drinking and soft clothing, strictly continued to fast and watch and pray after his first call to them, and that, too, plainly out of a heartfelt need and without any ostentation, he nevertheless in one point at least claimed for himself supreme authority as prophet to make provision for the flesh. He claimed to be personally exempt from those restrictions in regard to the female sex which lay upon all other Moslems, and, as is well known, he made very extensive application of this fundamental principle. This fact is quite rightly urged against him as a reproach; even pious Moslems have been scandalised by it. At the same time it is unnecessary to judge him on this account more harshly than we do Charlemagne, the most Christian king of the Franks, in any case we must not apply the standards of the present day to the circumstances of old Arabia. Of much weightier and indeed of crushing character is the accusation, that he did not really believe himself to be a prophet, but merely of set purpose played the part of one. For the first years of his activity indeed this charge is not now any longer maintained; it is universally granted that at that period his enthusiasm was genuine and real. But in Medina, we are told, he used his prophetic character simply as a pretext for the establishment of his power. It seems to the present writer that into this opinion there enter modern notions as to the separation between religion and the civil magistracy, which ought to be carefully kept out of sight. By any other instrumentality than that of a prophet it would hardly have been possible to found the state of Medina: religion was the soul of the community. The founding of a religion and the forming of a state were not connected in so merely external a way as is usually supposed, on the contrary, the one was the natural and necessary consequence of the other. This must certainly be conceded, that, if we are to make any distinctions at all, Islam was far less rich in religious meanings than in social forces. The Koran is Mohammed's weakest performance, the weight of his historical importance lies in his work at Medina and not in that at Mecca. And it is a fact that the politician in him outgrew the prophet more and more, and that in many cases where he assumed spiritual motives he merely did so to give a fair appearance to acts that emanated from secular need. In this respect it appears to us particularly objectionable that he gave out as revelations of God and placed in the Koran all sorts of regulations and orders of the day, which proceeded simply from his own deliberations or even in part were suggested to him by advisers from outside. At the same time the element of self-deception is not excluded even here. He took for a message sent down from heaven everything which in his cataleptic fits passed through his mind, however clear enough he at agreement with his own previously clear best thought. It was pardonable that he went on with the idea after he had once grasped it, that he blew upon the coal when the flame threatened to die out. It is easy to free him from the reproach of perfidy and cruel vindictiveness. The surprise of Nakhla in the month Rajab (ordered by him, though he afterwards repudiated it), the treatment of a nation which he maltreated, the execution of the 600 Jews at the close of the War of the Ditch, border, the Prophet heavily and inherently explain the wide-spread antipathy in which he is held. Yet even in this respect it is well not to forget the motives, already cited of Chrysostom, He pressed the man of vast aims who find it most difficult to keep the beaten path.

After the death of Mohammed arose the question who was to be his "representative" (Khalifa, Caliph). The choice lay with the community of Medina, as this was understood; but whom were they to choose? The natives of Medina believed themselves to be now one more matter in their own hands, and wished to promote one of themselves. But the Emigrants asserted their superior claims, and with success, having brought into the town a considerable number of outside Moslems, enough to overawe the men of Medina, who besides were still divided into two parties. The Emigrants' leading spirit was Omar; he did not however, come himself to be proposed to himself but to Abubekr, the friend and father-in-law of the Prophet.

The affair would not have come off so smoothly, had not the opportune decease of the Arabian pretenders put a stop to the onward schism which threatened. Islam suddenly found itself once more knitted to the community of Medina only Mecca and Taif remained true. The Bedouins were willing enough to place Medina, but less willing to pay taxes to their detention, as might have been expected was a political movement. Nowhere was it a revolt from Islam, for here religion, political society and the religious are identical. A peculiar consideration to Mohammed was involved in the fact that the leaders of the rebellion in the various districts did not pose as princes and kings, but as prophets, as the secret of Islam's success appeared to be.

Abubekr proved himself quite equal to the perilous situation. In the first place, he allowed the expedition against the Greeks, already arranged by Mohammed, quietly to set out, limiting himself for the time to the defence of Medina. On the return of the army he proceeded

[1] Compare Muir, iv. 263.

[2] See Nöldeke, *Beiträge zur Kenntniss der Poesie der alten Araber* (1864), i. 89 *sq.*

ttack the rebels. The holy spirit of Islam kept the men
f Medina together, and inflamed them to a death-defying
eal for the latter while, on the other side, the Arabs as a
hole had no other bond of union and no better source of
nspiration than a confused paganism. As was to be expected,
hey were worsted in seven small flying columns of the
Moslems, sent out in various directions, failed to quell
he revolt. Those who submitted were forthwith received
nd pardoned; those who persisted in rebellion were
ompletely crushed. The majority, accordingly converted,
he apostates were extirpated. In Yamama only was
here a stand to struggle. The Banu Hanifa under their
hief Moseilama fought bravely, but here also Islam

[illegible] Islam in Arabia was
[illegible] to say, brought about by the distribution already
he holy war against the heathen country which Mohammed
ad already organized was the best means for maintaining
he new religion popular among the Arabs, for maintaining
ce by means of the sword the worship of Allah, opposi-
nity was at the same time attended by increasing
ooty. The next movement was of course Islam, but
o many were induced to join it by more other than
heroic motives. Now was the Islamic principle the most
ecessary one which the Arabian chiefs had overlooked
ince and according to former times every attempt to
Sodomize had settled on the borders of the wilderness.
The best test may perhaps be seen in the case of the ever
much desired possession of the old Satrapan kingdom
Mesopotamia, the most Arabian kingdom of
the ancient Hierarchical organization, the western and eastern
borderland of [illegible] the more prized to Moslem
conquest as [illegible] coveted goal, not only on account
thereof was subject to [illegible] and Persian Pahlawi time to
the Greek, the [illegible] of the Arabian accepted the
xtension of the war to exceed the limits of Arabia to a
struggle with the two great powers.

After the pacification of Middle and North Eastern
Arabia, Khalid by Abubekr's order or the
Caliph to the conquest of the Euphrates on the lower
Euphrates. The more he was instructed to [illegible] where
o-ordinate but distinct from [illegible] the
summer of 633, as from 20th August 633 to the
attle on the Hieromax (Yarmuk) was fought, the
he Emperor Heraclius hurriedly [illegible]
hemselves, the Christian hemisphere would decidedly have
ken only an isolated case in the history of the

these limits annexation was practicable and natural, a
repetition indeed of what had often previously occurred.
The kingdoms of Ghassán and Hira, advanced posts
hitherto, now became the headquarters of the Arabs; the
new empire had its centres on the one hand at Damascus,
on the other hand at Cufa and Basra the two newly
founded cities in the region of old Babylonia. The
capital of Islam continued indeed for a while to be Medina,
but soon the Hijaz and the whole of Arabia proper lay
quite on the out[illegible]ert of affairs.

It is striking to notice how easily the native population
of the conquered district exclusively or prevailingly
Christian, adapted themselves to the new rule. Their
nationality had been broken long ago; but intrinsically
it was more closely allied to the Arabian than to the
Greek or Persian. Their religious sympathy with the
West was certainly impaired by dogmatic controversies;
from Islam they might at any rate hope for toleration
even though their views were not in accordance with the
theology of the Emperor of the day. The lapse of the
masses from Christendom to Islam, however, which took
place during the first century after the conquest, is only to
be accounted for by the fact that in reality they had no
inward relation to the gospel at all. They changed their
creed in order to acquire the rights and privileges of
Moslem citizens. In no case were they compelled to do
so, on the contrary, the Omayyad Caliphs saw with dis-
pleasure the determining process of the poll tax derived
from their Christian subjects.

It would have been a great advantage for the solidity
of the Arabian empire if it had confined itself within the
limits of the old Semitic land with perhaps the addition
of Egypt. But the Persians were not so ready as the
Greeks to give up the contest, they did not rest until the
Moslems had subjugated the whole of the Sasanid empire.
The most important event in the protracted war which led
to the conquest of Iran, was the battle of Nehawend in
641, the most obstinate resistance was offered by Persis
proper, and especially by the capital, Istakhr (Persepolis).
In the end all the provinces and somewhat autonomous
provinces of the Sasanid empire fell, one after the other,
into the hands of the Moslems, and the young Shahanshah

to ruin, where he came to a miserable end.[1] But in more
than one case the work of conquest had to be done over
again, as we have to see the Iranians learned to accept the
position. Unlike the Christians of Western Asia, the
had a vivacious feeling of national pride, based upon
historic memories and especially upon a church having
connection of the closest kind with the state. Internal
disturbances of a religious and political character and
external disasters had long ago shattered the empire of
the Sasanid indeed, but the Iranians had not yet lost
their patriotism. They were fighting, in fact, against the
despised and hated Arabs, in defence of their holiest pos-
sessions, their nationality, and their faith. They were
subjugated, but their subjection was only outward. The
commonwealth of Islam never succeeded in assimilating
them as the Syrian Christians were assimilated. Even
when in process of time they did accept the religion of
the Prophet they leavened it thoroughly with their own
peculiar leaven, and, especially, deprived it of the practical
political and national character which it had assumed after
the Flight to Medina. To the Arabian state they were
always a thorn in the flesh, it was they who helped most
largely to break up its internal order, and it was from
them also that it at last received its outward deathblow.

[1] De Goeje, *Mémoire sur la Conquête de la Syrie*, 2nd ed., No. 3, Leyden, 1864; Noldeke, *Z. D. M. G.*, 1875, p. [illegible]; Baladhori, 137.

[2] See H. Zotenberg in *Journal Asiatique*, 1874, [illegible]. The date is perhaps some year too late.

[1] The accounts differ, see Baladhori, 305. The chronology of the conquests, as is well known, is in many points uncertain.

[1] Baladh., 315 *sq.*, Tabari, i. 1068.

The fall of the Omayyads was their work, and with the Omayyads fell the Arabian empire. The course of Islam's political history during its first centuries is denoted by the removal of the capital from Damascus to Cufa, and from Cufa to Baghdad, the latter occupying, approximately, the site of the ancient Ctesiphon.

But we must return to the period of Abubekr. He died after a short reign, on 23d August 634, and as a matter of course was succeeded by 'Omar. To 'Omar's ten years' Caliphate belongs for the most part the great conquests. He himself did not take the field, but remained in Medina; he never, however, suffered the reins to slip from his powerful hand. The influence of his personality and the Moslem community of feeling. His political genius is shown by the circumstance that he endeavoured to limit the indefinite extension of Moslem conquest, and to maintain and strengthen the national Arabian character of the commonwealth of Islam; also by his making it his foremost task to promote law and order in its internal affairs. The saying with which he began his reign will never grow antiquated. "By God, he that would be over you must be in my sight the strongest, until I have wrested from him his rights, but him that is strong I will have as the weakest, until he complies with the law." It would be impossible to give a better general definition of the function of the State. After the administrative apparatus he directed his organizing activity, as the circumstances demanded, chiefly towards matters relating to the regulation of taxation in the conquered territories and the application of the vast resources which poured in to the treasury at Medina. It must not be brought forward as a personal reproach, that in dealing with the Arabs he followed the principle that the Moslems were the born rulers and leaders of all the rest of the world. But he lost his life by his death for the fault of having overlooked a Persian slave, driven to desperation by abuse and threats, who stabbed him in the mosque at Medina. He died in the beginning of November 644.

Before his death 'Omar had nominated six of the leading Emigrants who should choose the Caliph from among themselves: 'Othman, 'Ali, Zobair, Talha, Sa'd b. Abi Wakkas, and 'Abd al Rahman b. 'Auf. The last named declined to be a candidate, and decided the election in favour of 'Othman b. Affan. Under this weak overlord the government of Islam fell entirely into the hands of the Koraish nobility. We have already seen that Mohammed himself prepared the way for this transference; Abubekr and 'Omar followed suit; the Emigrants were unanimous among themselves in thinking that the precedence and leadership belonged to them as of right. Thanks to the energy of Omar, they were successful in appropriating to themselves the succession to the Prophet. They indeed rested the claim they put forward on the undeniable priority of their services to the faith, but they also appealed to their blood relationship with the Prophet, as a legitimation of their right to the inheritance; and the ties of blood connected them with the Koraish in general. In point of fact they felt a greater solidarity with these than, for example, with the natives of Medina; nature had not been expelled by faith.[3] The supremacy of the Emigrants naturally furnished the means of transition to the supremacy of the Meccan aristocracy. 'Othman did all in his power to press forward this development of affairs. He belonged to the foremost family of Mecca, the Omayyads, and as he should favour his relations and the Koraish [illegible] in every possible way, seemed to him a matter of course. Every position of influence and emolument was [illegible] to these, they themselves heartily called the imperial province of Irak the garden of Koraish. In truth, the entire empire [illegible] Nor was it unreasonable that from the [illegible] of Islam the best advantages should be reaped by those who had it the world. So it were beyond all doubt the patricians of Mecca and after them those of Taif; people like Khalid al Walid, 'Amr b. al 'As, 'Abdallah b. Sa'd, Sa'id b. Al 'As, Marwan b. Al Hakam, and, above all, Abu Sufyan with his son Mo'awiya the governor of Syria.

Against the ruinous tide of worldliness an opposition arose, however, now here now there, to appear. It was led by what may be called the ascetical nobility of Islam, which distinguished from the hereditary nobility of Mecca, may also be designated as the nobility of merit, and which [illegible] the "Defenders" and the pervades of the Koran, and who bear themselves to the [illegible] of the Koraish but by means with the intention of allowing merit [illegible] thereby enhanced. The opposition was headed by Zobair, Talha, both [illegible] and [illegible] and a disappointed candidate [illegible] their tendency was [illegible] purely [illegible] fear of God [illegible] reliance but power and position [illegible] They party was a minority [illegible] zeal party, who saw with displeasure [illegible] best places in the community [illegible] and actually done nothing [illegible] themselves to [illegible] the twelve [illegible] had borne the brunt [illegible] But the majority were [illegible] view, who [illegible] person, that the [illegible] place. Everywhere in the provinces against the Caliphate [illegible] 'Othman's country [illegible] were and strong adherents. [illegible] energetic in [illegible] the deposition of 'Othman [illegible] [illegible] province as well as [illegible] seemed to give [illegible] there were [illegible] Mecca.

The malcontents [illegible] hand they came from the provinces 'Othman into [illegible] India and Oman to the [illegible] before the [illegible] two troops at hand. He reproached the malcontents [illegible] but as soon as they had gone he let matters take their old course. Thus three years went on [illegible] In the following year (655) the leaders of the rebels came once more from Egypt and Iraq to Medina with a more extensive following, and the Caliph accepted his former plan of making promises which he did not intend to keep. But the rebels sought him [illegible] fulfilment by which of his word, and now demanded his [illegible] action, he regained him as his own [illegible]

[1] He sought to make the whole nation a great host of God, the Arabs were to be soldiers and nothing else. They were forbidden to acquire landed estates in the conquered countries; all land was either made state property or was restored to the old owners subject to a perpetual tribute which provided tax on a splendid scale for the army.

[2] Noldeke, *Tabari*, 216. To 'Omar also is due the establishment of the Era of the Flight.

[3] Even in the list of the slain at the battle of Honain the Emigrants are enumerated along with the Meccans and Koraish, and distinguished from the men of Medina.

[4] It was [illegible] opposition of the party that afterwards [illegible] the Omayyads. The movement triumphed [illegible] 'Othman to the throne. But, that the party [illegible] not for principle but for personal advantage was apparent in the [illegible] Zobair and Talha [illegible] the followers of 'Ali.

defended by a few faithful subjects. As he would not yield, they at last took the building by storm and put him to death, an old man of eighty. His death in the act of maintaining his rights was of the greatest service to his house and a corresponding disadvantage to the enemy.

Controversy now arose among the leaders of the opposition as to the inheritance. The mass of the mutineers summoned 'Ali to the Caliphate, and compelled even Talha and Zobeir to do him homage. But soon the two, along with 'Aïsha, the mother of the faithful, who had an old grudge against 'Ali, succeeded in making their escape to Mekka, where at Basra they raised the standard of rebellion. Ali in point of fact had no real right to the succession, and moreover was actuated not by piety but by ambition and the desire of power, so that men of penetration, even although they condemned 'Othman's method of government, yet refused to recognize his successor. The new Caliph, however, found means of disposing of their opposition, and at the battle of the Camel, fought at Basra in November 656, Talha and Zobeir were slain, and 'Aïsha taken prisoner.

But even so 'Ali had not secured peace. With the murder of 'Othman the dynastic principle gained the twofold advantage of a legitimate cry—that of vengeance for the blood of the persecuted Caliph—and of a victim who could champion the Syrian governor Mo'awiya. Mo'awiya was not inclined to recognize 'Ali, and the latter did not venture to depose him. To have done so would have been useless, for Mo'awiya's position in Syria was impregnable. The kernel of his subjects consisted of genuine Arabs, not only in race and manners, alone with Islam, but also old settlers who, through contact with the Roman empire and the Christian church, had taken on a measure of civilization. Though the Ghassanids these latter had become habituated to monarchical government and loyal obedience, and for a long time much better order had prevailed among them than elsewhere in Arabia. Syria was the proper goal for the rise of an Arabian kingdom, and Mo'awiya was just the man to make use of the situation. He exhibited 'Othman's blood-stained garment in the mosque at Damascus, and incited the Syrians to revengefulness.

'Ali's position in Cufa was much less advantageous. The population of 'Irak was already mixed up with foreign elements; it fluctuated greatly, and was largely composed of fresh immigrants. Islam had not its headquarters here; Cufa and Basra were the home of the sect and of the adventurer, the centres of religious and political movement. This movement it was that had raised 'Ali to the Caliphate, but yet it did not really take any personal interest in him. Religion proved for him a much less trustworthy and more dangerous ally than the conservative and secular feeling of Syria for the Omayyads. Mo'awiya could either act or refrain from acting as he chose, and in either case of the obedience of his people. 'Ali on the other hand, was unable to convert either case for the principle ascribed on his banner into a reason for his position. It was necessary that he should accommodate himself to the wishes of his supporters, and at the same time it was impossible, for these wishes were inconsistent. They compelled him suddenly to bread on the battle of Siffin, which he was on the point of gaining over Mo'awiya, because the Syrians fastened copies of the Koran to their lances to denote that not the sword but the word of God should decide the contest (end of July 657). But in yielding to the will of the majority he aroused the displeasure of the minority, the genuine zealots, who in Mo'awiya were seeing the enemy of Islam, and who regarded 'Ali's entering into negotiations with him as a denial of the faith. When the negotiations failed and war was resumed, the Kharijites refused to follow 'Ali's army, and he had to turn his arms in the first instance against them. He succeeded in disposing of them without difficulty, but in his success he lost the soul of his following. For they were the true champions of the theocratic principle; through their elimination it became clear that the struggle had in no sense anything to do with the cause of God. 'Ali's defeat was a foregone conclusion; once religious enthusiasm had failed him; the secular resources at the disposal of his adversaries were far superior. Fortunately for him he was murdered (on 24th of January 661), thereby posthumously attaining a unique importance in the eyes of a large part of the Mohammedan world (Shi'a) which he had never possessed during his life. His son Hasan made peace with Mo'awiya.

The Kharijites are the most interesting feature of this phase of Islam. In the name of religion they raised their protest against allowing the whole great spiritual movement to issue in a secular and political result, in the establishment within the conquered territories of an Arabian Lineodom, a kingdom which diametrically contradicted the theocratic ideal. Islam was then on the point of making its peace with the world, not without a certain apostasy from its original principles, for which Mohammed himself had paved the way. Life was no more dominated by religion, but came to terms with it and parted company. The development was favoured by the government, which desired before all things to have peace. Orthodoxy arose, and thereby religion was tamed and directed to every dangerous element, strictly speaking, became a compromise, according to which the letter of the precept was correctly followed, in order that, in everything besides, a man might obey his own inclinations. The conditions under which any one might make sure of heaven were on the one hand the performance of "good works" as had a special church merit assigned to them, on the other hand, faith in the absolute sovereignty of God even over the wills of men. About morals God showed little concern—the usual view of orthodox shamanism. This was by no means the original standpoint of Islam, although the transition from it was made at an early stage, and by the Prophet himself. Originally Islam—as religious resignation—was only the complement of pious effort; a man set himself about even the hardest and apparently purposeless tasks, because he believed the issue to be entirely in the hand of God. But now all this was reversed, a man acted according to humour, because his destiny had nothing to do with his inherent qualities, but was dependent entirely on Allah's caprice. The Kharijites protested not merely against the dynastic principle and the rule of the Omayyads, but also against orthodoxy; they disputed the doctrine of predestination and the proposition that a grievous sinner could yet be a good Moslem, because they did not understand how to divorce religion from practice. To some degree they call to mind the Montanists, but their opposition was much more energetic in its expression.[1]

Sources.—For the history of Mohammed these are—(1) the Koran, (2) the theological historical tradition or Hadith. The latter is chronologically arranged in the biographies, of which those of Ibn Ishak and of Wakidi are the oldest and most important. Ibn Ishak's work in its complete form is now to be found only in Ibn Hishām's revision (ed. Wustenfeld), but large and numerous fragments of the original are given by Tabari (ed. de Goeje). Of Wakidi's *Kitab al Maghazi*, *i.e.* the history of Mohammed in Medina, is still extant (abridged German translation by Wellhausen, 1882); his collections for the earlier period are known to us through the work of Ibn Sa'd his secretary (*Tabakat*

[1] On the further development of Islam compare Houtsma, *De Strijd over het Dogma*, Leyden, 1875.

unedited). The Hadîth is set forth more systematically, according to subjects, in the great collections of tradition by Mâlik b. Anas, Bokhârî, Moslim, etc. (Bûlak editions). A subsidiary authority is the humanistic tradition of the Odaba, with which the poetry may be reckoned. The principal collections of this class are the *Kitâb al-Aghânî* (Bûlak edition) and the *Kâmil* (ed. Wright). For the period after Mohammed the most important work is the *Chronicle* of Tabarî (Leyden edition); the history of the conquest is treated briefly after the best authorities by Baladhorî (ed. De Goeje, 1866).

Literature.—The genuine tradition of the Arab with reference to their prophet was first introduced into Europe by the French beginning with Gagnier and ending with the valuable work of Caussin de Perceval. Weil and, after him, Noldeke especially, have the merit of having shown how to use the Koran in conjunction with the Arab tradition as a main source. Of modern biographies the most important are those of Muir and Sprenger; research has not yet got beyond them, although there is room for this. For the history of the Caliphs, the standard book is still the well-known work of Weil (although since it was published considerable additions have been made to our knowledge of the sources, especially to the labours of Dozy, De Goeje and other Dutch). Hitherto the main object has been to arrange together the material for this department of research, and a comprehensive treatment of the entire subject has not yet been accomplished. Still reference may be made in this connection to Dozy, *Histoire de l'Islamisme*, and A. von Kremer, *Geschichte der herrschenden Ideen des Islams* (*Kulturgeschichte des Orients unter den Khalifen*). (J. W.)

PART II. THE EASTERN CALIPHATE.

SECT. I. THE OMAYYADS.

1. In commencing the history of the Omayyad dynasty we must first recur to the causes which brought about the triumph of this family, and which led at once to the removal of Damascus for Medina as the seat of the Caliphate, an event which led to profound changes in the Moslem empire and exercised a considerable influence on its development. In the same way, at a later date, the transfer of the Caliphate from Damascus to Bagdad marked the accession of a new family to the supreme power, and gave Islam a new direction.

In the time of Mohammed the Arab were divided into an infinite number of tribes, some settled, other nomadic, which were constantly at war with each other. The Prophet united them into one body, but he could not entirely eradicate the hatred which had existed for ages between tribe and tribe. Thus the people of Mecca and those of Medina hated each other because the former were a branch of the race of Ma'add, the great ancestor of the tribes of the North,[1] while the latter belonged to the Yemenite race, or that of the South. The conquest of Mecca by Mohammed and his allies of Medina only exasperated this hatred, and the nobles of the Koraish swore to take revenge on the Yemenite, as soon as they should be able to do so. One of the most violent opponents of the Prophet had been, as we have seen, the father of that very Mo'âwiya who founded the Omayyad dynasty, Abu Sofyan, grandson of Omayya, the leader of the Meccan at the battle at Ohod; and it is related that his wife Hind, having found Hamza, Mohammed's uncle, among the dead, cut open his body, and tore out and devoured his liver. We have also seen how Abû Sofyân ultimately made his submission and embraced Islam, but only under compulsion. His son Mo'âwiya became, it is true, one of Mohammed's secretaries; but we know that his faith was never very strong, and that he always made his religion subordinate to the interests of his family. Even in his youth, he had conceived the project of recovering the supreme power for his own race, and it has been related above how the inner conflicts of Islam under the Caliphates of 'Othmân and 'Alî carried him forwards towards this goal.

Mo'âwiya might, no doubt, have marched to the help of 'Othmân with an army of Syrians, but the preservation of the Caliph, his relative, would not have served the purposes of his burning ambition, and we may say without hesitation that it was with secret joy that the prefect of Damascus heard of the fatal result of the plot against 'Othmân. The Syrians were entirely devoted to Mo'âwiya. Polite, amiable, and generous, he had gained the goodwill of all the Arabs of Syria, for whom Islam had remained a dead letter, and who, continuing Bedouins at heart, shared the feelings of their chief against the new aristocracy of Medina. Consequently, when 'Alî, the successful candidate, summoned Mo'âwiya for the last time to acknowledge him, and when Mo'âwiya, a cultivated man of the world, had read the message of Damascus, asked them what they replied that it was his part to command, and theirs to obey and to act. The enthusiasm of the Syrians was great, and Mo'âwiya having ordered a levy *en masse* within three days a very able-bodied man had joined the standard. Syria alone supplied Mo'âwiya with more troops than all the rest of the provinces put together had furnished to 'Alî, who is said to have addressed his soldiers with these bitter words: "I would gladly exchange ten of you for one of Mo'âwiya's soldiers." Then he added an allusion to the savage action of Hind, Mo'âwiya's mother, on the field of battle at Ohod: "By God! he will win the victory, the son of the liver-eater!"

'Alî's gloomy anticipations were fulfilled, but it was by stratagem that Mo'âwiya gained his victory. The battle of Siffin, the abortive negotiations that followed, and the withdrawal of the Kharijites have been already spoken of. The negotiations ended in the conference of Dumat-al-Jandal, a small place situated between Syria and Arabia, about seven days' journey from Damascus and three from Medina. Here in Ramadan, A.H. 37 (A.D. 658), Abu Mûsa and 'Amr ibn al-'As (the former conqueror of Egypt) appeared as arbitrators for 'Alî and Mo'âwiya respectively, and the summons of the latter induced Abû Mûsa to pronounce both pretenders deprived of what rights either might have to the Caliphate, and to say that it now rested with the Moslems to make a new choice. 'Amr, who was only waiting for the declaration to execute his turn, stood up and said to the Arabs who were crowding round the platform: "O people, ye have heard what Abû Mûsa says. He has himself renounced the claims of his candidate. I also agree to the deprivation of 'Alî, but I proclaim my master Mo'âwiya Caliph." Abu Mûsa cried out against this treachery, but no one would listen to him, and he fled for refuge to Mecca, where he ultimately recognised the claims of Mo'âwiya, even in 'Alî's lifetime. The event marks the commencement of the Omayyad dynasty. 'Amr went in triumph to Damascus, where the Syrians took the oath of fidelity to Mo'âwiya.

In 'Irak, on the other hand, with the exception of the Kharijites, all the people remained faithful to the memory of 'Alî who mounting the pulpit at Cufa, summoned the army to the field and fixed their rendezvous at Nokheila, a small place not far from the city. The Kharijites had taken refuge at Nahrowan, and 'Alî decided at once to attack them there, before marching against the Syrians. At his arrival most of the rebel dispersed, and only fifteen to eighteen hundred fanatics, who remained, threw themselves on the enemy and allowed themselves to be slaughtered to the last man. Thus rid of the Kharijites, 'Alî now prepared to direct his march towards Syria, but his soldiers refused to move, and declared their intention of returning

[1] The Ma'addites are also often called Modarites and Kaisites, after their ancestors Modar and Kais.

est at Cufa. Compelled to inaction, 'Alí returned to
Cufa, while Mo'awiya gave his attention to securing the
at the provinces. At the beginning of A.H. 38
A.D. 658-659, Egypt was lost to 'Alí. 'Amr b. al-'As
was reconquered by Mo'awiya, and marched without
delay, at the head of five thousand men, against 'Alí's
successor, Mohammed, son of the late Caliph, Abúbekr.
The governor appointed by 'Alí to the help of
Mohammed was poisoned at Kolzom by the prefect of
the place, a Omayyad under secret orders from Mo'awiya, and
his troops retraced their steps. Meanwhile in Egypt
all a partisan of the Omayyad, Mo'awiya b. Hodaij,
who was at the head of six thousand fighting men, had
declared against Mohammed and driven him from Fostat.
On his arrival in Egypt, 'Amr effected a junction with
Mo'awiya b. Hodaij, and the unfortunate Mohammed
was taken by his adversaries, fell into the hands of Ibn
Hodaij, who put him to death.

While Egypt was thus being lost to 'Alí, commotions
were excited in Arabia by a partisan of the Omayyads.
These were, however, put down by the governor of that
city, Ziyad. This man was Mo'awiya's own brother, but
illegitimate, and not having been acknowledged by his
father, Abu Sofyan, he had revenged himself by embracing the
party of 'Alí. Ziyad was renowned among the Arabs
for his eloquence, his prudence, and his courage. At a
later period, Mo'awiya seemed bent over to his cause by
publicly acknowledging him as his brother. At the time
we are speaking of, however, a faithful friend of 'Alí, and a
supporter of his cause, Mohammed, son of the late Caliph, Abúbekr.
The governor appointed by 'Alí to the help of
Mohammed was poisoned at Kolzom by the prefect of
the place, a Omayyad,

liph was not moved; threats prevailed over the
y of the people of 'Iráḳ, and Moʿawiya repaired to
n person, at the head of an army, to intimidate the
nts of Mecca and Medina. As may be supposed,
cipal fomenters of the resistance in Arabia were
s of the first Caliphs, 'Abd al Raḥman the son of
r, 'Abdallah the son of 'Omar, and Hosain the
Alí; for, by submitting, they would have renounced
of being themselves chosen by the people. Another
ḥ, son of that Zobair who had been among the
idates nominated at the death of 'Omar for the
of the Moslems, was also one of the warmest
nts of the pretensions of Moʿawiya. All the efforts
Caliph to win over these personages to his side
proved vain, he ordered them to be brought into
sque at Mecca, each between two soldiers; then,
mounted the pulpit, he called on the by-standers to
oath of allegiance to his son, adding that 'Abd
man, Hosain, and the two 'Abdallahs would refuse no
n. They, in their terror, did not utter a word, and
mbly took the oath. Then Moʿawiya, without con-
himself further about the malcontents, returned to
ns.

thus occupied at home, Moʿawiya did not neglect
affairs. 'Amr b. al 'Aṣ, governor of Egypt, died
A.D. 663-664), and was followed by several pretend
ssion, under one of whom the general Moʿawiya
undertook several expeditions into the province
ca. In the year 50 (A.D. 670) he advanced as
'Aqaqa, now Sus, near which city he laid the
ions of the celebrated Kairawan, and even went
Sabaratha, a town situated near the sea-shore, and
to the island of Crete. The emperor, Constantine
l sent thither thirty thousand Greeks who were
and compelled to re-embark in haste. Moʿawiya re-
eturned to Egypt after his victory and the Caliph
sidered the position of the Moslems in Africa so
that he separated that province from Egypt, and
d as governor of Africa 'Oḳba b. Nafi', who pro-
y established Kairawan, in a plain situated at a
stance from the first encampment of Moʿawiya b.
According to some historians, the new city was
ed A.H. 55 (A.D. 674-675).

East the successes of the Moslems were still more
. Ziyad, brother of Moʿawiya, as soon as he was
ed governor of 'Iraḳ and Persia, sent an army into
n. It advanced as far as the Oxus, crossed that
nd returned loaded with booty taken from the
ng Turkish tribes of Trans-oxiana. Bokhara was
l by a son of Ziyad, and Saʿíd, son of the Caliph
n, whom Moʿawiya had made governor of Khoraʿsan,
l against Samarkand, A.H. 56 (A.D. 675-676);
generals penetrated as far as the Indus, and over-
l conquered Múltan, Kabulistan, Mokran, and

e North the Moslems were not less fortunate in
tacks on the Byzantine empire. Moʿawiya, while
ly governor of Syria, had gained possession of
, and had sent a fleet against Cyprus, which, in
tion with that of the governor of Egypt, had
the conquest of that island. Encouraged by the
f this expedition, he gave the order for new incur-
the Mediterranean. His fleet of twelve hundred
invested the islands of Cos, Crete, and Rhodes.
ous Colossus of Rhodes was broken to pieces, and
l that the bronze of which it was made was bought
w of Emesa, and formed a load for nine hundred
hty camels. The Arabs even dared to threaten
tinople, which owed its safety only to the Greek
Yazíd, the son of Moʿáwiya, took part in these
expeditions, but with no great ardour; and in the year 5
(A.D. 677-678) Moʿawiya concluded a thirty years' peace
with Constantine IV. Two years later, he died at Dama-
cus, after a reign of nearly twenty years. He had been
governor of Syria for the same length of time. Before his
death, he sent for his son Yazíd, and having pointed out
how he had smoothed down all difficulties for him, he
advised him to pay no effort to preserve the attachment
of the Syrians. He urged him also to keep a close watch
on the actions of Hosain b. 'Alí, and of the other pre-
tenders who had refused to take the oath of allegiance to
him, but he added that, should they rebel, Yazíd ought
to treat them with clemency, and not to forget their illus-
trious origin. By failing to act upon this wise advice
Yazíd rendered irreconcilable that formidable schism which
even at the present day, till divides the Moslem world,
and which, at all period, has been a cause of calamity to
Islam.

Yazíd had not his father's consummate diplomatic
talent of playing off one party against another, he became
more cautious on forming a pretty complete idea of consol-
idating the stability of his empire. During his short reign
he committed three actions for which Moslem never
pardoned him, namely, the murder of Hosain, son of 'Alí
and grandson of the Prophet, the pillage of Medina, and
the taking of the Kaʿba, the venerated temple of Mecca.
crimes which were not redeemed in the eyes of the people
by a few fortunate expeditions on the part of his generals.

Immediately on ascending the throne, in the month
Rajab A.H. 60 (April A.D. 680), Yazíd sent a circular to all
his prefects, with an official announcement of his father's
death, and an order to administer the oath of allegiance to
their respective subjects. In particular, he charged the
new prefect whom he appointed to Medina, his own cousin
Walíd b. 'Oḳba, to take off the head of Hosain son of
'Alí, 'Abd al Raḥman son of Abú Bakr, 'Abdallah son of
'Omar, and 'Abdallah son of Zobair, if they should refuse
to acknowledge him. Terrified at such a command,
Walíd did not dare to act with promptitude against Hosain and
'Abdallah b. Zobair, both of whom refused to take the
oath, but allowed them to escape to Mecca. Yazíd
immediately deprived him of his office, and appointed in
his place 'Amr b. Saʿíd, already governor of Mecca. One
in the Holy City, 'Abdallah b. Zobair threw himself in
such perfect safety that he began to intrigue with the
Meccans, to have himself proclaimed Caliph in Arabia.
At Cufa the news of the flight of Hosain produced great
agitation among the partizans of the family of 'Alí, who
were numerous there, and they sent several addresses to
the grandson of the Prophet urging him to take refuge
with them, and promising to have him proclaimed Caliph
in 'Iraḳ. Hosain, who knew the fickleness of the people
of 'Iraḳ, hesitated to yield to their entreaties, but the
Zobair, who was desirous to get rid at all costs of so
formidable a rival, persuaded him that he ought to go
and put himself at the head of the people of 'Iraḳ, and
enter on an open struggle with Yazíd. Hosain began by
sending his cousin Moslim b. 'Aḳíl to Cufa, and from him
he learned that many of the inhabitants of that city
appeared really devoted to support him. The prefect of
Cufa, Noʿmán b. Bashír, though apprized of the approach
of the prince, did not choose to make them known to Yazíd,
as he was reluctant to act with severity against the grand-
son of the Prophet. Information, however, reached the
Caliph, who deprived Noʿmán of his office, and ordered

[1] Sabora b. Ziyad invaded Seistan, and returned to Bassora with immense booty to Merv. In Africa 'Oḳba b. Nafi' marched to the Atlantic coast; the Mediterranean so far as Tangiers on the Straits of Gibraltar; and fell not in an ambuscade laid by the Berbers, who killed him and took Kairawan.

Obaid Alláh, son of the famous Ziyád, and then governor of Basra, to give up the post there to his brother 'Othmán, and to repair in person to Cúfa, in order to watch the partisans of 'Alí in that city. 'Obaid Allah obeyed, entered Cúfa, and ascending the pulpit the very day after his arrival proudly announced his firm intention of putting to death any one who should rebel. Moslim b. 'Akíl was given up by a traitor and executed. Meanwhile Hosain, on receiving the communications despatched, had already set out from Mecca with all his family, and had reached Kadisiya, a place situated only fifteen parasangs[1] from Cúfa and noised for the defeat sustained there by the Persians under the Caliphate of 'Omar, when he received the vexatious tidings. He wished to retrace his steps immediately, but the friends of Moslim dissuaded him from doing so for revenge, and representing to him that doubtless he had only to show himself under the walls of Cúfa to be received with enthusiasm by its inhabitants. Hosain accordingly pursued his journey towards Cúfa. But 'Obaid Allah, who was watching all his movements, sent four thousand horsemen, devoted to the Omayyad cause, to meet him, with orders to bring Hosain before him either alive or dead. The commander of the horsemen was 'Omar b. Sa'd,[2] to whom 'Obaid Allah had promised the government of Medina as a reward, if his expedition should succeed. The Omayyads met Hosain in the plain of Kerbela, opposite to Cúfa, before he had reached the Euphrates, and surrounded him. 'Omar b. Sa'd himself brought out Hosain and summoned him to surrender. Hosain declared himself ready to renounce his pretensions, provided he were allowed to return to Mecca with his followers, or were even sent to Damascus. When 'Obaid Allah was informed of this proposal, he simply repeated his former order to bring Hosain to Cúfa, dead or alive, and, learning the defection of 'Omar b. Sa'd, he sent out other troops under the orders of a certain Shimr. On the 9th of Moharram in the year 61 (9th October A.D. 680), Shimr reached Kerbela, and summoned Hosain afresh to surrender at discretion. Hosain preferred to die sword in hand, and on the following day, after a desperate struggle, he was cut down with all his followers. His head was sent off and carried to Cúfa, and then sent to Damascus. His body was not buried till the following day. Only the women of his family were spared, and one of his sons, these were taken by Yazíd's order to Medina, where the sight of their mourning and the tale of their sufferings caused a profound sensation. The horror and grief of the partisans of 'Alí's family were great. Hence the names of Yazíd, 'Obaid Allah, and Shimr, have been held accursed ever since by the Shí'ites. They observe the 10th of Moharram as a day of public mourning. Among the Persians, stages are erected in public places on that day, and plays are acted, representing the misfortune of the family of 'Alí.[3] The Omayyads themselves were loud in their reprobation of this impious massacre, and all Moslems without distinction of party, considered it a most foul act.

At Mecca the news was received with a decree of indignation of which 'Abdallah b. Zobair took advantage to assume the title of Caliph. Arriving A.H. 60, the new prefect of Medina had tried to secure his person. He had sent against him a force of two thousand men, at whose head was placed a brother of the pseudo-Caliph himself, called 'Amr, who, having been accused by 'Abdalláh of maintaining a guilty intercourse with one of his wives, had become his bitter enemy. 'Abdalláh collected an army, and placed it under the orders of 'Abdalláh b. Safwán, who completely defeated the Omayyad troops. The brother of the pseudo-Caliph was taken and put to death. At the news of this defeat, Yazíd swore that Ibn Zobair should never appear before him but as a prisoner in chains. He dismissed the new prefect of Medina, and nominated Walíd b. 'Otba, who, in the year 61, went to Mecca to try to seize 'Abdallah b. Zobair. The latter, in derision, wrote to Yazíd: "Walíd is a mad man, who will ruin everything by his folly; send in his place another governor to repair the wrongs he has done." Yazíd thought that 'Abdallah meant these words as a step towards reconciliation, hastened to deprive Walíd of his office; appointed 'Othman b. Mohammed in his place, and even sent envoys to Ibn Zobair. He, however, would not listen to them. He thought he could reckon upon the devotion of the people of Mecca, and further hoped that Medina itself would declare against Yazíd. This, in fact, took place in the year 63 (A.D. 682-683). The people of Medina, having been roused by a certain 'Abdallah b. Hanzala, who had had a near view of Yazíd at the court of Damascus, and had been scandalised by the profligacy of his life, revolted, drove the governor and all the Omayyads out of Medina, and proclaimed the dethronement of Yazíd. The Caliphate was even offered by some to 'Alí, that one of the sons of Hosain who had escaped the massacre of Kerbela; but 'Alí wisely refused it. At the news of this revolt Yazíd first sent an ambassador to Medina. This step proving fruitless, he next collected an army of from ten to twelve thousand Syrians, and entrusted their command to Moslim b. 'Okba, who passed, and with good reason, for a man who would recoil from nothing. This general, though weighed down by age and sickness, marched against Medina, took it, after a battle known as the day of Harra[4] (26th Dhu l-Hijja 63, 26th August 683), and gave up the city for three days to massacre and pillage. Torrents of blood flowed, and hence Moslim b. 'Okba received the surname of *Mosrif* (the Prodigal). On the fourth day, Moslim repaired to the mosque, and received the oath of allegiance from all those of the citizens of Medina who had not been able to make their escape. The news reached Mecca a few days later, and fell like a thunderstroke on Ibn Zobair and his adherents, who prepared for war, expecting from day to day to see Moslim appear before the walls of their city. He had, in fact, started for Mecca immediately after the conquest of Medina; but he died on the road, and the command was taken by Hosain b. Nomair. The Omayyad army arrived before Mecca a month after the capture of Medina, and found Ibn Zobair ready to defend it. A number of the citizens of Medina had come to the aid of the Holy City, as well as many Kharijites and Shí'ites, at the head of whom was a certain Mokhtár b. Abí 'Obaid, who subsequently played a very important part in 'Irák. In spite of the efforts of the Meccans, the Syrian army invested the city. Hosain b. Nomair had caused balistas to be placed on the neighbouring heights; and these, under the management of an Abyssinian soldier, hurled against the Ka'ba enormous stones and vessels full of blazing bitumen, with such effect that the temple took fire and was consumed. After a siege of two months, Ibn Zobair was beginning to despair, when he received, through an Arab of the desert, news of the death of Yazíd. The Caliph had in fact died on the 15th of Rabí' I. (11th November 683).

[1] The parasang is nearly equivalent to an English mile.

[2] Son of the famous Sa'd b. Abí Wakkás, conqueror of Persia under 'Omar, and founder of Cúfa.

[3] Shí'ites comes from *Shí'a*, a word which in Arabic signifies "sect." It is the name given to the partisans of the family of 'Alí, who acknowledge no legitimate Caliphate outside of that family. Shí'ism is the religion of Persia.

[4] See Chodzko, *Théâtre persan*, Paris, 1878.

[5] Harra is the volcanic district outside of Medina. One of the gates of the city is called the Gate of Harra.

Hosain b. Nomair immediately offered the Caliphate to Ibn Zobair, on condition that he should grant a complete amnesty to all those who had taken part in the battle of Jarra and in the siege of Mecca. 'Abdallâh had the folly to refuse, and Hosain then returned to Damascus.

Thus rid of his enemy, 'Abdallah caused the title of Prince of the True Believers (Amir al mo'minin) to be conferred on him — a title which 'Omar had already received, and which was afterwards adopted by all the Caliphs. He sent one of his brothers, 'Obaid Allah, to Medina, and chose as governor of Egypt 'Abd al Rahman b. Jahdam, who repaired to that province, and caused the authority of Ibn Zobair to be acknowledged there. At Basra and at Cufa, many of the inhabitants did not hesitate to acknowledge him, and received a Zobairite governor, while the Kharijite and the Shi'ite took up revolt — the former at Basra under the leadership of Nafi' b. Azrak, the latter at Cufa under that of Solaiman b. Sorad — and expelled the Omayyad governor, 'Obaid Allâh b. Ziyâd, who took refuge at Damascus. Mesopotamia soon followed the example of Irak. Everywhere the population seemed disposed to abandon the cause of the Omayyads. The Kharijite and Mokhtar b. Abi 'Obaid, who had supported Ibn Zobair, now deserted or betrayed him in favour of this pretender, and quitted Mecca. The son of Zobair, remaining thenceforth master of Mecca, occupied himself tranquilly in rebuilding the Ka'ba, which he restored on its ancient foundations.

3. It was in the midst of this break-up of his party that, immediately after the death of Yazid, his eldest son, Mo'awiya II., was elected Caliph at Damascus, at the age of only seventeen or twenty. He was a young man of weak character, and imbued, it is said, with Shi'ite opinions. He felt himself incapable of ruling and was contemplating abdication, when he died, after a reign of but forty days, by poison, as some say; of the plague, as others assert. The Caliphate was immediately offered to 'Othman b. Otba b. Abi Sofyan, cousin of Mo'awiya II., to Khalid, the second son of Yazid, who was only sixteen years old. 'Othman b. 'Otba, however, having made it a condition of his election that he should not be compelled to enter on any war, or to condemn any one to death, the choice fell at Damascus on Merwân b. al Hakam, a descendant of Omayya through his grandfather Abu l'As, but on condition that he should marry Marjan, the widow of Yazid, and should appoint Khalid, her son, as his successor.

4. Merwán b. al Hakam had been secretary to the Caliph 'Othmán, and governor of Medina under Mo'awiya. Yazid, on his accession to power, had dismissed him and put Walid b. 'Otba in his place, but Merwan had continued to live at Medina, and had been driven from it during the revolt of the year 63, and again in the following year, when 'Obaid Allah b. Zobair had taken possession of that city in the name of his brother. It might have been thought that Merwan would cherish a deep hatred of 'Abdallah Ibn Zobair, but he was an old man of sixty-two at the time of his election, and, dreading an unequal struggle, he was on the point of making his submission to the Meccan Caliph. The drooping courage of Merwan was revived by his son 'Abd al-Melik and by 'Obaid Allah b. Ziyâd, and he resolved to try the chances of war.

Dahhâk b. Kais, governor of Damascus, had declared himself on the side of Ibn Zobair, and had raised an army, principally from among the tribe of Kais. This tribe had taken offence because Mo'âwiya I. and Yazid had chosen their wives from the Yemenite tribe of Kalb, and, continuing to resent their conduct, now refused to acknowledge Khâlid as the heir-presumptive of Merwán. It was therefore on the Yemenites that Merwán had to depend for the suppression of Dahhak's rebellion. The latter had an army of nearly sixty thousand horsemen, while Merwan could bring together only thirteen thousand infantry. The two armies met at Marj Rahit, a few miles from Damascus, and, after a series of combats which lasted for twenty days, Merwan's troops gained a complete victory, and Dahhak was among the killed. The Syrian province hastened to acknowledge the conqueror, and Merwan was able to turn his attention to Egypt, which, as will be remembered, had submitted to the Meccan. 'Abd al 'Aziz, a son of Merwan, had already marched to Aila on the Red Sea and was preparing to enter Egypt. Merwan joined him, and the Zobairite governor of Egypt, beaten by their united forces, was obliged to seek safety in flight. Merwan made 'Abd al 'Aziz governor of the province. At the beginning of the year 65 (end of 684-685) Merwan returned in haste to Syria, for, during his absence, a brother of Ibn Zobair, named Mo'adh had invaded the province. Merwan triumphed over Mo'adh but an army of forty thousand men which he had sent to the Hijaz, and in which was Hajjaj b. Yusuf, then quite a young man but who afterwards played so important a part under 'Abd al Melik, was cut to pieces. This defeat was redeemed by a victory gained by his general, 'Obaidallah b. Ziyad and Hosain b. Nomair, at 'Ain al Ward over a small army of Shi'ites led by Solaiman b. Sorad; but while the battle was being fought in Ramadan 65 (April-May 685), Merwan died, suffocated, it is said, by his wife Marjan, because he had insulted her son Khalid and had broken his word by nominating his own son 'Abd al Melik as his successor. The accession of 'Abd al Melik was attended with no difficulty, as he was acknowledged by the whole of Syria and Egypt. The Kais naturally rallied round him because he had not a drop of Yemenite blood in his veins.

5. When 'Abd al Melik ascended the throne, there still remained much to be done before the unity of the empire could be re-established. Ibn Zobeir was still master of Arabia and of 'Irak, though in the latter province his authority was very much shaken by the permanent rebellion of the Shi'ites at Cufa and of the Kharijites at Basra. The Zobairite general Mohallab had, it is true, succeeded in forcing back the Kharijite into Sistan and Persia, but at Cufa the Shi'ite, at the instigation of Mokhtar, continued their agitation. Mokhtar, as we have seen, had withdrawn from Mecca after the retreat of the troops of Hosain b. Noman. He returned to Cufa, and there fomented serious disturbance. Many of the inhabitants of that city repented bitterly of having allowed Hosain to put to death the grandson of the Prophet to be massacred. Amid the general disorder of the Moslem empire Mokhtar hoped to make his own authority acknowledged in 'Irak and Mesopotamia. He put himself forward as the avenger of the family of 'Ali and pretended to have been commissioned by a son of 'Ali, Mohammed b. Hanafiya,[1] who was living at Medina, to give effect to his claims to the Caliphate. Many Shi'ites believed him, and, determined their chief, Solaiman b. Sorad, joined Mokhtar. On learning the intrigues the Zobairite governor threw him into prison. Soon after the defeat of Solaiman at 'Ain al Warda, at the request of Mokhtar, his brother-in-law, who was no other than 'Abdallah the son of 'Omar, the governor consented to set him at liberty on his swearing to make no further attempt against him. As Solaiman had fallen on the

The ... received the name of Kaisanites from a freedman 'Ali, called Kaisán, who was the most ardent advocate of Mohammed's pretensions. After Mokhtar had declared in favour of Mohammed his supporters received the name of Mokhtarites.

field of battle at 'Ain al Warda all the Shi'ites now acknowledged Mokhtar as their chief. He, however, considered himself bound by his oath, remained inactive until the governor who had imposed it was replaced by 'Abdallah b. Mo'ti. The new Zobairite governor, suspecting with reason that Mokhtar was about to recommence his intrigues, thought it advisable to invite him to his presence. At the instigation of his friends Mokhtar accepted the invitation, but plotted with them to kill Mo'ti by surprise. A however self-confident, he did not venture to hold a levee each week, for the purpose of gathering troops, Mokhtar was obliged to screen all these preparations under the ceremonial customary on the occasion of the Friday prayer. Mo'ti, however, had been warned by his body-guard, Abu Shaiba Sa'd, who had only demanded the dismissal of his servants in order to ascertain the real wishes of Mohammed b. Hanafiya, cut off four of the latter's fingers on the night of the 13th to the 14th, the conspirators intended to occupy the principal gates of the city by a *coup de main*, but the governor was on his guard, and Mokhtar and his friends took the course of besieging Qasr Ibn Mokaitil and other strongholds. All the troops which 'Abdallah b. Mo'ti could muster there were successively beaten, and Mokhtar soon remained master of Qufa in triumph, compelling the Zobairite governor to flee to Basra. Once master of Qufa, Mokhtar chose a council already in existence of the chief men of the Shi'a. He sent envoys to Medina to Mohammed b. Hanafiya, to Mecca and even into Azerbaijan, with the view to induce the people to take the oath of allegiance to him. He then sent his general Yazid b. Anas and Sa'id b. Hodhaifa, against the Omayyad troops which had entered Mesopotamia after the battle of 'Ain al Warda and thus prevented the advance of the Syrian army into Iraq. Another of Mokhtar's generals, Ibrahim b. Malik al-Ashtar, defeated a Syrian force on the Syrian road near Mosul, and Obaid Allah b. Ziyad, who commanded them, fell in the battle. Ibrahim was rewarded by Mokhtar with the government of Mosul. Mokhtar himself next took the title of "Lieutenant of the Family" and inserted in the *khotba* on Friday prayers, prayers on behalf of Mohammed b. Hanafiya, who had given consent to declaring him Caliph. After this, seated on his throne, surrounded by his adherents, he caused all those who had taken part in the murder of Hosain, the grandson of the Prophet, viz. 'Omar b. Sa'd and Shimr, to be brought out and put to death.

While these events were occurring, the Caliph at Damascus 'Abd al-Malik, sent an army of observation to the frontiers of Mesopotamia. Mokhtar, having been informed of this, despatched a force of cavalry and men from Qufa, under the command of a certain Sharahil. His real object was to concentrate forces near Medina, with a view to attacking Ibn Zobair. But the latter penetrated his design, and two thousand Meccan men-at-arms were sent by his order to meet Sharahil, who was defeated.

In the same year (A.H. 66 = Mohammed b. Hanafiya had come to Mecca to perform the ceremonies of the pilgrimage.

[1] Mahdi, in the well-known, and by none more than by the Shi'ites to their member of the family of 'Ali who, according to their belief, is one day to regain possession of the whole world and set up the reign of righteousness in it. In Mokhtar's time, Mohammed b. Hanafiya was looked upon as the Mahdi.

Ibn Zobair took advantage of this to seize his person, and confined him in a small house adjoining the well of Zamzam within the precincts of the Ka'ba. Mohammed succeeded in conveying intelligence of his detention to Mokhtar; and he, delighted to find his friend implored by the very man whose followers he called himself, swore to effect his release. He despatched a thousand chosen horsemen, who managed to conceal their march so well, that they were under the walls of Mecca before the son of Zobair had been able to make the slightest preparations for defence. They made their way into the Holy City; but, being unwilling to draw the sword within that sacred ground, they armed themselves with clubs, broke in the door of the house in which Mohammed b. Hanafiya was imprisoned, released him, and escorted him out of the city. A son of Mohammed, called 'Ali, who had also been thrown into prison, likewise succeeded in escaping, and rejoined his father at Qaraqisa, near Mecca.

In the following year, Ibn Zobair, who was determined to get rid, at all costs, of so dangerous an adversary as Mokhtar, ordered his brother Mosfab to effect a junction with Mohallab, the governor of the Kharijites, and to march against Qufa. Mosfab and Mohallab invested the city, and Mokhtar's chances of resistance against them, were few. Taken prisoner, and beheaded 'Irak thus, for the second time, fell under the rule of Ibn Zobair. Ibrahim b. Malik, who held Mosul in the name of Mokhtar, submitted to the conqueror, on condition of retaining his government. But Mosfab deprived him of his office and put Mohallab in his place. He himself was appointed governor of 'Irak by his brother, and having installed himself at Basra, placed Qufa under the orders of his lieutenant Harith. The year after, the Kharijites of Sejestan raised a fresh insurrection, and invaded 'Irak. Mohallab had to be recalled from Mosul and during his absence it was Ibrahim b. Malik whom Mosfab chose to supply his place. The period of the pilgrimage caused a momentary truce to all these struggles, and in that year was seen the curious spectacle of four different standards planted near Mecca, belonging respectively to four parties chief, each of whom was a pretender to the empire: the standard of 'Abdallah b. Zobair, Caliph of Mecca; that of the Caliph of Damascus, 'Abd al-Malik; that of the son of 'Ali, Mohammed b. Hanafiya; and that of the Kharijites, who were at that time under the command of Najda b. 'Amir. Such, however, was the respect inspired by the holy places, that no disorder resulted from the presence of so many inveterate rivals.

The Omayyad Caliph, whose troops had been beaten at Mecca, and who had been hitherto content to watch the frontier of Arabia, was again prevented from carrying on his military operations more actively by the breaking out of trouble in Syria. At the beginning of A.H. 69 (A.D. 688-689), 'Abd al-Malik having left Damascus at the head of a numerous army, with the purpose of marching against 'Irak, the Omayyad 'Amr b. Sa'id, whom he had appointed governor of Damascus, took advantage of his absence to lay claim to the supreme power and to have himself proclaimed Caliph by his partisans. 'Abd al-Malik was obliged to retrace his steps, and to lay siege to his own capital. The garrison of Damascus took fright, and deserted their posts, so that 'Amr b. Sa'id, abandoned by his followers, was compelled to surrender at discretion. 'Abd al-Malik at first meant to spare him, but he afterwards changed his mind, and struck off his head with his own hand. Scarcely had he suppressed this revolt when the Emperor of Constantinople, Justinian II., in violation of the thirty years' truce formerly concluded between Mo'awiya I. and Constantine IV., sent a Greek army to invade Syria. 'Abd al-Malik was obliged to buy peace

or the time, for he required all his forces to dispute the mpire with the son of Zobair. He consented, it asserted, to pay the Greek- an indemnity of one thousand ieces of gold weekly. He then gave his attention to the newal of the projected expedition against 'Irak. Mo'ab he Zobairite had rendered himself odious to the inhabitants of Basra and Cufa by his exactions, and a party favourable to 'Abd al Melik was already formed in those ities. The Omayyad Caliph marched forth at the head f an army composed of Syrians and Egyptians, and ncamped three parasangs from the plain of Dur al 'Athalik, not far from the site of Baghdad where Mo'ab ad established his army. Before joining battle 'Abd al Melik had written secretly to all the chiefs of Mo'ab's my, making them the most seductive promises if they would agree to desert the cause of Mo'ab. This proved rowned with success; and on the eve of the battle which ook place on the 13th Jomadi II. A.H. 71 (13th ember 690), several of the principal officers of amp of 'Abd al Melik with their troops passed over to attacked his enemy the next day. In the course of the ound himself deserted by his troops and by the chiefs of o survive his defeat, he entered Basra by night and victory opened the gates of that city to 'Abd al Melik had received him with acclamations. His sons at Cufa, and their partisans in the province, sent to as brother Bishr, while Khalid b. 'Abdallah, governor of Basra, he returned in triumph to Syria. Soon after, the Omayyad arms became victorious over those of the Kharijites in Fars (Persia), the Caliph's brother Mohammed so much against these sectaries with the support of Mohallab, who was their terror, and of the succession Rey. Khalid succeeded completely in the same province and drove the Kharijites out of Khorasan and Kirman. On his side, the Omayyad Caliph put down revolt in Khorasan, a province which still remained faithful to the Zobairite cause. Its governor was treacherously assassinated by his lieutenant Rafi', who proved, on the ories of this service, the governor here of the province.

Only Arabia now remained to the Zobairites. In person 'Abd al Melik made preparations to depose him at last. Accordingly he raised an army, but when his generals found that another siege of Mecca was in contemplation, not one of them was willing to accept the command. At obscure officer, Hajjáj b. Yusuf, boldly offered to lead the expedition. 'Abd al Melik had little confidence in him, and therefore at first placed only two or three thousand horsemen under his command. Hajjáj at once passed into the Hijaz without resistance, and pitched his camp at Taif, not far from Mecca. Ibn Zobair tried to dislodge him, but in the frequent encounters between his troops and those of Hajjáj, the latter always had the advantage. 'Abd al Melik then decided on sending him a reinforcement of five thousand men, on receiving which Hajjáj moved to Mecca. The blockade lasted several months, during which the city was a prey to all the horrors of siege and famine. Hajjáj had set up ballistas on the neighbouring heights and poured a hail of stones on the city and the Ka'ba. Famine at length triumphed over the last adherents of the son of Zobair. Ten thousand fighting men, and several of the sons of the pretender, left the city and surrendered. Mecca being thus left without defenders, Hajjáj took possession of it and invested the Ka'ba. Then the son of Zobair, seeing that ruin was inevitable, went to his mother Asmá, who had reached the age of a hundred and asked her counsel. She answered that he must die sword in hand; and when, in embracing him for the last time, she felt the cuirass which he wore, she exclaimed that such a precaution was unworthy of a man resolved to perish. 'Abdallah took off his cuirass, and taking refuge in the Ka'ba, passed the night there in prayer. At daybreak, the 14th of Jomadi I. in the year 73 (1st October 692), the Omayyad troops made their way into the mosque. 'Abdallah attacked them furiously, notwithstanding his advanced age, but at last fell overwhelmed by numbers. His head was cut off, carried to Hajjáj, and sent by the victorious general to Damascus.[1]

With Ibn Zobair perished the influence which the companions of Mohammed had hitherto exercised in Medina and Mecca, though they continued to be the [illegible], had no longer that political importance which had marked their position in the early days of Islam. Temporal supremacy was henceforth to be vested in the house of Omayya, which, with Damascus as its capital, was to rule the Moslem world for nearly a century.

overnor of Khorá. (n.)[1] whence he directed several expeditions against Transoxiana.

While Mohallab was fighting against the Khárijites in Persia, Hajjáj himself had had to struggle against rebellion. Three Kharijite chiefs, Sálih, Shabib, and Motarrif, had succeeded in creating a party in Mesopotamia and 'Irák. [illegible] had even [illegible] its audacity so far as to march upon Cufa, and for a moment had occupied that city. Hajjáj overcame the rebels, and through his vigilance, Katari b. al Fujá'a, another Kharijite chief, after having penetrated as far as Tabaristán, on the Caspian Sea, was taken and killed by two Omayyad generals.

When to give the government of Khorásán to Mohallab, Hajjáj had committed that of Sijistán to 'Obaid Alláh b. Abi Bakra. At the beginning of A.H. 79 'Obaid Alláh's troops were beaten by the Prince of Kabul. Hajjáj thought advisable to remove 'Obaid Alláh and to replace him by the captain of his guards, Abd al Rahmán b. al Ash'ath. The was a bad choice, for Ibn al Ash'ath had often given proofs of an insubordinate temper, and Hajjáj soon had occasion to repent of it. In fact, soon after his arrival at Sijistán, he [illegible] but even [illegible] its audacity so far as to march upon Cufa, and for a moment had occupied that city. Hajjáj overcame the rebels, and through his vigilance, Katari b. al Fujá'a, another Kharijite chief, after having penetrated as far as Tabaristán, on the Caspian Sea, was taken and killed by two Omayyad generals.

At the beginning of A.H. 79 'Obaid Alláh's troops were beaten by the Prince of Kabul. Hajjáj thought advisable to remove 'Obaid Alláh and to replace him by the captain of his guards, Abd al Rahmán b. al Ash'ath. The was a bad choice, for Ibn al Ash'ath had often given proofs of an insubordinate temper, and Hajjáj soon had occasion to repent of it. In fact, soon after his arrival at Sijistán, he marched against Rutbil, the Prince of Kabul, whom he defeated in Jomádi II., A.H. 80 (July 699), at the first action that took place. Victory declared for Hajjáj. Ibn al Ash'ath fled to Bárizá, where he managed to collect the troops; but, having been again beaten, he took refuge in Sijistán, from which he was driven by a son of Hajjáj. The rebel then retreated into Sijistán, and afterwards sought an alliance with the Prince of Kabul. As soon as his partisans had reported how he penetrated into Khorásán, in order to start an insurrection there. The governor of this province was at that time Yazíd, son of the celebrated Mohallab, who had died in the year 82. Yazíd marched against Ibn al Ash'ath, and cut his army to pieces. From that time the poet more disappeared, and it is thought that, having again taken refuge with the Prince of Kabul, he was betrayed by him and put to death.[2] It was during

[1] In A.H. 78, 'Abd al Malik had taken measures to render independent on the governor of Irák [illegible] Hajjáj and the right of directly nominating the governors of those provinces.

[2] The Prince of Kabul is called both Rutbil by some historians, and Zunbil by others. See Weil, *Geschichte der Chalifen*, i. 419; Tabari, transl. by Zotenberg, iv. 127 *seq.* Mirkhond, transl. by Rehatsek and de Meynard, index, s. v. Rotbil. According to Abulfeda's *Geography*, p. 343, Ibn al Ash'ath was killed in the province of Arrokhaj (Arachosia), and his head was sent to Damascus and Egypt.

this long struggle that, in the year 83, Hajjáj laid the foundations of the city of Wásit (the Intermediate); so called because it is situated midway between Cufa and Basra. Some time after the suppression of this revolt, in the year 84, Hajjáj deprived Yazíd b. Mohallab of the government of Khorásán, accusing him of partiality towards the rebels, and appointed in his stead first his brother Mofaddal b. Mohallab, and nine months after Kotaiba b. Moslim, who was destined at a later period to extend the sway of the Moslems in the East as far as China.

While these events were taking place, 'Abd al Malik was engaged in the West in a struggle against the Greeks. We have seen that in the year 69 the Caliph, compelled at the then war to direct all his efforts towards 'Irák and Arabia, had concluded a disgraceful peace with Justinian II. It was not till A.H. 73 (A.D. 692-693) that he resumed hostilities in Armenia, Asia Minor, and Africa. The operations in Asia Minor and in Armenia were entrusted to Mohammed b. Merwán, brother of the Caliph, and to 'Othmán b. Walíd. They beat the Greeks at first, but, in consequence of subsequent reverses, the Moslems were compelled to accept peace, which was broken shortly by the Greeks about the year 75 or 76, the Caliph in one of his letters to Justinian II. having used expressions which displeased the Christian monarch. In retaliation, Justinian threatened to have legends offensive to Islám struck on his coins. Up to that time, the Moslems had used pieces of their own, and principally used Byzantine and Persian money, thus menacing 'Abd al Malik to institute a purely Arabic coinage. He was a Jew of Tamia, named Sonain, who commenced in this direction. Justinian II. refused to receive these coins in payment of the tribute, and declared the treaty at an end. The renewed Moslems fought valiantly, and succeeded in extending their frontiers to Mar'ash, on the side of Asia Minor, and to Amid, on the side of Armenia. From this time forth the Moslems made yearly expeditions against the Greeks, but they were only razzias, from which the Greeks often avenged themselves by incursions into the territory of Islám.

In Africa we have seen that 'Okba b. Náfi' had been slain by the Berbers, who had taken Kairawán. In the year 73 Abd al Malik sent Hassán b. No'mán into Africa, at the head of a numerous army. He retook Kairawán, swept the coast as far as Carthage, expelling the Greek garrisons from all the fortified places, and then, turning his arms against the Berbers, beat them completely that they submitted for a long time to the tribute and the conscription. But when Hassán left Africa, the Greeks, under the successor of Justinian, retook the coast line. Hassán prepared to return to Africa, but previously demanded from the governor of Egypt, 'Abd al 'Azíz, the recall of a freedman, whom he had appointed governor of a part of the province of Africa. 'Abd al 'Azíz refused, and Hassán went to Damascus to complain to the Caliph. Soon after his arrival at the capital he died, and the governor of Egypt placed Músá b. Nosair at the head of the expedition. This general reconquered the seaboard as far as Carthage, and drove the Greeks permanently from it. The daring Músá continued his triumphant march, and took possession of the whole of the coast to Tlemcen. One of his lieutenants, in the year 82, carried a reconnaissance by sea as far as Sicily. The Moslem fleet having been destroyed by a storm, Músá equipped another, and entrusted its command to his brother 'Abdalláh, who returned to Sicily and effected

razzia there. Merwán, the father of 'Abd al Melik, had designated as successor to the latter his other son, 'Abd al 'Azíz, governor of Egypt. 'Abd al-'Aziz having died in the year 84, 'Abd al-Melik chose as heirs of the empire, first his son Walíd, and after him his second son Solaiman.[1] He himself survived 'Abd al 'Azíz only two years, and died 14th Shawwál 86 (8th October 705), at the age of about sixty. His reign was one of the most important in the annals of Islam, but also one of the most glorious. 'Abd al Melik not only brought triumph to the cause of the Omayyads, but extended and strengthened the Moslem power externally. Amid so many grave anxieties, he yet found time for his pleasures. He was passionately fond of poetry, and his court was crowded with poets, whom he loaded with favours, even if they were Christians, like Akhtal. In his reign flourished also the two celebrated rivals of Akhtal, Jarir and Farazdak.[2]

6. Immediately on his accession Walíd continued Hajjáj in the government of 'Irák, and appointed as governor of Medina his cousin 'Omar b. 'Abd al 'Azíz, who was received there with joy, his piety and gentle character being well known. Under his government important works were undertaken at Medina and Mecca by order of Walíd, who, having no rivals to struggle against, was able to give his attention to pacific occupation. The mosque of Medina was enlarged, wells were found, the streets widened, and hospitals established. At Mecca many improvements were introduced. The reputation of 'Omar attracted to the two Holy Cities a great number of the inhabitants of 'Irák, who were groaning under the iron hand of Hajjáj. The latter, who was not a man to let his prey escape from his grasp, was so much out with Walíd that he obtained the dismissal of 'Omar b. 'Abd al 'Aziz in the year 93, and the appointment of 'Othmán b. Hayyán at Medina, and of Khálid b. 'Abdallah at Mecca. These two prefects compelled the refugees at Mecca and Medina to return to Irák, where many of them were cruelly treated and even put to death by Hajjáj. It was probably his cruelty which drove so many men of 'Irák to enlist in the armies of the East and the South; and this may in some degree account for the unheard-of successes of Kotaiba b. Moslim in Transoxiana, and of Mohammed b. Kásim in India. They may also be explained by the ambition of Hajjáj, who, it is said, cherished the project of creating a vast empire for himself to the east and south of the Moslem realm, and had secretly promised the government of China to the first of his generals who should reach that country. Be this as it may, in the course of a very few years Kotaiba conquered the whole of Bokhara, Khárizm, and Transoxiana or Má wara annahr, as far as the frontier of China. Meanwhile Mohammed b. Kásim invaded Mokrán, Sind, and Multan, carried off an immense booty, and reduced the women and children to slavery. In Armenia and Asia Minor, Maslama, brother of the Caliph Walíd, and his lieutenants, also obtained numerous successes against the Greeks. In Armenia, Maslama even advanced as far as the Caucasus.

The most important achievement, however, of Walíd's reign was the conquest of Spain. The narrative of this conquest belongs specially to the history of Spain, and we shall therefore only touch briefly on it here. We have seen that, even in the Caliphate of 'Abd al Melik, Músá b. Nosair had penetrated as far as Tlemcen in Africa. Under Walíd, Músá, who had been appointed governor of Africa, entered Morocco, occupied Fez and Tangier, and then returned to Kairawán, having made his lieutenant governor of Tangier and of all the West of Africa. town of Ceuta still held out under its governor who held it in the name of Witiza, King of Spain, having been dethroned by Roderic, Julian thought might find the Arabs useful allies in the struggle he proposed to carry on against the usurper, and to negotiations with Tarik. The latter, foreseeing possibility of conquering for the advantage of the country which had been represented to him as a repeated instructions from Musa, who referred the to the Caliph. Walíd gave Mú *carte blanche*, and inclined to make alliance with Julian. He first, sent four ships, with five hundred men under the of Tarif, to reconnoitre the country. This expedition Tarik, now of men, operation to his kindness, passed into Spain himself head of twelve thousand men, in the year 92 (A.D. and landed at the port which the race received the Jabal Tárik, or "Mountain of Tarik," a name which afterwards corrupted by the Westerns into Gibraltar. the news of this invasion, Roderic led a numerous against the Arabs, but was completely routed near and perished in the conflict. Mú jealous success of his lieutenant, hastened to Spain with thousand men, and his first step on arriving was Tarik order to suspend his march. But Tarik, observing, divided his little army into three columns obtained possession successively of Ecija, Malaga, Cordova, and Toledo. Músá, hopeful of arresting victorious march of Tarik, determined to play the a conqueror himself, and took Seville, Carmona, Mérida. On rejoining Tarik at Toledo the first took was to throw him into prison. The Caliph ever, gave orders that he should be set at liberty restored to his command. The two conquerors shared the country between them, and, in less three years, all was subdued, to the very the Pyrenees. Meanwhile Walíd, fearing to declare his independence, recalled him to Damascus, observed after appointing his son 'Abd al 'Aziz Spain, and arriving Seville at his return. Mú Spain in the month of Safar, viz. 95 (October 713), in company with Tarik, bringing immense Damascus, and leading in his train a great number prisoners. His journey from Ceuta to Damascus one long triumph. He reached Egypt in the Rabí I. in the following year (November 714), and marched towards Damascus, where not arrive till two months and a half later, at the moment when Walíd had just breathed his last, brother Solaiman had been saluted as Caliph. renowned Hajjáj had preceded his sovereign, expired five days before the end of Ramadan, Músá did not receive the rewards due to his distinguished services. Accused of peculation by the new Caliph was beaten with rods, and condemned to a fine of pieces of gold, and all his goods were confiscated. Solaiman did not stop here, he caused 'Abd al 'Aziz to Músá, to be put to death in Spain, and cut off his cruelty extended so far as to show his severed head to Músá, him whether he recognised it. He replied that it had often a hundred thousand times appeared to him in ordered his death. Músá died soon after. After there is no further mention of him after the beginning the reign of Solaimán, and we must therefore suppose that he retired into private life.

[1] 'Abd al-Melik had several other sons, two of whom, Yazíd and Hishám, also reigned.

[2] See Caussin de Perceval, *Journal asiatique*, 2e série, vols. xiii. and xiv.

[3] According to Eastern chronicles, Julian's hatred of Roderic from the latter's having dishonoured his daughter.

Sulaimán had nearly missed the throne. Walíd, in
very year of his death, wished to have his son 'Abd
iz b. Walíd chosen as his successor, and had offered
many great sums of money to induce him to surrender
his right to the Caliphate; but Sulaimán obstinately
refused to do so. Walíd went still further, and sent
to the governors of all the provinces, calling on
them to cause the people take the oath of allegiance to
his son. None except Hajjáj and Kuteiba b. Moslim
ever dared to act at once upon the order of succession
signed by 'Abd al Melik, and Sulaimán succeeded
without difficulty at the death of his brother. We can
conceive the hatred felt by Sulaimán for Hajjáj
for all that belonged to him, but once Hajjáj
death, but he soon began
on his family, and chose to melt all that he had
First of all, Mohammed b. Kásim the conqueror
Sind, who was cousin to Hajjáj, was dismissed from
post and outlawed. Hajjáj had deprived Yazíd b.
Muhallab of the government of Khorásán. Sulaimán
vited on him that of 'Irák. Kuteiba b. Moslim, on
the accession of Sulaimán, knew that he was
safe certain, and therefore anticipated the Caliph by
revolt. But Sulaimán ordered Kuteiba's troops to
desert by authorising them to return to their homes, and
when the illustrious general sought to carry his army with
him a conspiracy was formed against him which ended in
murder. Yazíd b. Muhallab, who preferred Khorásán
which obtained permission to exchange. Immediately
after his return to Khorásán he set on foot a scheme of new
conquests against Jurjan and Tabaristán. But the
resistance of Khorásán, which he experienced oppressively,
and complaints against him to the Caliph, accusing him
of numerous extortions in order to obtain such a sum of
money as would enable him to rebel against his sovereign
on that day Sulaimán determined to get rid of Yazíd
However, he was then dreaming of the conquest of
Constantinople, he thought it prudent to dissemble his
dissatisfaction for some time.

The Byzantine empire was disturbed by internal
strife during the years A.D. 715-717. Sulaimán
resolved to take advantage of the circumstance to aid himself
in favor of the hereditary enemy of Islám and prepared a
formidable expedition. A fleet of eighteen hundred
sails, equipped at Alexandria, sailed to the coast of
Asia Minor, took on board the Moslem army, commanded
by Maslama, and transported it to Europe. The army
encamped under the walls of Constantinople, 15th August
A.D. seven months after Leo III. the Isaurian, had ascended
the throne. Once more the Greek fire prevailed against
the Moslem. Their fleet was destroyed by this terrible
engine of war; the army could obtain no fresh supply of
provisions, and suffered all the horrors of famine. Meanwhile
the Caliph, who desired to be present in person at the
taking of Constantinople, had set out to join the
army. He fell ill at Dábik, not far from Aleppo, and died
there on the 25th of September in the same year, after
having nominated as his own successor his cousin, 'Omar
b. 'Abd al 'Azíz, and as successor to the latter, Yazíd b.
Abd al Melik, his own brother. In vain did the new
Caliph despatch from Egypt a fleet of four hundred ships
with army and provisions to the army before Constantinople;
this fleet also was destroyed by the Greeks, and
the Moslem army was decimated by famine, and soon by
the plague as well. A hundred thousand men perished
miserably under the walls of Constantinople, and Maslama
brought back to Asia Minor a mere handful of soldiers,
that with great difficulty.

'Omar b. 'Abd al 'Azíz, incensed at this disaster,
and his revenge on the Christians of his own states by
excluding them from all public employments, in spite of
the great services they rendered there, and by loading
them with imposts to such an extent that one public
functionary wrote thus to the Caliph: "If things continue
to go on in Egypt as at present, all the Christians will
become Moslems to escape taxation, and the State will
lose its revenue." To this the pious 'Omar replied: "I
should look on the conversion of all the Christians as a
great piece of good fortune, for God sent his prophet to
act the part of an apostle, and not of a tax gatherer." By
his rebuke of intolerance, by the simplicity of his life, and
by his zeal in observing the precepts of his religion and
enforcing their observance, 'Omar has acquired in Moslem
history the reputation of a saint. But the sanctity of a
prince is not the greatness of a State, and
reign of 'Omar as we shall see, was injurious rather than
advantageous to Islám. He alienated the provincial
governors by his severity, and the family of 'Abbás took
advantage of the general discontent to stir up the people
secretly, and thus to prepare the way for the fall of the
dynasty.

It will be remembered that Sulaimán died before carrying
out his purpose of deposing Yazíd b. Muhallab, the
governor of Khorásán. 'Omar II. took it on himself to
fulfil the design. He summoned Yazíd to his presence,
and on his arrival at Damascus, threw him into prison,
and demanded the restitution of the money which he
believed him to have misappropriated. As Yazíd alleged
that he had rendered account of it, the Caliph banished
him to Dahlak, a small island in the Red Sea, but soon
brought him back, and placed him in close confinement.
It was not till A.H. 101, when 'Omar II. was dying, that
Yazíd succeeded in escaping and took refuge in 'Irák.
Mokhallad, the son of Yazíd, whom his father, on quitting
Khorásán, had left there as his lieutenant, was also
summoned to Damascus, and the Caliph at first appointed
Jarrah b. 'Abdallah governor of that province, but soon
after on receiving complaints against him, replaced him
by 'Abd al Rahman al Koshairi, whom he desired to use
every effort for the conversion of the unbelievers, rather
than to think of extending the Moslem power by force
of arms. With so pacific a disposition, it is easy to
understand that the Caliph did not signalize his reign by
conquest; except a revolt of the Kharijites in 'Irák,
which was suppressed by Maslama, his caliphate was not
disturbed by any warlike event. Its most noticeable
occurrence, as we have said above, was the commencement
of the 'Abbásid movement.

The 'Abbásid family derived its name from 'Abbás, who
was Mohammed's uncle on the father's side, and who
during the Prophet's life, had enjoyed universal consideration
among the Moslems. It was he who, at the death of
the Prophet had the charge of washing the corpse. The
first Caliph Abúbekr, 'Omar, 'Othmán, and 'Alí, showed
the utmost deference to 'Abbás; and his eldest son
'Abdallah had been united in the closest friendship with
Hasan, the unfortunate son of 'Alí. After the assassination
of 'Alí, and the slaughter of Hosain, 'Abdalláh had
retired to Mecca, and there brought up his numerous
family in hatred of the Omayyads. It was from his
youngest son 'Alí, born A.H. 40, that the 'Abbásid dynasty
proper. Under the Caliph 'Abd al Melik, this 'Alí was
living at Damascus, but, on his marrying Lubbába, the
divorced wife of 'Abd al Melik, the Caliph conceived a
great aversion for 'Alí. Walíd, the son and successor of
'Abd al Melik, inherited his father's prejudices, subjected
'Alí to every kind of insult, and drove him from his court.
Walíd's successor, Sulaimán, gave him leave to return to
Damascus, but 'Alí, instead of availing himself of this
permission, preferred to retire to Homaima, a town situ

ated in the south of Syria, on the confines of Arabia. It was in this retirement that his son Mohammed conceived the design of supplanting the Omayyad dynasty. We have said that the first 'Abbasids were closely united with the family of 'Ali. Mohammed b. 'Ali, the 'Abbasid, saw clearly that it was only among the followers of 'Ali that he was likely to be able to form a party. To attain the object, he formed the plan of making it believed that a descendant of the Prophet's son-in-law had transmitted to him his rights to the Caliphate. It will be remembered that Mohammed b. Hanafiya had come forward as a pretender to the throne at the troublous period when Ibn Zobair and 'Abd al Melik were disputing the Caliphate. According to the story of the 'Abbasids, Abu Hashim 'Abdallah, the son of Ibn Hanafiya, had gone to Homaima to the house of Mohammed b. 'Ali and had made over by deathbed a legal transfer of his rights to Mohammed by appointing him his heir. Whatever may be the truth respecting this transfer, Mohammed the 'Abbasid proabroad the report of it, and chose especially for the propagation the provinces in which the family of 'Ali had the greatest number of adherents, 'Irak and Khorasan. Emissaries sent by him into these two provinces, the caliphate of 'Omar II., began to stir up the people in secret against the reigning house. 'Omar was probably acquainted with these intrigues, but he had not time to repress them, for he died on the 20th or 25th of Rajab A.H. 101 (5th or 10th February 720), after a reign of about two years and a half.

Yazid II. 9. Yazid, the son of 'Abd al Melik, ascended the throne without resistance. His first care was to pursue Yazid b. Mohallab, who had escaped from his prison and taken refuge in 'Irak. Besides reasons of state, Yazid II had personal reasons for ill will to Yazid b. Mohallab. One of the wives of the new Caliph, the one who gave birth to that son of Yazid II who afterwards reigned under the name of Walid II., was niece to the celebrated Hajjáj, who, as it will be remembered, had hated and persecuted Yazid b. Mohallab. Aware of the alliance of the new Caliph with the family of Hajjáj, the son of Mohallab had made every effort to co-operate in his overthrow. He was informed of the illness of 'Omar II., for he well knew that Yazid II. would spare neither him nor his family. In fact, the Caliph sent express orders to the prefect of 'Irak to arrest all the brothers and other members of the family of Mohallab who were to be found at Basra, and this order was immediately carried out. But Yazid b. Mohallab had many partisans in 'Irak. He collected a small army, and fought with such valour that in a short time he succeeded in making himself master of Basra, where he had himself proclaimed Caliph. The public treasury fell into his hands, and he employed it in paying his troops and in raising fresh ones, whom he sent on expeditions into Khúzistán or Ahwáz, Farsistan, Mokran, and Sind. As this revolt threatened to spread far and wide, Yazid II was obliged to have recourse for its suppression to the celebrated Maslama. Early in A.H. 102, this illustrious general took the field, and completely defeated Ibn Mohallab near Basra. Yazid fell in the battle, and his brothers fled beyond the Indus, but were pursued and slain by the lieutenants of Maslama.

This revolt suppressed, Yazid II. was able to give his thoughts to the extension of the empire, an object which had been so much neglected by his predecessor. Several expeditions were directed against Farghana in Trans-oxiana, against the Khazars in Armenia, and against the Greeks in Asia Minor, but without any very decided results. In Africa, serious troubles had been caused by the appointment as governor of a certain Yazid b. Abi Moslim, who had been secretary to Hajjáj, and who followed the example of his master's implacable harshness. The Berbers rose in insurrection, slaughtered the unfortunate governor, and chose in his place Mohammed b. Aus. The Caliph at first ratified the choice but soon after dismissed Mohammed from his post and replaced him by Bishr Safwan, who sent out an expedition against Sicily.

In Europe, the Arabs obtained at this time some decided successes. Under the orders of Samah, their governor in Spain, they crossed the Pyrenees, and took possession of Narbonne; but, having been beaten at Toulouse, they had to retrace their steps. It was the celebrated Abderrahman Abd al Rahman al Ghafeki who effected their retreat.

Yazid II died three years later of a dangerous illness contracted, it was said, by excessive indulgence in the use of wine. On his death-bed he designated as his successor his son Walid. Hisham ascended the throne without opposition.

Hisham was a prudent prince and an enemy of luxury, as is testified by the reformation of 'Omar II. To this severity may in part be attributed the disturbances which broke out in the provinces during his reign. The governors were accustomed to respect loyalty to the Caliph only when the latter did not refrain from the most rigorous exercise of authority on account. Hisham was by nature very avaricious, a fault highly calculated to make him odious to those about him. Lastly, he favoured the Yemenites, and thus alienated from him the powerful party of the Kaisites. All these circumstances combined to favour the Abbasid agents in their propaganda in 'Irak and Khorasan, and succeeded beyond their hopes. The Kaisite tribes, offended at seeing the Caliph bestow the best posts on Yemenites, were ready to espouse with enthusiasm the cause of any one whose aim was the overthrow of the Omayyads. Rebellion had been smouldering in the province for thirteen years, and broke out at last at Cufa and in the whole of 'Irak, under chiefs called Mochtar and Kahtaba, and when these insurgents had been crushed, others sprung up in their place, Abu al Walhoz, Al Ashath, and Al Sakhtayani. The prefect of 'Irak, Khalid b. 'Abdallah, was accused of favouring the revolt, was degraded, and replaced by Yusuf b. 'Omar, who threw him into prison, where he remained for eighteen months. This measure increased the discontent of the people of 'Irak, and a member of the family of 'Ali, Zaid b. 'Ali, collected round him a small body of partisans, and had himself proclaimed Caliph, A.H. [illegible] (A.D. 739-740). Unfortunately for Zaid, he had to do with the same Cufans whose fickleness had already been fatal to his family. At the moment of danger he was deserted by his troops, fought an unequal conflict, and fell dead at the feet of Hisham's horse.

In Khorasan also there were very serious disturbances. In the year 106 (A.D. 724-725), there had already been a revolt at Balkh excited by the emissaries of the 'Abbasids. The following years brought with them fresh troubles which led to the dismissal of the governor of Khorasan, Asad, the brother of Khalid b. 'Abdallah, who had been prefect of 'Irak. Under the successors of Asad, who were successively Nasr b. 'Abdallah, Joneid, 'Abd al-Rahman, and 'Asim b. 'Abdallah, seditions broke out in Transoxiana, which were repressed with great difficulty, and it was not until the year 120 that, by the appointment of the brave and prudent Nasr b. Sayyar as governor of Khorasan, peace was for a time restored to that region. The 'Abbasid emissaries, nevertheless, secretly continued their propaganda.

In India, several provinces which had been convert

The 'Abbásid Caliph Ma'mún certainly did not believe in it, for he thought it his duty to restore the Caliphate to the family of 'Ali, by appointing as his successor 'Alí Ridá, a descendant of the Caliph 'Ali.

to Islam under the Caliphate of 'Omar II. declared themselves independent and this led to the founding of several strong cities for the purpose of controlling those provinces. It was thus that the cities of Mahdíza and Mansúra had their origin.

In the north and north-west of the empire there were no internal disorders, but the Moslems had much to do to maintain themselves there against the Alans, the Turkomans, and the Khazars. The illustrious Maslama lost his life in battle, and Merwán b. Mohammed, afterwards Caliph, took his place as prefect of Armenia and Azerbaijan. He succeeded in imposing peace on the petty princes of the Eastern Caucasus, and in consolidating the Arab power in that quarter. The war against the Byzantines lasted during the whole of Hishám's reign. In Asia Minor, the Moslems reoccupied Cæsarea, and laid siege to Sicca. Arab writers even declare that Constantine, afterwards Emperor of Constantinople, was made prisoner in the year 111 (A.D. 729/730), but the Byzantine authorities make no mention of this fact. On the other hand, they notice an important defeat of the Moslem arms in A.D. 739. This defeat, which is acknowledged by the Arab writers, cost the life of their general, 'Abdallah surnamed al Battál "the hero" whose prowess still lives in the memory of the people of Asia Minor.

In Africa, several successive prefects were fully occupied to repress the constant insurrections of the Berbers. In Spain, the attention of the Moslems was principally turned to avenging their defeat beyond the Pyrenees. As early as the second year of the reign of Hishám, Anbasa, governor of Spain, crossed the Pyrenees and pushed on military operations vigorously. Carcassonne and Nismes were taken. The death of 'Anbasa, in A.H. 107 (A.D. 725/726), put a stop to hostilities, but they recommenced still more vigorously six years later. 'Abd al-Rahman (Abderame) the same who, under Yazíd II., had led back to Spain the remnants of the Moslem army, crossed the mountains anew, and penetrated into Gascony by the passage of Roncevaux. The Moslems beat the Duke Eudes, gained possession of Bordeaux, and overran the whole of Southern Gaul as far as the Loire. But in A.H. 114 (A.D. 732) Charles Martel, whose aid the Duke of Aquitaine had implored, succeeded in intercepting 'Abd al-Rahman at [illegible], near Poitiers, but the Moslems were obliged to effect a hasty retreat, and to return to Spain. Two years later the new governor of Spain, 'Okba b. al Hajjáj, re-entered Gaul, and pushed forward expeditions as far as Burgundy and Dauphiné. Charles Martel, with the help of the Lombards, again drove back the Arabs as far as Narbonne. Thenceforth the continual revolts of the Berbers in Africa on the one hand, and on the other the internal troubles which disturbed Spain and which led at a later period to its independence, offered insurmountable obstacles to the ambition of the Moslems and prevented them resuming the offensive.

Such was the state of the empire when Hishám died on the 6th of Rabí' II. A.H. 125 (6th Feb. A.D. 743), after a reign of twenty years. He had not been a great man either in energy and ability. Yet under his reign the Moslem power declined rather than advanced, and signs of the decay of the Omayyad dynasty began to show themselves. The history of his four successors, Walíd II., Yazíd III., Ibráhím, and Merwán II., is but the history of the fall of the Omayyads.

11. Walíd II., the son of Yazíd II., ascended the throne without opposition at the death of Hishám; but he soon made himself so much hated and despised by his debaucheries and his irreligion that even the sons of Hishám and of Walíd I. plotted with the enemies of the Omayyads. Yazíd, one of the sons of Walíd I., went so far as to take openly the title of Caliph, and to march against Damascus which Walíd II. had quitted for fear of a pestilence which was then raging there. This step was fatal to the Caliph. The inhabitants of Damascus opened their gates to Yazíd who took possession of the arsenals, and used the arms they contained to equip new troops. Walíd II., on his side, collected his adherents and marched against his rival. The two armies met at a place called Bakhrá, on the confines of Syria and Arabia. Yazíd had no difficulty in overcoming his opponent, who was abandoned by his own soldiers. Walíd II. died fighting, having reigned little more than a year, and his head was taken to Damascus and carried about the city at the end of a spear. (Jomád II., A.H. 126, March-April 744.)

12. The death of Walíd II., far from appeasing the troubles of the State, put its unity in greater jeopardy than ever. The distant provinces escaped from the power of the new Caliph. In Africa, 'Abd al Rahmán b. Habíb declared himself independent. In Spain, every emir aspired to free himself from a suzerainty which appeared to him only nominal. In Khorasan the 'Abbásid emissaries were more and more busy, acting in the name of Ibráhím b. Mohammed, who had become the head of the family by the death of his father, Mohammed b. 'Alí. Even in Syria Yazíd III. saw his authority disputed. Himself belonging to the sect of Mo'tazilites, who rejected the doctrine of predestination—a sect to which we shall have occasion to return in treating of the religious history of Islam—he aroused all the orthodox against him. Besides this many of the Syrians, from a sudden change of feeling, now decreed to avenge the death of Walíd II. The inhabitants of Emesa revolted, and marched against Damascus. They were beaten at a place called Thanfya al Okab, or The Eagle's Pass, twelve miles from the capital. Palestine rose in its turn, and chose as its Caliph another Yazíd, cousin of the reigning prince. This revolt also was suppressed. But a greater danger menaced Yazíd III. The Omayyad Merwán b. Mohammed, who was, as we have said, governor of Armenia and of Azerbaijan, also prepared to dispute the supreme power with the Caliph of Damascus, and invaded Mesopotamia. Yazíd III., in his alarm, offered him the government of this last province as the price of peace. Merwán accepted these conditions, but he would probably not have left his rival long at rest, had not the latter died after a reign of only six months.

13. Yazíd III. left his brother Ibráhím as his successor. At the news of Yazíd's death, Merwán collected a powerful army and entered Syria. Having beaten Ibráhím's generals one after the other and taken Emesa, he advanced rapidly towards Damascus. Solaimán b. Hishám tried to oppose his march, but he was defeated at 'Ain al-Jar between Baalbec and Damascus, and the Caliph Ibráhím took flight, while Solaimán, the son of Hishám, laid hands on the public treasure, and then fled in turn. Merwán entered Damascus, and caused himself to be proclaimed Caliph. The reign of Ibráhím had lasted only two months. Ibrahim himself soon acknowledged the new Caliph, and submitted to his authority.

14. Merwan II. was a man of energy, and might have preserved the strength of his dynasty, if the ferment in the east of the empire had been less strong. Unfortunately for him, the 'Abbásid movement had never ceased to gain ground in Khorásán, and the chief adherent of the family of 'Abbas, Abú Moslim, was in no degree inferior to the Caliph in energy and ability. This Abú Moslim, whose origin is obscure and disputed, had been distinguished by the 'Abbásid Mohammed b. 'Alí, the same who alleged that he had been appointed heir to the claims of the family of 'Alí to the supreme power. If we may believe the legend

Mohammed had even foretold that the accession of his family would take place *in the year of the ass*,[1] through the efforts of Abú Moslim, and that one of his three sons would ascend the thro These three sons were: Ibrá him, 'Abdalláh, called Abú 'l-'Abbás, and 'Abdalláh, called Abú Ja'far. Whatever we may think of this prediction, it is certain that under Merwán II. Abú Moslim was the principal emissary of the 'Abbásid Ibráhím, and had been able to form a vast conspiracy in Khorasan, which broke out in A.H. 128, at the very moment when it had been discovered by Nasr b. Sayyár, the Omayyad governor of the province. Even before this, Merwán II. had had to suppress disorders which had broken out in Syria, Palestine, and 'Iráḳ; and the Caliph could now rely so little on Syria that he had thought it necessary to quit Damascus, and to fix his abode at Harrán, in Mesopotamia. On learning the revolt of Abú Moslim, Merwán II. wrote to Nasr b. Sayyár, directing him to act with vigour against the fomenters of sedition. It was easier to give such an order than to execute it, for Abu Moslim was at the head of a numerous army, absolutely devoted to the 'Abbásids. Merwán II. thought it necessary at the same time to secure the person of the 'Abbásid pretender Ibrahim, who was still living at Homaima. Ibrahim was therefore arrested, conveyed to Harran, and thrown into prison. He found means, however, of communicating with his lieutenant Abu Moslim, and the latter, who had received the most extensive powers from his chief, marched direct upon Merv, the capital of Khorásan, and drove out the governor Nasr. At the news of [illegible] Caliph, no longer able to restrain his anger, had his captive Ibrahim put to death; an execution which, at a later period, brought upon the Omayyads the most terrible reprisals. The brother of Ibráhím, Abú 'l-'Abbás, surnamed Saffáh, "The Sanguinary," on account of his cruelties by Ibráhím's death became chief of the 'Abbásids, immediately quitted Homaima with all the members of his family, and took refuge in Khorasan that his presence there might sanction and encourage the insurrection. Abú Moslim, now master of Khorasán by the capture of Merv, had meanwhile sent an army against 'Iráḳ, under the orders of Kahtaba b. Shabib, who had beaten the Omayyad army, commanded by Yazíd b. Hobaira, governor of that province. In A.H. 132 Abú 'l-'Abbás arrived at Merv. After remaining there some time, waiting for a favourable moment, he decided on openly assuming the title of Caliph. He installed himself in the governor's palace, and thence went in state to the mosque, where he mounted the pulpit, and officiated in the capacity of successor of the Prophet. All those present took the oath of allegiance to him, and Abú 'l-'Abbás returned to the palace, over which the black flag was flying, black being the distinctive colour of the 'Abbásids.[2] But he did not remain long at Merv. Committing the government of that city to his uncle Dáwúd, he went to review his army, and divided it into several corps, which he directed against different points. After this he went to Chaldæa, and there established himself in a spot not far from Cufa, to which he gave the name of Hashimiya, or the city of Hashim, the ancestor of his own family and of that of the Prophet. Another of his uncles, 'Abdallah b. 'Ali, whom he had sent on an expedition against the city of Shahrozur, took possession of that place, and leaving Abu 'Aun 'Abd al Melik b. Yazíd there as governor, rejoined his nephew and sovereign at Hashimiya. Meanwhile the Omayyad Caliph had marched against Shahrozur. Abu 'Aun went out to meet him, and was joined by a strong reinforcement of cavalry under 'Abdallah b. 'Ali. The 'Abbásids only numbered forty five thousand soldiers, but these were experienced and resolute warriors. The Omayyad army, though much more numerous, was ill commanded and devoid of spirit. A battle ensued, and fortune favoured the rebels. In vain did Merwan show himself everywhere, his soldiers gave way and repassed the Zab in disorder, hurrying away in their flight the unfortunate Merwán. (Jomadi II. 132, A.H. 25th January 750.) This victory cost the Omayyads their empire. Merwan attempted at first to take refuge at Mosul; but the inhabitants of that city having declared for the enemy, the prince went to his capital Harrán, whence he was driven by the army of 'Abdallah b. 'Ali. Merv successively to Emesa to Damascus, to Palestine, and finally to Egypt. He was pursued without intermission by Sálih, brother of 'Abdallah b. 'Ali, who at last came up with him at Búsir on the frontiers of the Delta. Merwán took refuge in a Coptic church; but the 'Abbásids pursued him into the building, and slew him at the foot of the altar. His head was cut off and sent to Cufa, where the new Caliph then

Thus perished in the East the dynasty of the house of Omayya, which, having been founded by usurpation, had only maintained itself by shedding torrents of blood, and was destined to perish in blood. We now enter upon the history of the new dynasty, whose origin we have described, and under which the power and glory of Islam reached their highest point.

Here we give the

12. YAZÍD III. 13. IBRÁHÍM.

[1] To understand this allusion we must know that Merwan II. had received the nickname of *Himár*, "the ass," on account of his temperance and the strength of his constitution.

[2] Historians are divided as to the date at which black became the Abbásid colour. According to some, the first 'Abbásids wore a robe of black silk as early as at the battle called that of the Camel. According to others, it was only after the murder of Ibrahim by Merwan that the Abbásids adopted black as a sign of mourning. See Quatremère, *Mémoires historiques sur la dynastie des Khalifes Abbassides*. Paris, 1837.

Sect. II.—The 'Abbásids.

1. From the death of Merwán may be reckoned the real accession of the 'Abbasid dynasty to the Caliphate, which thus returned to the hands of the grand nephews of the Prophet. Abu 'l-'Abbás, whose proper name was Abdallah, and who afterwards received the surname of Saffah, was, as has been said above, a man of energetic will, who hesitated at nothing to ensure the triumph of his dynasty. When he caused himself to be proclaimed Caliph at Cufa, one of his partisans, Abú Salama, who had still then believed that Abú 'l-'Abbas was working to restore the posterity of 'Ali to the throne, and not to gain possession of the empire for himself, hesitated to take the oath of obedience to the new Caliph. Abu 'l-'Abbas immediately resolved on his destruction, but fearing that Abu Salama might have a secret understanding with the governor of Khorasan, he began by sending his own brother Abú Ja'far into that province to sound Abu Moslim. The latter loudly disclaimed any alliance with Abu Salama, and, that no suspicion might rest upon him, he sent a confidential agent to Cufa, and had Abú Salama assassinated. Still further to prove his zeal for the house of 'Abbas, Abu Moslim also got rid of Solaiman b. Kathir, another 'Abbasid emissary, whom he suspected of partiality towards the family of 'Ali. On his side, Abu 'l-'Abbas caused 'Abdallah b. Mo'awiya, an adherent of 'Ali's family, to be treacherously slain, though he had distinguished himself in the war against Merwan. As for the Omayyads, they were systematically followed up and put to death. The new Caliph desired to exterminate that family, not only for the sake of revenge, but also that he might deprive the Syrians of any pretext for fresh insurrections. In fact, hardly had Abu 'l-'Abbas been proclaimed Caliph at Cufa, when the Omayyad governor of Kinnesrin, Abú 'l-Ward b. Kauthar, notwithstanding that he had taken the oath to the new sovereign, gave the signal for revolt in the name of the Omayyads. Abu 'l-'Abbas immediately ordered his uncle 'Abdallah b. 'Ali, who had been made governor of Palestine, to act with the utmost rigour against all members of the Omayyad family on whom he could lay his hands. That he might let none of them escape, 'Abdallah pretended to grant an amnesty to all Omayyads who should come in and acknowledge the new Caliph, and even promised them the restitution of all their property. Ninety members of that unfortunate family allowed themselves to be entrapped by these specious promises, and 'Abdallah, on pretence of sealing the reconciliation of the two parties, invited them to a banquet. But when they were all collected, a body of executioners rushed into the hall, and slew the Omayyad with blows from whips and rods. A grandson of Hishám 'Abd al-Rahman b. Mo'awiya, who had taken refuge in Africa, alone escaped this massacre. It was he who, at a later date, founded in Spain the Omayyad dynasty of Cordova. The cruelty of the 'Abbasids excited a feeling of horror in the whole of Syria, and the revolt soon became general. Abú 'l-Ward b. Kauthar found himself at the head of forty thousand men, and pitched his camp at Marj al-Akhram, a plain near Kinnesrin. The revolt spread even to Mesopotamia and 'Irak. One of Merwan's former generals, Ishák b. Moslim, laid siege to Harrán, while Yazid b. Hobaira, formerly governor of 'Irák, raised an insurrection at Wásit. In Khorásán also, as many as thirty thousand malcontents took up arms against Abú Moslim. Notwithstanding this formidable display of force, the 'Abbasids remained conquerors. In Syria, 'Abdallah b. 'Ali beat Abú 'l-Ward at Marj al-Akhram. Abú Ja'far, brother of the Caliph, compelled Ishák b. Moslim and Yazid b. Hobaira in succession to submit. Lastly, Abú Moslim quieted the rising in Khorasán. Mosul also attempted an insurrection, but Yahyá, a brother of the Caliph, quenched the revolt in streams of blood. All the provinces being thus reduced to peace, the new Caliph distributed them among the principal members of his family and his best generals. To his brother Abú Ja'far he gave a part of Mesopotamia, Azerbaijan, and Armenia; to his uncle 'Abdallah b. 'Ali Syria; to his uncle Dawúd, Arabia, Hijáz, Yamán and Yemen, to his cousin 'Isá b. Músá, the province of Cufa. Abú Moslim continued in possession of the government of Khorasan, Transoxiana, and a part of Fársistán. Egypt was entrusted to Abú 'Aun. Another uncle of the Caliph, Solaiman b. 'Ali, received the government of Basra, with Bahrain and 'Oman. Lastly, the province of Mosul was taken from the cruel Yahya, and granted to one of the uncles of Abú 'l-'Abbás, Ismá'íl b. 'Ali, who received besides the government of Ahwáz. In Sind, the Omayyad governor had succeeded in maintaining himself, but was defeated by an army sent against him under Musa b. Ka'b, and the black standard of the 'Abbásids was raised over the city of Mansúra. If we omit Africa and Spain in describing this division of the provinces of the empire, it is because the 'Abbásids never gained a real footing in Spain, while Africa remained in only nominal subjection to the new dynasty.

Abu 'l-'Abbas, after having definitively established his power, left the town of Hashimiya and fixed his residence at Anbar, where he died on the 13th of Dhú 'l-Hijja, A.H. 136 (9th June 754).

2. Abu 'l-'Abbas had designated as his successors, first Abu Ja'far, and after him his cousin 'Isá b. Músá. At the moment of the death of Abú 'l-'Abbás, Abú Ja'far, who then assumed the title of Al-Mansúr, "the Victorious," was not in 'Irak. He had undertaken the leadership of the pilgrims who had started on the journey to Mecca, and among whom figured the celebrated Abu Moslim. 'Abdallah b. 'Ali, uncle of Abú 'l-'Abbás, dissatisfied at having been excluded from the succession, took advantage of this absence to revolt. Having raised an army and proclaimed himself Caliph, he marched against Harran and laid siege to it. On receiving the news, Abú Ja'far hastened to return to Anbár in company with Abu Moslim, whom he placed at the head of his troops, and sent against the rebel. At the approach of Abú Moslim, 'Abdalláh, who had among his troops a body of seventeen thousand men of Khorásán, feared that they might declare for Abú Moslim, had them all slaughtered, as the historians assert, by his Syrians, and then hastened to meet his enemy. The two armies met at Nisibis, and, after a number of skirmishes, a decisive engagement took place on the 7th of Jomádí II., A.H. 137 (28th November 754). 'Abdalláh was defeated and compelled to submit to Al Mansúr, who spared his life. The new and brilliant service thus rendered by Abú Moslim to his sovereign ought to have placed him even higher in the favour of Mansúr than he already stood. On the contrary, it was the cause of his ruin. The Caliph wished to commit the task of maintaining order in Syria to Abú Moslim, but the latter refused to give up his government of Khorásan, where he enjoyed an extraordinary reputation and possessed numerous adherents, and, instead of obeying the order of the Caliph, directed his march towards the East. Thenceforth Mansúr looked on him only as a dangerous rebel, and sought for means of getting rid of him. On pretence of conferring with him on business of state, he induced him to come to Madáin (the ancient Ctesiphon), caused him to be put to death by his guards, and ordered his body to be thrown into the Tigris. Thus miserably perished the real founder of the 'Abbási

ynasty, after having accomplished his work, which, as
e historians assert, cost the lives of more than 600,000
en. Notwithstanding the defeat of 'Abdallah b. 'Alí
d the murder of Abú Moslim, the spirit of rebellion was
t yet broken. Risings took place in Mesopotamia and
a still greater extent in Khorásán; and the Caliph's
oops were repeatedly beaten by the rebels; but order
as at last re established by Mansúr's generals, by Khazim
Khozaima in Mesopotamia, and by Mohammed b. al
sh'ath in Khorásán.

About the same time Africa and Spain escaped from
e dominion of the Eastern Caliphate, the former for a
eason, the latter permanently. The cause of the revolt
f Africa was as follows: As soon as Mansúr ascended the
rone, he wrote to 'Abd al-Rahman, announcing the
eath of Abú 'l 'Abbás, and requiring him to take the
th of allegiance. 'Abd al-Rahmán sent in his adhesion
the new Caliph, and added a few p[illegible]ts of litt
he Caliph was so much dissatisfied that he replied by a
reatening letter which excited the anger of 'Abd al
ahmán. He called the people together at the hour of
rayer, mounted the pulpit, publicly cursed Mansúr, and
en declared his deposition from the Caliphate. He next
used a circular letter to be written, commanding all
Maghrebins to refuse obedience to the Caliph; and this
tter was circulated and read from the pulpit throughout
e whole extent of the Maghrib (the West). A brother of
bd al-Rahmán, Ilyas, saw in this revolt an opportunity of
taining the government of Africa for himself. Seconded
y many of the inhabitants of Kairawan, who had
emained faithful to the cause of the 'Abbásids, he attacked
is brother, slew him, and proclaimed himself governor in
is stead. This revolution in favour of the 'Abbásids was,
owever, of no long duration. Habíb, the eldest son of
bd al Rahmán, had fled on the night of his father's
urder, and Ilyás caused him to be pursued, with the
bject of transporting him to Andalusia. Habíb was
aptured, but the vessel which was to convey him to Spain
aving been detained in port by stress of weather, the
artisans of independence took arms, rescued Habíb, and
repared to resist Ilyás, who was marching against them
t the head of an army. Under these circumstances a
ortunate idea occurred to Habíb. He challenged his
ncle Ilyás to single combat. Ilyás hesitated, but his
wn soldiers compelled him to accept the challenge. He
easured arms with Habíb, and was laid prostrate by
im with a thrust of his lance. The party of independ
nce thus triumphed, and several years elapsed before the
Abbásid general, Al-Aghlab, was able to enter Kairawan,
nd regain possession of Africa in the name of the Eastern
Caliph. From this time forward, it must be added, Africa
nly nominally belonged to the 'Abbásids; for, under the
Caliphate of Hárún al-Rashíd, Ibrahim, the son of Al
Aghlab, who was invested with the government of Africa,
ounded in that province a distinct dynasty, that of the
Aghlabites.

Coincidently with the revolt in Africa, the independent
Caliphate of the Western Omayyads was founded in Spain.
The long dissensions which had preceded the fall of that
ynasty in the East, had already prepared the way for the
ndependence of a province so distant from the centre
f the empire. Every petty [illegible] there tried to seize
overeign power for himself, and the people groaned under
he consequent anarchy. Weary of these commotions, the
Arabs of Spain at last came to an understanding among
hemselves for the election of a Caliph, and their choice fell
pon the last survivor of the Omayyads, 'Abd al-Rahman
. Mo'áwiya, grandson of the Caliph Hishám. This
rince was wandering in the deserts of Africa, pursued
y his implacable enemies, but everywhere protected and
concealed by the desert tribes, who pitied his misfortunes
and respected his illustrious origin. A deputation from
Andalusia sought him out in Africa, and offered him the
Caliphate of Spain, which he accepted with joy. On 25th
September, A.D. 755, 'Abd al Rahmán landed in the Iberian
Peninsula, where he was universally welcomed, and
speedily founded at Cordova the Western Omayyad Caliph
ate, with which this history has no further concern.

While Mansúr was thus losing Africa and Spain, he was
trying to take from the Greeks the city of Malatiya,
which, from the importance of its situation, was looked
on as the key of Asia Minor. In A.H. 139-140 (A.D. 756-
757), a Moslem army of 70,000 men invested the place,
and, after a vigorous siege, Malatiya was taken by
assault. After this success the Moslems marched through
Cilicia, entered Pamphylia, and cut to pieces a Greek
army on the banks of the Melas. The Greeks asked and
obtained a seven years' truce, which Mansúr was the more
disposed to grant because new and very serious troubles
had been stirred up in his empire by certain sectaries
of Khorásán, called Rawándís. These Rawándís, like
other Persian sectaries, admitted a number of
doctrines completely foreign to Islam, such as the trans-
migration of souls and the incarnation of the Deity as a
man. They believed for instance, as historians assert
it, that divine honours ought to be paid to the Caliph
Mansúr. They had their name from Rawand, a city
near Isfahán, where the sect originated. A great number
of these sectaries had repaired to Hashimiya, the residence
of the Caliph, and there persisted in marching in pro-
cession round his palace, as if it had been the Ka'ba.
Mansúr, refusing to receive this impious homage, caused
the principal chiefs of the sect to be seized and thrown
into prison. The Rawándís immediately [illegible] in revolt,
broke open the prison doors, rescued their chiefs, and
pushed their audacity so far as to besiege the Caliph
in his own palace. Very fortunately for Mansúr, the
populace declared against the Rawándís and massacred
them; but from that time forward he took a dislike to
the city of Hashimiya, and resolved to choose another
residence. He had at first thought of fixing his place of
abode at Cufa; but he remembered the fickle character of
the inhabitants, and decided on founding an entirely new
city on the banks of the Tigris. His choice fell upon
a spot near the ancient Ctesiphon, the capital of the
Sassanids, called Baghdad. There he himself laid the
first stone of the city which was to be the centre of the
civilised world as long as the Caliphate lasted. A revolt,
however, of some importance soon called Mansúr's atten-
tion from the building of Baghdad. The descendants of
'Alí, who had had reason to [illegible] that the 'Abbásids
were labouring for their advancement, were now cruelly un-
deceived. In A.H. 145 (A.D. 762-763), Mohammed Mahdí,
great grandson of Hasan, and surnamed Al Nafs al Zakiya
("the pure soul"), collected a large number of adherents
at Medina, and had himself proclaimed Caliph. The
governor of Cufa, 'Isa b. Músá, received orders to march
against him, and entered Arabia. The partisans of 'Alí
were defeated, and Mohammed Mahdí fell in battle. But
meanwhile his brother Ibrahim had gone to Basra, and
had there succeeded in exciting a revolt, in presence of
which the 'Abbásid governor had been obliged to capitu-
late. The adherents of 'Alí, emboldened by this success,
spread themselves over 'Iraq, and obtained possession of
several places, among which was the city of Wasit.
Ibrahim was already advancing towards Cufa, at the
head of a strong army, when 'Isa b. Músá, who had been
hastily recalled from Arabia, threw himself in his way.
A terrible conflict took place. At last Ibrahim fell,
pierced by an arrow, and, in spite of the desperate effort

x followers, his body remained in the hands of the
y. The partisans of 'Alí then dispersed, and never
ventured to have recourse to arms.

e Caliph was highly delighted when he heard of the
ive victory gained by 'Isá, but, far from rewarding
ilant conduct, he tried to compel him to renounce his
of succession to the Caliphate, with the view of
itut ng as heir pre umptive his own son Mohammed.
t first energetically refused to abandon his rights;
Ja'far did not hesitate at a shameless deception, and
ced false witnesses, who swore that 'Isa had waived
im in favour of Mohammed b. Mansúr. However
ingly, 'Isá was obliged to yield his priority to
mmed, but it was understood that, in case of the
of the latter, the succession should return to 'Isa
of the false witnesses was, it is asserted, Khálid b.
ak, the head of that celebrated Persian family the
endes, which played so important a part in the reign
arún al Rashíd. To this Khálid, Mansúr had
sted the elevated post of minister of finance.

A.H. 158 (A.D. 774-775), Mansúr, feeling the decline
powers, resolved to undertake for the last time the
nage to Mecca. At the last station on the route he
fell from his horse, and died at the gate of the Holy
He was nearly seventy years of age, and had
d for twenty two years. He was buried at Mecca.

Mohammed b. Mansúr was at Baghdád when he
ed the news of his father's death, and hastened to
himself proclaimed Caliph. He then took the title
ahdí ("the well directed"). To make his accession
me to his subjects, he began by granting an amnesty
reat number of persons who had incurred the anger
ansúr, and had been thrown into prison. Among
was a certain Dáwúd b. Ya'kúb, whom Mahdí after
made his prime minister. But, on the other hand,
did not choose to confirm in their posts the pro
l governors in whom his father had placed confidence;
pplied their places by creatures of his own. These
es displeased the people of Khorásán, who revolted
the leadership of a certain Yúnus b. Ibrahím, sur

veils which covered the exterior walls of the Ka'ba.
very long time these veils had been placed one over
er, no care having been taken to remove the old
ing when a new one was put on; so that the accumu-
weight caused uneasiness respecting the stability of
alls. Mahdí caused the temple to be entirely stripped,
covered the walls again with a single veil of great
ss. On this occasion he distributed considerable
sses among the Meccans. From Mecca, Mahdí went
edina, where he caused the mosque to be enlarged.
ng his stay in that city he formed himself a guard
nour, composed of two hundred descendants of the
s,[1] to whom he assigned lands in 'Iráḳ to be held in
fief. Struck by the difficulties of every kind which
to be encountered by poor pilgrims who desired to
to Mecca from Baghdád and its neighbourhood, he re
to come to their help. His first care was to have the
from Baghdád to Mecca laid out, and its divisions m
by milestones. He next ordered the construction at
stage of a kind of inn, where the poorer travellers
find shelter and food. He also saw to having new
dug and cisterns built along the whole route.

Whilst he was devoting himself to these pious la

pitched his camp on the shores of the Bosphorus. Irene took alarm, sued for peace, and obtained it, but on humiliating conditions. This brilliant success increased Mahdí's affection for Hárún to such an extent that he resolved, a few years later, to declare him his successor instead of Músá. It was necessary first to obtain from Músá a renunciation of his rights; and for this purpose his father recalled him from Jorján, where he was then engaged on an expedition against the rebels of Tabaristan. Músá, who had had information of his father's intentions, refused to obey this order. Mahdí determined to a in person against his rebellious son (A.H. 169), and set out, accompanied by Hárún. But, after his arrival at Másabadhán, a place in Persian 'Iráḳ or Jabal, the Caliph died suddenly, at the age of only forty three. There are two versions of the cause of his death, some attributing it to an accident met with in hunting, others believe him to have been poisoned. If this was really the case, although we have no proofs against Músa, we may reasonably suspect him of having been privy to the sudden death of his father.

4. Mahdí having died before he could carry out his plan for assuring the throne to Hárún, the succession naturally fell to Músá, and he was proclaimed Caliph at Baghdad in the year of his father's death. He took the title of Hádí (He who directs). Hárún made no opposition to the accession of his brother, and the army which had accompanied Mahdí returned peacefully from Jabal to Baghdad.

The accession of a new Caliph doubtless appeared to the partisans of the house of 'Alí a favourable opportunity for a rising. Hosain b. 'Alí, a descendant of that Hasan who had formerly renounced his pretensions to the Caliphate through fear of Mo'áwiya I., raised an insurrection at Medina with the support of numerous adherents, and had himself proclaimed Caliph. But having unfortunately conceived the idea of going on pilgrimage to Mecca, he was attacked at Fakh by a party of 'Abbásids, and perished in the combat. His cousin Idrís b. 'Abdallah succeeded in escaping and fled to Egypt, whence he passed into Morocco; and there, at a later period, his son founded the Idrísite dynasty.

Hádí, as may be supposed, had never been able to forget that he had narrowly escaped being supplanted by his brother. He formed a plan for excluding Hárún from the Caliphate, and transmitting the succession to his own son Ja'far. He neglected no possible means of attaining this object, and obtained the assent of his ministers, and of the principal chiefs of his army, who took the oath of allegiance to Ja'far. Only Yahyá b. Khálid the Barmecide, Hárún's former tutor, absolutely refused to betray the interests of his pupil. In a discussion which took place between him and the Caliph on this subject, Yahya showed such firmness and boldness that Hádí resolved on his death, and Harthama b. A'yan, one of the bravest generals of the empire, had already received the order to go and take his head, when the Caliph died suddenly. One of those terrible domestic dramas had been acted of which so many were afterwards seen in the palace of the Caliphs. The mother of Hádí and Hárún was Khaizorán, a haughty and intriguing woman, whose aim it was to get the direction of affairs into her own hands, leaving Hádí only the shadow of power. Her influence over all matters of government was so well understood that her door was beset all day by a crowd of petitioners, who neglected the Caliph and preferred to address their requests to her. Hadí soon became indignant at the subordinate part which his mother wished him to play, and after a dispute on the matter, he attempted to poison her. Khaizorán, hoping to find a more submissive instrument of her will in her second son, and wishing to protect herself against fresh attempts at murder, caused Hádí to be taken unawares and smothered with cushions by two young slaves whom she had presented to him. (Rabí' I., A.H. 170, Sept. A.D. 786.)

5. We have now reached the most celebrated name among the Arabian Caliphs, celebrated not only in the East, but in the West as well, where the stories of the Thousand and One Nights have made us familiar with that world which the narrators have been pleased to represent to us in such brilliant colours.

On the unexpected death of Hádí, the generals and ministers who had declared against Hárún, perceiving that popular favour did not incline to the son of the late Caliph, hastened to rally round the son of Khaizorán and Hárún, surnamed Al Rashíd (The Upright), ascended the throne without opposition. His first act was to choose as prime minister his former tutor, the faithful Yahyá the Khálid, and to confide important posts to the two sons of Yahya, Fadl and Ja'far, the former of whom was also his own foster brother. The Barmecide family were endued in the highest degree with those qualities of generosity and liberality which the Arabs prized so highly. The chroniclers are never wearied in their praises of the Barmecides. Loaded with all the burdens of government Yahyá brought the most distinguished abilities to the exercise of his office. He put the frontiers in a state of defence, and supplied all that was wanting for the security. He filled the public treasury, and carried the splendour of the throne to the highest point. The following anecdote will show what an amount of confidence and affection the Barmecide family succeeded in winning.—

After Hárún, as we shall relate further on, had ruined the Barmecides, of whose influence he was jealous, he forbade the people to impose elegies on the disgrace of the family and commanded that all who disobeyed this order should be punished. One day [illegible] of the Caliph's guard was passing near a ruined building, he perceived a mare bearing a paper in his hand and reciting aloud, and with many tears, a lament over the ruin of the palace of the Barmecides. The soldier arrested the man and led him to the palace of the Caliph, who ordered the culprit to be brought before him and asked him why he had infringed his orders. "Prince," replied the man, "let me recount to you my history, when thou hast heard it do with me as thou wilt. I was an inferior clerk, under Yahya b. Khálid. He said to me one day, 'Thou must invite me to [illegible].' 'My lord,' I replied, 'I am quite unworthy of such [illegible], and my house is not fit to receive thee.' 'No,' said Yahya, 'thou must absolutely do what I require of thee.' 'In that case,' answered I, 'grant me one hour's delay that I may make [illegible] arrangements.' Yahya started for some months. A[illegible] as I informed him that I was ready, he returned to my abode accompanied by his two sons, Fadl and Ja'far, and by some of his men. Scarcely had he dismounted from his horse when I [illegible] seemed to give him something to eat. I offered him some [illegible] chicken. When he had eaten his fill he went over the whole of my [illegible] and having seen it all, he asked me to show him the [illegible]. I replied to it, 'My lord,' said I, 'thou hast seen everything. No,' said he, 'I must have another house.' I then assured him that I had but one, but he persisted [illegible] and sending for a waggon, ordered him to make an opening in the wall. 'My lord,' said I, 'must I venture thus to make my way into my neighbour's house?' 'It matters not,' replied he. Where a doorway had been opened we passed through it, followed by his two sons, and I went after them. We entered a delightful garden, well planted and watered by fountains. In this garden stood a beautiful house with pavilions adorned with [illegible] carpets, and filled with [illegible], all of perfect beauty. 'All this is thine,' said Yahya to me. I kissed his hand and poured out my thanks to him; and then I learned that on the very day when he had spoken to me of my wish he had bought the land adjoining to my house, and had caused it to be laid out for me without my even suspecting it. I had certainly noticed that building was going on, but I was far from imagining that all this was intended for me. Yahya next addressed himself to Ja'far and said: 'Here are certainly a house and grounds, but who will provide for their support?' 'I,' replied Ja'far, 'will give him a farm and its dependences, and will send him the deeds of gift.' 'Very well,' continued Yahya; 'but how is he to live until he shall receive the revenue of his property?' 'I will give him a thousand pieces of gold,' said Fadl, 'and I will send them to

Thanks to these magnificent gifts, I afterwards gained

Asia Minor in the year 181 (A.D. 797-798), and
the following years his general gained continual
s over the Byzantines, so that Irene was compelled
ter peace. An attack by the Khazars called the
attention from his successes in Asia Minor. That
had made an irruption into Armenia, and then
had been so sudden that the Moslems were unable
nd themselves, and a hundred thousand of them
ere reduced to captivity. Two valiant generals,
ma b. Khazim and Yazid b. Mazyad, marched
the Khazars and drove them out of Armenia.
he mid st of the cares of war, Harun did not forget
igious duties, and few years passed without h
the pilgrimage. In one of these pilgrimages, A.D. 802, he was accompanied by his two eldest
Mohammed and 'Abdallah, and having determined
he order of succession in so formal a manner as to
ay all pretext for future contentions, he executed
by which he appointed Mohammed his immediate
fter him 'Abdallah, and after 'Abdallah a third of
s, named Kásim. Mohammed received the surname
min (The Sure), 'Abdallah that of Al Ma'mún (He
in whom men trust), and Kásim that of Mo'tamin billá
(He who trusts in God). Hárún further stipulated that
Ma'mún should have as his share, during the lifetime of
his brother, the government of the eastern part of the
empire. Each of the parties concerned swore to observe
faithfully every part of this deed, which the Caliph caused
to be hung up in the Ka'ba, imagining that it would be
thus guaranteed against all violation on the part of men.
These precautions were to be rendered vain by the perfidy
of Amin. We shall see hereafter how he kept his oath
and how he expiated his treachery by death.

It was in the following year, at the very moment when
the Barmecides thought their position most secure, that
Hárún brought sudden ruin upon them. The causes of
this disgrace have been differently stated by the annalists.
Some relate that the Caliph, preferring to all other society
that of his sister 'Abbasa and of Ja'far b. Yahyá, resolved
to unite them in marriage, in order to be able to bring
them together in his presence without a breach of etiquette.
He meant, however, that Ja'far should continue to be
only the nominal husband of his sister. Ja'far accepted
this condition, but it was not long before he forgot it,
and the Caliph learned that his sister had given birth to a
son. This, it is said, was the cause of Ja'far's disgrace,
which involved his father and his brother. This story
may be true; but the principal cause of the fall of the
Barmecides appears to have consisted in the abuses of
power of which they had been guilty, and in the sovereign
influence which they exercised on those around them.
The Barmecides lived in a magnificent palace opposite to
that of the Caliph. Seeing one day an extraordinary crowd
around the dwelling of his first minister, Hárun was moved
to say: "Verily Yahyá has taken all business into his
own hands, he it is who really exercises supreme power;
as to me, I am Caliph only in name." This secret dis-
satisfaction was increased by a new act of disobedience
on the part of Ja'far. Hárún had ordered him to put to
death secretly a member of the house of 'Alí, whose
intrigues he dreaded. Ja'far allowed the victim to escape,
and afterwards swore to the Caliph that his orders had
been executed. Soon after, however, information against
him was given to Hárún, who, after compelling Ja'far to
acknowledge the truth, had his head struck off and brought
to him by Masrúr, the chief of his eunuchs. On the very
next day Yahya, his son Fadl, and all the other Barmecides, were arrested and imprisoned; all their property
was confiscated; and Hárún chose as his prime minister
Fadl b. Rabí', who had been his chamberlain.

In the same year, a revolution broke out at Constantinople, which overthrew the Empress Irene, and raised
Nicephorus to power. The new emperor had scarcely
ascended the throne, when he thought himself strong
enough to refuse the payment of tribute, and wrote a
insulting letter to Harun, who contented himself with
replying: "Thou shalt not hear, but see, my answer."
He then assembled an army, entered Asia Minor, and
took Heraclea, plundering and burning along his whole
line of march, till Nicephorus, in his alarm, sued for
peace. Scarcely had the Caliph returned into winter
quarters, when Nicephorus broke the treaty. Notwithstanding the rigour of the season, Hárún retraced his
steps, and this time Nicephorus was compelled to observe
his engagements. The year after, A.H. 189 (A.D. 805), disturbances arose in Khorasán. They were caused
by the malversations of the governor of that province,
Ali b. 'Isa, and the Caliph went in person to Merv to
judge of the reality of the complaints which had reached
him. 'Ali b. 'Isá hastened to meet the Caliph on his
arrival at Ray. He brought with him a great quantity
of presents, which he distributed with such profusion

among the courtiers that every one found a thousand reasons for excusing his conduct. Hárún confirmed him in his post and returned to Baghdád, through which, however, he only passed, and went on to Rakka on the Euphrates, a city which became his habitual residence. He did not long enjoy the repose which he went there to seek, for Nicephorus again broke the treaty of peace, and the Caliph was obliged to take the field anew. Once more Nicephorus was beaten, and so completely that he was obliged to submit to the very harsh conditions which the victor imposed on him.

Two years later, new disturbances broke out in Khorasán, where a certain Ráfi' b. Laith had revolted. Hárún set out again for that province, accompanied by his son Ma'mún. It was to be his last journey. He was attacked by a tumour in the abdomen, and struggled in vain against this malady, which carried him off a year after his departure, A.H. 193 (A.D. 808-809), just on his arrival at the city of Tús, the birthplace of the great epic poet of Persia, Firdausí. Hárún was only forty-seven years of age.

6. On the death of Hárún, his minister Fadl b. Rabí' hastened to call together all the troops of the late Caliph, and to lead them back to Baghdad, in order to place them in the hands of the new sovereign, Amín. He even led back the corps which was intended to occupy Khorasan, and which ought to have fallen to the share of Ma'mún, according to the testament of Hárún. Fadl b. Rabí' thus committed a serious violation of the rights of Ma'mún, but he cared little for this, being chiefly desirous of winning the confidence of the new Caliph. He was quite aware, however, that in thus acting he was making Ma'mún his irreconcilable enemy; and he therefore purposed to use every endeavour to arouse against him the enmity of his brother Amín. He advised him to exclude Ma'mún from the succession, and the Caliph was weak enough to listen to him. Receiving the order to resign his government of Khorasán and to repair to Baghdad, Ma'mún was greatly perplexed; but his tutor and vizier, Fadl b. Sahl, reanimated his courage, and pointed out to him that, if he obeyed the orders of the Caliph, certain death awaited him at Baghdád. Ma'mún resolved to hold out against Amín, and found pretexts for eluding the orders of his brother and remaining in Khorásán. Amín, in his anger, caused the testament of his father, which, as we have seen, was reserved in the Ka'ba, to be destroyed, declared, on his own authority, the rights of Ma'mún to the Caliphate to be forfeited, and caused the army to swear allegiance to his own son Músá, a child five years of age, on whom he bestowed the title of Náṭiḳ bil Ḥaḳḳ, "He who speaks according to truth" (A.H. 194, A.D. 809-810). On hearing the news, Ma'mún, strong in the rightfulness of his claim, retaliated by suppressing the Caliph's name in all public acts. Amín immediately despatched to Khorasan an army of fifty thousand men, under the command of 'Alí b. 'Isá. Ma'mún, on his side, raised troops among his faithful people of Khorásán, and entrusted their command to Táhir b. Hosain, who displayed remarkable abilities in the war that ensued. In the following year, the two armies met under the walls of Ray, and victory declared for Táhir. Ma'mún now no longer hesitated to take the title of Caliph. The year after, Amín placed in the field two new armies, commanded respectively by Ahmed b. Mazyad and 'Abd Alláh b. Homaid b. Kahtaba. The skilful Táhir b. Hosain succeeded in creating divisions among the troops of his adversaries, and obtained possession, without striking a blow, of the city of Holwán, an advantage which placed him at the very gates of Baghdád. Ma'mún immediately sent Táhir reinforcements under the orders of Harthama b. A'yan, which enabled him to maintain a firm hold on all the conquered territory, and to continue his victorious march to the capital. Reverses naturally lead to fresh reverses. One after the other the provinces fell away from Amín, and he soon found himself in possession of Baghdád alone, which was speedily invested by the troops of Táhir and Harthama. That unfortunate capital, though blockaded on every side, made a desperate defence for two years. Ultimately the eastern part of the city fell into the hands of Táhir, and Amín, deserted by his followers, was compelled to surrender. He resolved to treat with Harthama, as he hated Táhir, but this step caused his ruin. Táhir learned by his spies that Harthama was to receive the Caliph in person, and gave orders to a body of horsemen to arrest Amín as he issued from Baghdad under cover of the night. On the bank of the Tigris, Harthama awaited Amín with a boat, but scarcely had the Caliph set foot in it, when the agents of Táhir poured on it a storm of arrows and stones. The boat sank, and the Caliph had to make his escape by swimming. But he was closely followed up, and had scarcely left the river when he fell into the hands of his enemies, who shut him up in a hut and went to inform Táhir of the capture. The victorious general immediately ordered him to be put to death, and the order was carried out. The head of the unfortunate Amín was cut off and sent to Ma'mún, A.H. 198. It was presented to him by his vizier, Fadl b. Sahl, surnamed Dhú 'l-Riyásatain, or "the man with two governments," because his master had committed to him both the ministry of war and the general administration. Ma'mún, on seeing the head, hid his joy beneath a feigned display of sorrow.

7. On the day following that on which Amín had perished so miserably, Táhir caused Ma'mún to be proclaimed at Baghdad. The accession of this prince appeared likely to put an end to the evils of civil war, and to restore to the empire the order necessary for its prosperity. It was not so, however. The reign of Ma'mún that reign on which art, science, and letters, under the patronage of the Caliph, threw so brilliant a lustre, had a very stormy beginning. Ma'mún was in no haste to remove to Baghdad, but continued to make Merv his temporary residence. In his gratitude to the two men to whom he owed his throne, he conferred on Táhir the government of Mesopotamia and Syria, and chose as prime minister of the empire Fadl b. Sahl, who had been already his vizier in the government of Khorasan. The adherents of 'Alí seized on the elevation of Ma'mún to power as a pretext for fresh revolts at Mecca, at Medina, and in 'Irák. At Cufa a certain Ibn Tabátaba also broke out into open rebellion, and placed an army in the field under one of his partisans, Abú 'l-Saráya. Hasan b. Sahl, brother of Ma'mún's prime minister, who had been made governor of all the provinces conquered by Táhir, immediately sent troops against Cufa. They were defeated, and Abú 'l-Saráya, encouraged by this first success, and no longer finding a secondary part sufficient for his ambition, poisoned his chief Ibn Tabátaba, and put in his place another of the family of 'Alí, Mohammed b. Mohammed, whom, on account of his extreme youth, he hoped to govern at his will. Fresh troops sent against Abú 'l-Saráya fared no better than the first, and several cities of 'Irák, as Basra, Wasit, and Medain, fell into the hands of the rebels. Abú 'l-Saráya was already marching against Baghdad, when Hasan b. Sahl, in great alarm, had recalled Harthama b. A'yan, one of the heroes of the civil war, who was already on his way back to Merv. As soon as this general had returned from Khorasan, the face of affairs changed. The adherents of 'Alí were everywhere driven back, and the whole of 'Irák fell again into the hands of the 'Abbásids. Cufa was taken by assault, and both Abú 'l-Saráyá and Mohammed b. Mohammed were

made prisoners. The former had his head struck off; the latter was sent to Khorásán. The revolt in Arabia was also quickly stifled, and it might have been supposed that peace was about to be re-established. This, however, was by no means the case. The civil war had caused a swarm of vagabonds to spring, as it were, from underground at Baghdád. They proceeded to treat the capital as a conquered city, and such was their audacity that they plundered houses and carried off women and children at mid-day. It became necessary for all good citizens to organize themselves into a regular militia, in order to master these ruffians. Meanwhile, at Merv, Ma'mún was adopting a decision which fell like a thunderbolt on the ʿAbbásids. In A.H. 201 (A.D. 816-817), under pretence of putting an end to the continual revolts of the partisans of ʿAlí, and acting on the advice of his prime minister, Fadl, he publicly designated as his successor in the Caliphate ʿAlí b. Músá, a direct descendant of Hosain the son of ʿAlí, and proscribed black, the colour of the ʿAbbásids, in favour of that of the house of ʿAlí, green. This step was well calculated to delight the followers of ʿAlí, but it naturally could not fail to exasperate the ʿAbbásids and their partisans. The people of Baghdád refused to take the oath to ʿAlí b. Músá, and, becoming presumptive, declared Ma'mún deposed, and elected his uncle Ibrahim, son of Mahdí, to the Caliphate.[1] The news reached the Caliph only indirectly, for his minister Fadl, desiring to leave Ma'mún only the shadow of power, kept all important events carefully from his knowledge. The eyes of the Caliph were opened, and he now perceived that Fadl had been treating him as a puppet. His anger knew no bounds. Fadl was one day found murdered, and ʿAlí b. Músá died suddenly. The historians bring no open accusation against Ma'mún of having been the two personages; but it seems clear that it was not chance that did him such a seasonable service. Ma'mún of course affected the profoundest grief, and, in order to disarm suspicion, appointed as his prime minister the brother of Fadl, Hasan b. Sahl, whose daughter Burán he also afterwards married. But on the other hand, in order to quiet the people of Baghdád, he wrote to them: "The cause of your dissatisfaction in the heinous ʿAlí b. Músá no longer exists; since he who was the object of your resentment has just died." From that moment the pseudo-Caliph Ibrahim found himself deserted, and was obliged to seek safety in concealment. His precarious reign had, however, lasted nearly two years. Ma'mún now decided on making a public entry into Baghdád, but to show that he came as a master, he still displayed for several days the green flag of the house of ʿAlí, though at last, at the entreaty of his courtiers, he consented to resume the black. From this time the real reign of Ma'mún began, freed as he now was from the guardianship of Fadl. His general Tahir alone continued to excite his suspicions. Under the pretence that he could no longer endure the sight of the murderer of his brother, he removed Tahir to a distance by appointing him governor of Khorásán. Like most of the great Muslim generals, Tahir, it is said, conceived the project of creating an independent kingdom for himself. His death, A.H. 207, prevented its realization; but as his descendants succeeded him one after the other in the post of governor, he may be said to have really founded a dynasty in Khorásán. When, two years later, the impostor Bábak set up a communistic sect in Armenia and Azerbaijan, it was a son of Tahir, ʿAbdallah, who was commissioned by Ma'mún to put him down. Notwithstanding his ability, ʿAbdallah could not accomplish the task, and it was only under Ma'mún's successor that Bábak was taken and put to death.

Ever since Ma'mún's entry into Baghdád, the pseudo-caliph Ibráhím had led a wandering life. He was arrested one night in Baghdád, under the disguise of a woman, and brought before Ma'mún. The latter generously pardoned him, and also granted an amnesty to the former minister of Amín, Fadl b. Rabí', although he had been the chief promoter of the terrible civil war which had so lately shaken the empire. After that time, Ibráhím the son of Mahdí lived peacefully at the court, cultivating the arts of singing and music, in which he excelled.

Tranquillity being now everywhere re-established, Ma'mún gave himself up, without hindrance, to his scientific and literary tastes. He caused works on mathematics, astronomy, medicine, and philosophy, to be translated from the Greek. It was also by his orders that two learned mathematicians undertook a measurement of a degree of the earth's circumference. Ma'mún interested himself, too, in questions of religious dogma. Shocked at the opinion which had spread among the Moslem doctors, that the Koran was the uncreated word of God, he published an edict commanding them to renounce this error. Several distinguished doctors, and, among others, the celebrated Ibn Hanbal, founder of one of the four orthodox Moslem sects, were obliged to appear before an inquisitorial tribunal; and as they persisted in their belief respecting the Koran, they were thrown into prison. Meanwhile, war having broken out between the Greeks and the Moslems, Ma'mún set out for Asia Minor, to put himself at the head of his army. On his arrival at Tarsus he received from the governor of Baghdád the report of the tribunal of inquisition, and ordered that the culprits should be sent off to him. Happily for these unfortunate doctors, they had scarcely started on the road to the frontiers, when news of the Caliph's death reached Baghdád. Ma'mún having bathed in the Podendon, a burning fever was the result, which brought him to the grave in A.H. 218 (A.D. 833). Before his death, he designated as his successor his brother Mo'tasim billáh (whose surname is Defence in God), whom he had for a long time preferred to Mo'tamin.

8. The accession of the new Caliph Mo'tasim met at first with active opposition in the army, where a powerful party had been formed in favour of ʿAbbás, the son of Ma'mún. Thanks, however, to the disinterested conduct of that prince, civil war was averted. ʿAbbás publicly renounced all pretension to the Caliphate, and took the oath of allegiance to his uncle. Mo'tamin, the son of Harún, imitated the conduct of ʿAbbás, and the whole army accepted Mo'tasim, who made his public entry into Baghdád in the month of Ramadan 218.

The new Caliph, far from putting a stop to the persecution which had been directed against the orthodox doctors, took up and carried out the views of Ma'mún. The doctor Ibn Hanbal was beaten with rods and thrown into prison, together with several of his companions, and was not restored to liberty till the Caliphate of Motawakkil. This persecution had already prejudiced the people against Mo'tasim, and their discontent became more marked when the Caliph created a new body of troops, specially intended to watch over his person. This new guard was composed of Turks, an unbridled and undisciplined body of soldiery who, moreover, held in open contempt the religious precepts of Islam. Tired of the excesses of every kind committed by the Turks, the people of Baghdád rose in insurrection, and Mo'tasim, not daring to act with severity either against his guard or the citizens, took the course of quitting the city. Leaving the government of the capital in the hands of his son Wáthik billáh (He who trusts in

[1] On this event, see a remarkable essay by Barbier de Meynard, in the *Journal asiatique* for March-April, 1869.

od), he established himself with his guard at Sámarra, a mall place situated a few leagues above Baghdád, and hanged its name to Sorra-man-ra'a (He rejoices who es it). This resolution of Mo'tasim was destined to cove fatal to his dynasty; for it placed the Caliphs at the ercy of their Prætorians. In fact, from the time of Io'tasim, the Caliphate became the plaything of the urkish guard, and its decline was continuous. Some orious feats of arms, however, were still performed nder Mo'tasim. The sectary Bábak was at last taken by fshín, a Turkish general of the Caliph, in the year 223 .D. 837-838). Babak was carried to Baghdad, led hrough the city on the back of an elephant, and then elivered to the executioners, who cut off his arms and is legs. Afshín, however, was very ill rewarded for his ervices, for shortly afterwards the Caliph had him put to eath on a charge of heresy.

The death of Ma'mún had for the moment suspended ostilities with Constantinople, under Mo'tasim the war as rekindled. A valiant Greek general, Manuel, who ad incurred the displeasure of the Emperor Theophilus, ook refuge with the Caliph, who eagerly welcomed him nd gave him a command. Manuel began by reducing horásán, which had risen in revolt, and Mo'tasim was so ell satisfied with him that he thought of employing him gainst his own countrymen. This was precisely what heophilus dreaded, and he took measures accordingly to ring back the banished general to his side. He sent an mbassador to Mo'tasim, under pretence of ransoming me Greek prisoners; but the real object of his mission, hich he contrived to communicate to Manuel, was the ecall of that general. Manuel, forgiving great animosity gainst his country, himself asked to be allowed to lead a Moslem army into Cappadocia. The Caliph granted his equest, and sent with him his own son Wathik billah ut, as soon as they reached the frontiers of Cappadocia, lanuel confessed to the young prince that his intention as to return to Constantinople, and quitted the army. heophilus, taking advantage of the confusion into which he departure of Manuel had thrown the Moslems, made n incursion into Syria, laid waste that province as far as abatra, and returned loaded with booty. At the news of is disaster, Mo'tasim assembled a formidable army, stimated at more than two hundred thousand men, enetrated into Asia Minor, beat the Greeks, and took he city of Amorium, which he ordered to be razed to the round. A revolt which broke out at Baghdad in favour f his nephew 'Abbás, the son of Ma'mun, compelled the Caliph to turn back. Mo'tasim had the unfortunate Abbás arrested, and he was soon after found dead in his rison. Mo'tasim survived him only four years. He died t Sorra-man-ra'a, in A.H. 227 (A.D. 841-842).

9. His son Wáthik, who succeeded him, showed himself o less intolerant on the doctrinal question of the uncreated Koran. He carried his zeal to such a point that, n the occasion of an exchange of Greek against Moslem risoners, in the year 231 (A.D. 845-846), he ordered that ll the Moslem captives who would not declare their elief that the Koran was a human work, should be left n the hands of the enemy. The reign of Wáthik billah was not otherwise marked by any very striking events. He died in 232 (A.D. 846-847), after a reign of five years, as he had appointed no successor before his death, the principal personages of the state at first cast their eyes on is son Mohammed; but they had scarcely saluted him with the title of Caliph, when they changed their purpose, nd offered the supreme power to Motawakkil 'ala 'llah He who trusts to God), brother of Wáthik. This prince was therefore elected in the same year in which Wáthik ied.

10. The first act of Motawakkil was an atrocious cruelty. He seized Mohammed b. 'Abd al Melik, his brother's vizier, who had always been his enemy, and ordered him to be placed in a furnace bristling within with iron points, which was then raised to a red heat. The Caliph looked on at the agonies of his victim incessantly repeating: "Pity is a weakness." This had been the favourite maxim of the unfortunate vizier. An impostor named Mohammed b. Faraj had set himself up as a prophet, giving out that he was Moses risen from the dead. By means of this pious fabrication, he had contrived to attract twenty-seven followers. The Caliph had him seized, and condemned him to perpetual imprisonment, but first he compelled each of the followers of Mohammed to give the pretended prophet ten blows on the head with his fist; and the poor wretch expired under the hands of his own disciples (A.H. 235, A.D. 849-850).

In the year of his elevation to the Caliphate, Motawakkil had regulated the succession to the empire in his own family, by designating as future Caliphs his three sons, Montasir billah (He who seeks help in God), Mo'tazz billah (Strong through God), and Mowayyad billah (Assisted by God). In acting thus, his object was to protest against the tendency of his predecessors to favour the house of 'Alí, and to guard against the attainment of the Caliphate by any member of that house. Motawakkil displayed the most extreme hatred for the descendants of the Prophet. He even went so far as to destroy the chapel erected over the tomb of Hosain at Kerbela, and to forbade the Shí'ites to visit the spot. Not content with attacking the liberty and the property of the descendants of 'Alí, he insulted their belief, by taking buffoons into his pay, whose business it was to turn the person of 'Alí into mockery. He also persecuted the Christians and the Jews; excluding them from all public employments, and obliging them to send their children to Moslem schools. In the year 237, a revolt broke out in Armenia. The Caliph sent the Turk Bugha against the rebels, but they met him with a vigorous resistance, and it was four years before peace was restored to the province. During that time the Greeks effected a descent on Egypt, and Damietta was taken and burned. Motawakkil caused Damietta to be fortified, and transferred his own residence to Damascus, doubtless that he might be able to keep a closer watch on the proceedings of the Byzantines. He soon thought himself strong enough to take the offensive, and poured his Turkish soldiery into Asia Minor, where they encountered the same Manuel who had been formerly received at the court of Mo'tasim. After an alternation of successes and reverses, both Moslems and Greeks retired from the conflict. Motawakkil then returned to his residence at Sorra-man-ra'a, and there caused a magnificent quarter to be built, which he called Ja'fariyya[1]. There he gave himself up to debaucheries, till at last, during one of his orgies, he was murdered by a Turkish soldier named Wasif, who had been bribed to the deed by his own son Montasir billah (A.H. 247, A.D. 861-862).

11. On the very night of his father's assassination Montasir had himself proclaimed Caliph. The conspirators among the Turkish soldiery compelled him to deprive his two brothers, Mo'tazz and Mowayyad, who were not agreeable to them, of their rights of succession. Montasir did not long enjoy the fruits of his crime. He died five months after, by poison, it is said.

12. The Turkish soldiery, which now arrogated to itself the mastery over the Caliphate, chose in succession to Montasir his cousin Ahmed, who took the title of Mosta'

[1] That is, "City of Ja'far." Ja'far was Motawakkil's own proper name.

billáh (He who looks for help to God). Under the reign of this feeble prince, the Greeks inflicted serious losses on the Moslems in Asia Minor. The Turkish soldiery, instead of attempting to repair these losses, revolted against the Caliph whom they had themselves chosen, and plundered the city of Sorra man ra'a. Taking advantage of these disorders, a descendant of 'Alí, named Hasan, gained possession of Tabaristán and Jorján, and permanently deprived the Eastern Caliphate of those provinces. At the same time, insurrections sprang up in every part of the empire. Next, the chiefs of the Turkish soldiery, in their mutual jealousies, began to tear each other to pieces. The infatuated Caliph fled from Sorra man ra'a, and took refuge at Baghdád. The Turks now resolved on his destruction, and forgetting that they themselves had deprived Mo'tazz billáh, brother of Montasir, of his legitimate rights, chose him as their Caliph. They next placed at their head a brother of Mo'tazz, named Mowaffak billah, and besieged Mosta'in at Baghdád. At the end of one month (A.H. 252, A.D. 866), Mosta'in surrendered, and was put to death.

13. Mo'tazz billáh, thus called to the throne by the very men who had previously sought to exclude him from it, resolved to free himself from the yoke of the formidable Turkish soldiery which thus made and unmade Caliphs. But to maintain a struggle against such terrible adversaries, the new sovereign would have needed an ability and energy which he did not possess. He made, indeed, a very impolitic beginning in getting rid of his brothers Mowayyad and Mowaffak, of whom he put the former to death, and drove the latter into exile. Some time after, it is true, he had the satisfaction of seeing Wasif, one of the chief of the Turkish soldiery, lose his life in a mutiny of his own troops, and that of defeating in person another chief, Bugha, whom he afterward caused to be beheaded. But in the following year (A.H. 254), the Turks chose as their leaders the sons of Wasif and Bugha, Sálih and Mohammed, who avenged their fathers by plundering the palace of the prime minister and besieging that of the Caliph, whom they seized and threw into close confinement, where he died of hunger and thirst, A.H. 255.

14. Immediately after the fall of Mo'tazz, the Turks brought from Baghdad one of the sons of Wathik billah, and proclaimed him Caliph, with the title of Mohtadi billah (Guided by God). Mohtadi, a man of noble and generous spirit, exerted himself, but in vain, to release his predecessor from prison. Having failed in this, he kept the vexatious measure of power which his masters left him, and applied it to the regeneration of Moslem society, the decay of which appeared to him imminent. He forbade wine and games of chance; he devoted much of his time to the administration of justice; he examined in person every sentence passed by the judges, and gave public audience to the people twice a week for the redress of their grievances. The farmers of the revenue were subjected to strict control, and the taxes were considerably lightened. It seemed as if these reforms were likely to re-establish order and prosperity in the empire. But Mohtadi came too late, and the Turks did not leave him time to finish his work. Sálih, one of the chiefs of the Turkish soldiery having been assassinated by a rival, Mohtadí punished the guilty person with rigour. The Turks, in their rage, besieged the palace and slaughtered the unfortunate Caliph (A.H. 256, A.D. 870).

15. Whether from weariness, or from repentance, the Turkish soldiery discontinued for a time their hateful excesses. A son of Motawakkil was brought out of prison to succeed his cousin, and reigned for twenty-two years under the name of Mo'tamid 'ala 'llah (He whose support is God). During his reign two great events took place, tokens and precursors of the dissolution of the Caliphat Eastern Persia and Egypt separated themselves by for from the empire, and two new dynasties establish themselves in these countries, those respectively of t Saffárids and the Túlúnids. The founder of the form Ya'kúb b. Laith, was the son of a coppersmith (Saffá At the head of a band of resolute men, he invaded succes ively Khorásan, Kirmán, and Sijistán, and at last the Cali Mo'tamid, powerless to arrest his progress, was obliged give an official recognition to accomplished facts. B Ya'kub was not satisfied with this; he soon possess himself of Tabaristán, Fársistán, and Ahwáz, and then marched against Baghdád. Fortune, however, desert him, he was beaten in the neighbourhood of Wásit (A. 262), and compelled to return to Persia in order to levy new army there. In 265 he resumed his march again Baghdád, but was obliged by sickness to halt at Jond ábúr, where he died: not, however, till he had obtain from the Caliph a formal investiture of all the provinc he had conquered. He was succeeded by his broth 'Amr. On the other side, a certain Ahmed b. Túlún, t son of a freedman, who had obtained from the Caliph t post of governor of Egypt, planned the creation for himse of an independent kingdom. Under Mo'tamid he ev invaded Syria, and perhaps would have pushed his co quests still farther, had not death overtaken him in A. 270 (A.D. 883-884). His son Khomarúya succeeded hi in Egypt, and though, at a later period, he submitted pay tribute to Mo'tadid, nevertheless a dynasty had be founded in that country which lasted for twenty one yea longer. Mo'tamid died eight years after Ahmed b. Túlú

16. The reign of Mo'tadid billáh (He who seeks l support in God), who succeeded his uncle Mo'tamid, principally remarkable for the rise of the celebrated se of the Carmathians (Karámita), who for two centuries la waste the Moslem empire, and for the extinction of t Saffarid dynasty in Persia, where it was replaced by th of the Samanids. Some details respecting the origin a the creed of the Carmathians will be found in the thi section of this article. We shall content ourselves here wi stating the fact that these sectaries, who were numero in 'Irak, Syria, and Eastern Arabia, kept in check all t armies which were sent against them. Under the reign Mo'tadid they invaded Mecca and committed great ravag there. In A.H. 281, Mo'tadid repaired the disasters whi they had caused there, and raised important works abo the Kába. Mo'tadid died in 289 (A.D. 902), leavi the throne to his son Moktafí billáh.

17. Moktafí billáh (He who sufficeth himself in Go reigned for six years, during which he had constantly struggle against the Carmathians. One of his genera indeed, gained a signal victory over these sectaries; but, avenge their defeat, they lay in wait for a caravan whi was on its return from Mecca, and massacred twen thousand pilgrims. This horrible crime raised the wh of Arabia against them. The Carmathians were beat again, and Dhikruya one of their ablest generals, w taken and put to death. The sectaries remained quiet f some time, and the Caliph took advantage of this respi to take Egypt from the house of Túlún, and to confer i government on the Ikhshídites. Moktafí died A.H. 2 (A.D. 907-908). His activity and energy revived for moment the prestige of the Caliphate; but this fleeti renewal of its greatness was soon to disappear, and dec resumed its course.

18. The new Caliph, Moktadir billáh (Powerful throu God), was only thirteen years of age when he ascend the throne. His extreme youth prejudiced the people Baghdád against him; they rebelled, and swore allegian to 'Abdalláh, son of the former Caliph Mo'tazz; but t

arty of Moḳtadir prevailed, and his rival was put to eath. Moḳtadir, however, was too young to exercise ny real power; he was governed by his eunuchs. He was, esides, a man of feeble character, and looked on helpssly at the death-struggle of the empire, upon which alamities of every kind now poured in. The Greeks nvaded Mesopotamia. A truce was concluded with them, ut the Carmathians then recommenced their disorders in yria. The indolence of the Caliph, and his inaction in he face of this danger, alienated all hearts from him, and he eunuch Múnis, the principal chief of his party, took he lead in deposing him and proclaiming in his stead his rother Ḳáhir billáh (Victorious through God), in the ear 317 (A.D. 929-930). Kahir, however, having refused o distribute a donative to the army on the occasion of his ccession, a counter revolution took place, and Moktadir, who had been imprisoned, was taken from his dungeon nd replaced on the throne, only three days after his deosition. Favoured by these disturbances, the governor of Iosul, Násir al-Daula, declared himself independent, and ounded definitively the dynasty of the Hamdanits; thus ausing an additional dismemberment of the empire. The armathians in their turn, under the guidance of a new chief, Abu Táhir, obtained possession of Mecca, and carried off he celebrated black stone of the Ka'ba, which they did not estore till very long afterwards. Meanwhile the eunuch Múnis had been disgraced. He withdrew at first to Mosul, o the court of Násir al-Daula; but it was to raise an rmy and march upon Baghdad, where the Caliph had gain fixed his abode. The object of Munis was not to ttack the Caliph, but only to take vengeance on his ersonal enemies. Moḳtadir was induced by evil counellors to make a sally against Munis. His troops were ut to the rout, and he himself fell on the field of battle, n the year 320 (A.D. 932).

With the reign of Moḳtadir is connected one of the reatest events in the history of the Caliphate, the foundaion of the Fátimite dynasty, which reigned, first in the Maghrib and then in Egypt, for nearly three centuries. The first of this family who put forward any pretensions o the Caliphate was 'Obaid Allah, surnamed the Mahdi, or Messiah of the followers of 'Alí, who gave himself out as direct descendant of 'Alí, through his wife Fatima, the aughter of Mohammed, whence the name of Fatimite. It eems to be proved that 'Obaid Allah was really descended rom a certain 'Abdalláh b. Maimun el Kaddáh, the ounder of the Ismailian sect, of which the Carmathians were only a branch. This 'Obaid Allah had himself become pontiff of the Ismailians. As early as the Caliphate of Moktafí, one of 'Obaid Alláh's missionaries, named Abú 'Abdalláh, had succeeded in gaining numerous partisans in the province of Africa, then subject to the Aghlabites, and the victories of this missionary had wrested Eastern Africa from the family of Aghlab when Moḳtadir ascended the throne. 'Obaid Allah then repaired to his new realm (A.H. 303), and founded the city of Mahdíya, which he made his capital. He tried also, but without success, to seize Egypt, the conquest of that country was reserved for one of his successors, Mo'izz li-dín-illáh. 'Obaid Alláh died two years after Moktadir, leaving to his son Ḳáim an empire already sufficiently powerful to cause uneasiness to the 'Abbásids, to the Omayyads of Spain, and to all the Christian princes whose states bordered on the Mediterranean.

19. **Ḳáhir billáh**, on being raised anew to the throne after the death of his brother Moḳtadir, still bore ill will to his patrons, and tried to free himself from their guardianship. The emirs of his court dethroned him a second time and put out his eyes. One of his nephews was then proclaimed Caliph under the name of Rádí billáh (Content through God). This prince, who was entirely governed by those about his person, created in favour of a certain Abúbekr Mohammed b. Raïḳ, the office of Amír al Omará, or Emir of the Emirs, which nearly corresponds to that of Mayor of the Palace among the Franks.[1] The Amir al Omará was charged with the administration of civil and military affairs. He also acted as the Caliph's deputy in sacerdotal functions, and was named next after him in the public prayers. Thenceforth the Caliphate was no longer anything but an empty shadow. During the reigns of Kahir and Radi, the Carmathians became more audacious than ever. The Amir al Omará was obliged to purchase from them the freedom of pilgrimage to Mecca at the price of a disgraceful treaty. Thus the Caliphate found itself almost reduced to the province of Baghdad. Khorasan, Trans-oxiana, Kirman, and Persia were in the hands of independent sovereigns, the Samanids, the Buyids, and a prince named Wa-himgir. The Hamdanites possessed Mesopotamia, the Seljukites, Armenia. Egypt was under the rule of the Ikh-hidites, Arabia was held by the Carmathians; Africa, as we have seen, had become the prey of the Fatimites. The single transient success obtained by Radi was the capture of Mosul in A.H. 328 (A.D. 939-40), and even this success he owed to the Turk Bejkem, who had succeeded Mohammed b. Raïḳ as Amir al Omara.

Radi died in the following year, and was succeeded by Mottaḳi billáh (He who fears God). From his very accession, this prince saw himself exposed to the attacks of a certain Al-Baridí, who had carved out for himself a principality in Chaldea, and who now laid siege to Baghdad. Nasir al Daula, prince of Mosul, who had been reinstated in his government, offered an asylum to Mottaki, put his troops at his disposal, and succeeded in repelling Al-Baridí. In return he obtained the office of Amir al-Omará. But there were other competitors for that post. Turun, a former lieutenant of Bejkem, protested sword in hand against the choice of the Caliph, and threatened Baghdad. Ikh-hid, sovereign of Egypt, offered Mottaki a retreat in his state, but Turun, fearing to see the Caliph obtain such powerful support, found means to entice him to his tent, and had his eyes put out, A.H. 330 (A.D. 941-942).

As successor to Mottaki, Turun chose Mostakfi billah (He who places his whole trust in God). This prince, like his predecessors, was a mere puppet in the hands of his ministers. A new Amir al Omara, Zirak b. Shirzad, made himself so hateful to the people of Baghdad by his deeds of violence and rapacity that they besought the help of the Buyid Ahmed, the third prince of that dynasty, entered Baghdad, overthrew Zirak, and took his place under the title of Mo'izz al Daula. Mostakfi soon had enough of this new master, and ventured to conspire against him. The plot was discovered, and Mo'izz al-Daula had the eyes of the Caliph put out. There were now at Baghdad three Caliphs who had been dethroned and blinded, Kahir, Mottaki, and Mostakfi. Mo'izz al Daula thought for a moment of restoring the illusory title of Caliph to the descendant of 'Ali. He feared, however, lest this should lead to the recovery by the Caliphs of their former supremacy, and his choice fell on a son of Moktadir under the name of Moti' billah (He who obeys God). Reserving to himself all the power and revenues of the Caliph, he allowed Moti' merely a secretary and a moderate pension. The prince of Mosul, who began to think his possessions threatened by the neighbourhood of Mo'izz, entered on a struggle with him and tried to wrest Baghdad from him; but he failed, and was obliged to

[1] See Defremery, *Mémoire sur les Emirs al Omara*. Paris, 1848.

subnit to the payment of tribute. We have said above that Mo'izz al Dawla professed a great veneration for the house of 'Alí. His preference showed itself in public acts. He caused the most terrible imprecations against the Omayyads to be posted up at the doors of the mosques. This tep nitated men's minds; and a general insurrection was imminent at Baghdad, when Mo'izz died (A.H. 356), leaving his power to his son 'Izz al Dawla.

While the 'Abbasid family was thus dying out in shame and degradation, the Fatimites, in the person of Mo'izz li-dín-illáh, were reaching the highest degree of power and lustre (see DEAZY, vol. vii. p. 750 *sqq.*). Jauhar, a general of Mo'izz li-dín-illáh, conquered Egypt for his master, and Arabia acknowledged the sovereignty of the Fatimite. The Carmathians, who had so long contended against the 'Abbasids, now came to better terms with Moti', and their general made the Caliph the offer of driving back the Fatimites, on condition of his grandson in the government of Egypt. Moti' preferred to stand neutral in the struggle; and the Carmathian general, who with the support of Moti' might perhaps have triumphed over Mo'izz, was beaten by his powerful rival. Moti', having been struck by paralysis, was obliged to abdicate in the year 363 (A.D. 973-974), and left the empty title of Caliph to his son Tá' li-amr-illáh (Obedient to the command of God). The new Caliph lived at first in peace, for it was now the office of Amír al Omará which provoked ill will. Under the reign of Tá' the Buyid princes contended furiously with one another for the office of Emir, and one of them, 'Adod al Dawla, having conquered 'Izz al Dawla, took the title, never before employed, of Shahin-shah, or king of kings. On his death he transmitted his office to his three sons, who held it successively, under the name of Sham al Dawla, Sharaf al Dawla, and Baha al Dawla. The last, who was as avaricious as he was ambitious, took offence at the Caliph Tá' for having disposed of certain sums of money, of which he wished to reserve the management to himself, compelled him to abdicate in A.H. 381, and replaced him by a grandson of Moktadir, who took the name of Kadir billah (Powerful through God), and reigned forty one years under the tutelage of the Búyids. Meanwhile events were preparing the fall of the Buyids. In Persia, Mahmud of Ghazni was founding the powerful empire of the Ghaznevids, which extended to the Indus, and the Seljuk Turks were already invading Khorasan. It was under the successor of Kadir billah that that sanguinary revolution took place, which was to give over the government of Baghdad to the Seljúks.

Kadir billah died in A.H. 422 (A.D. 1030-31), and was succeeded by Kaim bi-amr-illah (He who is charged with the business of God). The new Caliph, groaning under the iron hand of his Amír al Omará, called to his aid the Seljuk Toghrul Beg, who entered Baghdad in the month of Ramadan in the year 447 (A.D. 1055-1056), overthrew the Buyids, and took their place. Some years later, Toghrul married the daughter of the Caliph. At his death Toghril left to his nephew Alp Arslan the title of sultan, a flourishing empire, and unconfirmed power. Under Kaim, he enjoyed the Caliphate in peace under the tutelage of Alp Arslan and of his successor Malik Shah, till his death in A.H. 467. His grandson, Moktadi bi-amr-illah (He who obeys the orders of God), who succeeded him, owed to the power of Malik Shah the honour of recovering his supremacy in Arabia. At Medina and Mecca his name was substituted in the public prayers for those of the Fátimite Caliphs. This was, after all, a mere gratification to his vanity, for Malik Shah was the real sovereign, and the Caliph thought himself highly honoured in marrying the daughter of his powerful patron. This union, however, far from drawing closer the bonds of friendship between Malik Shah and Moktadí, became on the contrary a cause of strife. The Caliph having put away his wife, who had wearied him by her peevish humours, was compelled by Malik Shah to appoint the child whom he had had by her as his successor to the prejudice of his eldest son. Malik Shah also exiled his son in law to Basra. Just, however, as this order was about to be carried out, Malik Shah died. Moktadi survived him only a few months. It was during the reign of his successor Mostazhir billáh (A.H. 487-512) that the first crusade took place. We need not here enter into the details of those wars. It is sufficient to say that from the date of the first crusade Baghdád ceases, so to speak, to have any special history. The successors of Mostazhir billah (He who seeks to triumph through God) were Mostarshid billah (He who asks guidance from God) (A.H. 512-529); Rashid billáh (Just through God), A.H. 529-530, Moktafi l-amr illáh (He who follows the orders of God), A.H. 530-555; Mostanjid billah (He who invokes help from God), A.H. 555-566; and Mostadí' bi-amr-illáh (He who seeks enlightenment in the orders of God), A.H. 566-575. Under the last, the Fátimite dynasty was at length destroyed, and Egypt fell again under the spiritual authority of the Caliphs of Baghdád. It was one of the generals of the Emir Núr al dín, the celebrated Saláh al-dín (Saladin), who made this important conquest in A.H. 567 (A.D. 1171-1172). He maintained himself in Egypt as Sultan, founded a new dynasty, that of the Ayyúbites, and in some sort compelled Násir li-dín-illáh (He who helps the religion of God), the successor of Mostadí' (A.H. 575-622), to acknowledge his title and to ratify his usurpation.

A still more formidable danger was now threatening Baghdad. The terrible Jinghíz Khán was issuing from the depths of Asia at the head of his Mongols, and was beginning to invade Transoxiana. Under Násir li-dín-illáh's successors, Zahir billah (Victorious through God) (A.H. 622-623), and Mostansir billáh (He who asks help from God), A.H. 623-640, the Mongol invasion advanced with immense strides; and when, after them, Mosta'sim billáh (He who seeks his defence in God) was named Caliph in the year 640 (A.D. 1242-1243), the last days of the Caliphate had arrived. Hulágu, who was then sovereign of the Mongols, determined to make himself master of the whole of Western Asia. He placed himself at the head of his immense hordes, swept everything before him on his march, and arrived under the walls of Baghdád. In vain did Mo'tasim sue for peace. The siege was actively pursued, and on the 29th of Moharram 656 (5th February 1258), the Mongols forced their way into Baghdad and planted the standard of Hulágu on the highest of its towers. The city was given up to fire and slaughter; Mo'tasim was thrown into prison, and died there a few days after; and with him expired the Eastern Caliphate, which had lasted 626 years, from the death of Mohammed.

In vain, three years later, did a scion of the race of the 'Abbasids, who had taken refuge in Egypt, make an effort to restore a dynasty which was now for ever extinct. At the head of a few followers, he marched against Baghdád but was repulsed by the governor of that city, and died fighting. At a later period, another descendant of the 'Abbasids also sought an asylum in Egypt. The Sultan Baibars, after a judicial investigation of his origin, proclaimed him Caliph under the name of Hákim bi-amr-illáh. His sons inherited this empty title, but, like their father, remained in Egypt, without power or influence. The shadow of sovereignty continued to exist till the conquest of Egypt by the Turks.

III.—SKETCH OF THE INSTITUTIONS AND CIVILIZATION OF THE EASTERN CALIPHATE.

hammed had begun to bestow political unity on Arabia, e had done still more: he had given her the Koran, starting-point and base of the future civilization of . It was for the preservation and the better understanding of the sacred text that the first believers were create grammar and lexicography, and to make collh of the poems of their own and former times, those esses of the meaning of words," as the Arabs call To elucidate questions of dogma they created gy. Jurisprudence, in like manner, issued from the n, and the historical sciences at first gathered around As early as the first century of the Flight, schools founded in 'Iráḳ, at Baṣra and at Cufa, in which all uestions to which the study of the Koran gave rise stated, and answered in different ways. Natural e and mathematics were less directly concerned with acred book, and were consequently neglected during whole period of the Omayyad dynasty. They only to be cultivated when, under the 'Abbásids, the study of philosophy led to the use of translations from the Greek. The institutions of Islam were developed, no doubt, as new wants made themselves felt, in proportion to the extension of the empire, but they were nevertheless founded on the first arrangements made by the Prophet and handed down by him in the Koran.

Under the first four Caliphs these institutions continued in a rudimentary state. The Caliph (*Khalífa*, substitute or successor) was elected by the Moslem community and, after receiving from all its members the oath of fidelity (*Bai'a*) which they were bound to take, united the temporal and spiritual powers in his own hand. He was at the same time high priest, ruler and judge. He was compelled, however, by the very extent of the empire to delegate his powers to these agents (*Amil*, plural *'Ommal*) whom he commissioned to represent him in the provinces. The State revenues, which entered the public treasury (*Bait al mál*), were composed (1) of the tithe, or tax for the poor (*Zakát*), which every Moslem was bound to pay; (2) of the fifth, raised on all booty taken in war, the rest being divided among the warriors; (3) of the poll tax (*Jizya*) and the land tax (*Kharáj*), which only affected non-Moslem subjects. The Caliph administered the revenues of the State at his own pleasure, applying them to the necessities of war, to public works, to the payment of officials, to the support of the poor, and to the distribution of the annual pensions, in which every Moslem had originally a right to share. The State could possess landed property. Under 'Omar I. we find that the pasture land belonging to the State supported not less than forty thousand camels and horses. To 'Omar I. was due the regulation of the poll tax by a fixed scale. The rich, whether Christians or Jews, paid four dinars (about thirty two shillings) yearly; people of the middle class, two dinars; the poor, one dinar. Besides the payment in money, the subject races had to make contributions in kind, intended for the support of the troops. The land tax consisted of a general rent in proportion to the extent, character, and fertility of the lands possessed by the conquered.

As the sums produced by these different imposts were often very considerable, it became necessary, as early as the Caliphate of 'Omar I., to create a special office charged with the account of their expenditure. This organization was borrowed by Omar from the Persians, and it retained its Persian name of Diwan, a term afterwards applied to all government offices. The Arabs, at that time being too illiterate for such employment, the task of keeping the registers of the Diwan was entrusted to Greeks, Copts, and Persians. 'Omar also gave his attention to the apportionment of the individual pensions of the Faithful. Every one received a larger or smaller sum according to the greater or less nearness of his connexion with the family, or the tribe, of the Prophet. Thus 'Aïsha, who had been the favourite wife of Mohammed, received every year a pension of twelve thousand dirhems,[1] the other widows of the Prophet only received ten thousand. The Hashimites and Mottalibites, that is members of the Prophet's family, also received ten thousand dirhems. The Emigrants and the Defenders, those citizens of Mecca and Medina who had been the first to embrace Islám, had five thousand dirhems, and that was the sum which 'Omar I. allotted to himself. For every other Moslem of full age, the pension varied from 1000 to 300 dirhems. We can easily understand what an influence the hope of this pension must have exerted on the conquered races, and how much it must

[1] The dirhem was equivalent to one franc.

[2] His moderation was not imitated by his successor, 'Othman, who made it his principal object to enrich all the members of his own family at the expense of the rest of the Moslems.

have contributed to their conversion. On accepting Islam they acquired a right to the pension, besides ceasing to pay the land tax and the poll tax.

Even in the earliest days of Islam the Arabs were not entirely devoid of military skill. Many of their tribes had been brought into relations with the Greeks and Persians, and had acquired from them some ideas of the art of war. Thus, in the time of Mohammed, the division of an army into a centre, right and left wings, vanguard and rear-guard, was understood, and the art of defending a camp or a city by entrenchments was also known. The Arabs fought on foot, on horseback, and mounted on camels. The arms of the infantry consisted of a spear, a sword, and a shield, and sometimes also of bow and arrow. The horsemen fought chiefly with the lance. For defensive arms, besides the shield, the Arab were acquainted with the helmet, the coat of mail, and the cuirass of leather covered with plates of iron. It was not till the period of the Omayyads that they began to employ military engines, such as the balista. The army was divided by tribes; and each tribe had its flag which consisted of a piece of cloth fastened to a lance. As regards the recruiting of their armies, every man able to carry arms was originally bound to render military service. 'Omar I., to whom Islam owes so many of its institutions, was the first to divide his armies into distinct corps, and to assign to each corps a fixed station. These stations were the province of Cufa, that of Basra, and afterwards the provinces of Emesa, of the Jordan, and of Palestine. These provinces afterwards became military colonies, all the inhabitants of which were bound to render military service, as distinguished from the other provinces, where service was optional, or at all events regulated by the necessities of the moment.

With the accession of Mo'awiya I. to the supreme power, the mechanism of the State was modified and became more complicated. Mo'awiya endeavoured to copy the ceremonial of foreign courts. He built himself a palace at Damascus, and set up a throne in the audience-chamber, the door of which was kept by a chamberlain (*Hajib*). When he attended the service at the mosque he occupied a choice pew with a gratuity in front (*Maksura*). When he left his palace, he was surrounded by a bodyguard (*Shorta*), commanded by a provost (*Sahib al Shorta*). Lastly, in the course of his own lifetime, he caused his son Yazid to be acknowledged as his heir-presumptive, and thus established the principle of hereditary succession, which was opposed to the spirit of Islam, and was the source of every kind of calamity. As regards the administration of the State, Mo'awiya acted at his own will and pleasure. Thus, in order to secure the service of 'Amr b. al 'As, the conqueror of Egypt, he gave up to him the revenues of that province, a part of which ought to have gone to the State. He also took an important step with regard to the annual pensions of the Beit-al-Mal, which he reduced by about two and a half per cent. The administration of the public funds in the different provinces was left to their Prefects, who were expected to pay into the public treasury only the surplus of their respective revenues. The empire had been at first divided into ten provinces: 1. Syria (subdivided into four *Jund*, or military districts); 2. Cufa, with Arabian 'Irák and Persian 'Irák; 3. Basra with Persia, Sijistán, Khorasan, Bahrain, and 'Omán; 4. Armenia; 5. Mecca; 6. Medina; 7. The Indian Marches; 8. Africa; 9. Egypt; 10. Yemen. Mo'awiya, however, subsequently thought proper to make Khorasán a separate province. Under his successors, and according to the necessities of the moment, it was sometimes reunited to the government of 'Irák. In 'Irák itself, Mo'awiya joined Basra and its dependencies to Cufa.

Under Mo'awiya the Prefects had the most extensive civil and military powers. They had even the right of the direct appointment of their Sub-Prefects. Mo'awiya, notwithstanding, thought it advisable to disconnect from their powers the offices of Judge (*Kádí*) and of Religious Official (*Imám*), which were entrusted to special functionaries named directly by the Caliph. The Caliph was, however, always at liberty to modify these arrangements at his own pleasure. Under the successors of Mo'awiya, we find certain Prefects invested at the same time with the dignities of Cadi and Imám.

It was also to Mo'awiya that the State owed the creation of a Chancery (Diwán al akhtám, or Seals-office), in which all decrees proceeding from the Caliph were registered; so that, when once issued, these decrees could not be falsified. Mo'awiya also exerted himself to ensure rapidity of communication throughout the empire, by instituting the courier post (*Barid*), in imitation of the post of the Persians and Byzantines.

After Mo'awiya we must come down to the time of 'Abd al Melik to meet with any important innovations in Moslem institutions. Before the reign of that Caliph the books of the public offices were kept by Christians and Persians, and drawn up in Greek and Persian. 'Abd al Melik ordered the exclusive employment of the Arabic language, and substituted Moslems for all the Christian and Persian clerks in the government offices. It was this same Caliph who founded the monetary system of Islam, and who was the first to strike dinárs (pieces of gold worth about ten francs), and dirhems (pieces of silver worth about a franc), with legends in Arabic. The postal system was also very much improved and developed under this prince. 'Abd al Melik was powerfully seconded by the famous Hajjáj, who was able to re-establish in 'Irák the disputed principle of obligatory military service, and who also succeeded, by skilful management, in raising the condition of agriculture in that province. Walíd, the successor of 'Abd al Melik, especially distinguished himself by the foundation of religious institutions. In his reign the mosque of Damascus, half of which had hitherto remained in the hands of the Christians, was appropriated exclusively to the Moslems, and considerably embellished. Hospitals were also established for lepers, the poor, the blind, and the sick. The pious 'Omar II. devoted all his efforts to the embellishment of the mosque of Damascus. An edict of 'Omar I. had forbidden Moslems to acquire landed property, agriculture being considered an occupation unworthy of a free man. This law had fallen into disuse; but 'Omar II. put it in force again, and declared null and void every purchase of land made by a Moslem subsequently to A.H. 100. The effects of this law might have been fatal to the empire; but it again became obsolete under the Caliphate of Hishám.

At the accession of the 'Abbásids the centre of the empire was displaced. Damascus fell from the rank of its capital to that of a provincial town; while Baghdád, a small and unknown village, became the mistress of the world. Under the first 'Abbásid the empire—not including the province of Baghdád—was divided as follows:—1. The province of Cufa. 2. The province of Basra, with the district of the Tigris, Bahrain and 'Omán; 3. Hijáz and Yaffamet. 4. Yemen. 5. Ahwáz; 6. Fársistán; 7. Khorásán. 8. The province of Mosul; 9. Mesopotamia, with Armenia and Azerbaijan; 10. Syria; 11. Egypt and the province of Africa (Spain being a dependency of Africa); 12. Sind. Al-Saffah afterwards made Palestine a distinct province, and separated Armenia and Azerbaijan from Mesopotamia. Still later, Hárún al Rashíd created a new province to the north of Syria, which received the name of 'Awásim. Each newly-conquered province was always united to that one of the older provinces to which it was nearest.

Simultaneously with the accession of the 'Abbásids, Persian influence began to preponderate. The Persian, Khálid b. Barmak, was entrusted with the administration f the finances (*Díwán al-Kharáj*) by As-Saffáh, who was lso the first Caliph who transferred the burden of public ffairs from himself to a Prime Minister (*Wazir*, whence, n European languages, the term *Vizier*). The title of Vazír was unknown to the Omayyads. The office of Prime Minister was of Persian origin. It existed till the ime of the Caliph Rádí, when that of Amír al Omará vas substituted for it. When the Caliphs had fallen nder the tutelage of the Búyids, it was the latter who hose Viziers, leaving to the Caliphs only Secretaries *Rayis al Rawasí*). Under the Seljuk Sultans the Caliphs vere again permitted to choose their own Viziers.

The institution of the office of Vizier was not the least mong the causes of the decadence of the Eastern Caliphate The 'Abbásids gradually became unaccustomed to the xercise of power and the management of affairs, and thus ost all direct influence over their subjects. Besides the Minister of Finance and the Vizier, the 'Abbásid created nother important office, that of Postmaster General (*Sahib l-Baríd*), whose duty it was to collect at a central office ll the information which arrived from the provinces and o transmit it to the Prime Minister. Thus the administrative services were greatly extended under the 'Abbásid They were subdivided as follows: 1. *Diwan al Kharaj*, or Ministry of Finance; 2. *Diwán al-Diyá'*, or Bureau of State property; 3. *Diwan al-Zimám*, Registry Office or Exchequer Office; 4. *Diwan al Jund*, or Ministry of War; 5. *Nazar al-Mazálim*, or Court of Appeal; 6. *Diwan al Mawáli wal-Ghilmán*, or Bureau of the freedmen and slaves of the Caliphs; 7. *Diwan Zimam al Nafakat*, or Office of Expenditure; 8. *Diwan al Barid*, or Office of the Posts; 9. *Diwán al-Rasáil*, or Office of Correspondence; 10. *Diwán al Tauki'*, or Office of the Imperial Seal, and of the registration of official documents. There were also offices for the despatch and reception of official documents, and for the inspection of weights and measures.

We cannot better conclude this brief summary of the institutions of the Caliphate than by giving a sketch of the organization of the State, according to the Moslem authors themselves.

The supreme chief received the title of Caliph, or of Commander of the Faithful (Amír al Mo'minín). He united in his own person all the powers of the State; his Ministers and all public functionaries acted only by virtue of a commission from him. They, like all other Moslems, were at the mercy of the Caliph, who had power of life and death over them. As spiritual chief, the Caliph was also the supreme judge in question of dogma. In theory he held his powers by the free choice of the majority of Moslems; but, when he had once received their oath of allegiance, he became their absolute master. The condition of eligibility to the Caliphate was to belong to the tribe of Koraish. In Moslem belief, the subjects of the Caliph owed him obedience and aid so long as he should fulfil his duties with exactness. These consisted in maintaining the principles of religion, in administering justice scrupulously, in defending the territory and assuring its safety, in carrying on war for the subjugation of the infidels, and in spending the public revenue in conformity to the law. If the Caliph failed in the performance of his duty, rebellion against him became lawful.

The Ministers might be absolute or dependent. If dependent, they simply executed the orders of their sovereign. If absolute, they took his place, and exercised all the powers of a Caliph except that they could not, at least in theory, designate any successor to the reigning Caliph. It was only to the Caliph himself that they were responsible for their actions.

The Prefects, when once appointed, whether by the Caliph or the Vizier, became so many petty sovereigns and, legally, owed an account of their actions only to the Caliph, or to his Prime Minister, when the latter was absolute.

The Generals were appointed either by the Caliph or by the Vizier, or lastly by the Prefect, when only a local war was in question. They were sometimes invested with very extensive powers, such as those of concluding treaties of peace, of administering justice, and of dividing the booty. The General, in his turn, appointed the officers (*Wukalá*) and under officers (*Uzzás*). It was a general order that infidels, before hostilities against them were opened, should be summoned to embrace the faith, or to submit by capitulation. The conversion of infidels was valid, even when effected sword in hand on the field of battle, and the new convert became inviolable in person and property. On the other hand, every infidel taken prisoner was sold as a slave, with his wife and children. He might even be put to death. Apostates were never to be spared, they were put to death, and their property confiscated.

Justice was administered by Cadis, appointed either by the Caliph, by the Vizier, or by the Prefect. To be eligible as a Cadi (*Kadi*), it was requisite that a man should be 1. A male and of respectable age; 2. In full possession of his mental and physical faculties; 3. A freeman; 4. A Moslem; 5. Of good moral character; 6. Acquainted with the principles of the law and their application. The duties of the Cadi were to examine into the disputes and law suits brought before him, to enforce the execution of his judgments, to name judicial commissioners to the administration of the goods of minors, madmen, etc., to administer the mortmain property of mosques and schools, (*wakf*, plural *awkaf*), to watch over the execution of wills, to inflict due legal penalties on those guilty of crimes or misdemeanours,[1] and to inspect the highways and public building. When any locality possessed no Imam, or public officiator at the mosque, it was the Cadi who performed this duty. The assistants of the Cadi were Notaries (*Shohud*), Secretaries (*Ouaama*), and Deputies (*Naiyibun*). If the Cadi died, his subordinates lost their offices *ipso facto*. On the other hand, the death of the Caliph did not nullify the powers of the Cadi, but it was necessary that he should be confirmed by the new sovereign.

The Court of Appeal (*Nazar al Mazalim*) was instituted to take cognizance of those cases in which the parties concerned appealed from the judgment of the Cadi. The sittings of this court were presided over by the Caliph in person. It was established by the Omayyad 'Abd al Melik. The last Caliph who sat in public to examine appeal cases was Mohtadi. After him a special judge was appointed to the function of president of the Court of Appeal.

Besides the Judges there were Inspectors (*Mohtasib*) charged with the police of the markets and the care of morals. The Mohtasib's duty was to take care that weights and measures were not falsified, and that buyers were not deceived as to the quality of the goods sold. He had the power of inflicting summary punishment on delinquents, but only in the case of flagrant offences. If the person charged denied the facts, he was to be brought before the Cadi. As regards morals, the Mohtasib took care that widows and divorced women should not remarry before the expiration of the legal period prescribed by the

[1] The principal offences were apostasy, neglect of religious duties, refusal to pay taxes, theft, adultery, outrages, and murder. The penalties were imprisonment, fines, corporal punishment, and death

oran. Slaves and beasts of burden were placed under is guardianship, and he protected them from ill-treatment n the part of their masters. The Mohtasib was also ommissioned to prevent public scandals, such as the sale f wine; to forbid Christians and Jews from building onses higher than those of the Faithful; and to enforce heir wearing on their dress a distinctive mark (*Ghiyár*).

Besides the offices already described, there existed three ther which require mention those of the Marshals of he Nobility (*Vikalat al Ashráf*), of the Imams, and of the mir of the Pilgrimage.

The Marshals of the Nobility were appointed in the ifferent provinces either by the Caliph, by his representative, or by the Grand Marshal. Their functions were o superintend the descendants of the family of the rophet, who formed the nobility of Islam, and to keep a egister of all the births and deaths which occurred in the amilies of the members of this nobility. In every province there were two Marshals, one for the family of 'Alí, he other for the 'Abbasides.

The duty of the Imam was to recite the public prayers n the mosque. He was appointed by the Caliph or his epresentatives, and chose in his turn his *Moeddhdhins*, who called the faithful to prayer from the tops of the minarets. In the Friday prayers it was the duty of the mam to invoke publicly the blessings of Heaven on the eigning Caliph.

The leadership of the yearly pilgrimage to the temple of Mecca was considered a great honour. It was almost always the Caliph himself or one of his near relatives who assumed the function of Amír al-Hajj. The duties of this leader of the pilgrimage were: 1. To escort the pilgrims in safety on their journeys to Mecca and back; 2. To direct the religious ceremonies during the sojourn of the pilgrims at the Holy City.

Such, briefly stated, was the organization of the Moslem State. Let us now say a few words on its religion.

We need not now recur to the object of the doctrines of Mohammed, which are treated of in their own place; but it is important to show what they became after the time of the Prophet, and what movements they aroused in Islam. The diversity of the conquered races was of itself sufficient to introduce, in the course of ages, serious modifications of the earlier religion.

But, from the very first, the Koran contained within itself the germs of discord. As long as men were content to adopt its teachings without discussion, orthodoxy might boast of maintaining itself unbroken. But as soon as they ought to examine deeply into its meaning, difficulties arose, which necessarily led the strongest minds into doubt and uncertainty. In particular, the conception of God, predestination, and free will, as presented by the

nearly as the first century of the Flight a theological school was founded at Basra, the most renowned master of which, Hasan al Basri, introduced the critical study of dogmas. His disciples, who were for the most part Persians, could not fail soon to discover that the Koran often contradicted itself, and especially that it left many dogmatic difficulties unresolved. One of the disciples of Hasan, Wasil b. 'Ata, set forth his scruples publicly, departing on three points from the orthodox doctrine. The Koran affirms the attributes of God, Wasil b. 'Ata denied them; because, he says, if the attributes of God are eternal, they constitute in some sort so many deities. We ought not therefore to affirm the existence of an attribute, that of justice, for example, but simply to affirm that God is essentially just. The Koran admits the doctrine of predestination; Wásil rejected it, as incompatible with the theory of rewards and punishments in another life, which presumes absolute free-will in man. The Koran speaks only of paradise and hell; Wásil admitted a purgatory. The sect founded by Wásil received the name of Mo'tazilite (dissident), or Kadarite, that is to say, which recognizes in man a power (*Kadar*) over his own actions. Another sect, that of the Jabarites (Partisans of *constraint*) agreed with the Mo'tazilites on the question of the attributes, but were diametrically opposed to them on that of free will. The Jabarites denied to man the slightest share in his own actions, and believed the very smallest actions of men to be the effect of predestination. The Koran, not concerning itself with the contradiction involved, admits at the same time the responsibility of man and the absolute predestination of his actions. The Jabarites rejected all responsibility, and believed that man is predestined from all eternity to paradise or to hell, for no other reason than that God has so willed it. A third sect, that of the Sifatites (Partisans of the *Attributes*), contended energetically against the two former. Keeping to the text of the sacred book, they alleged, for example, that when it is said in the Koran that God is *seated* on his throne, the expression must be taken literally. They thus fell into the grossest anthropomorphism, a doctrine which was very far from the ideas of Mohammed. In the face of these heterodox sects, the orthodox made but a poor figure. Rejecting, in the commentaries on the Koran, the explanations alike of the Mo'tazilites, of the Jabarites, and of the Sifatites, but acknowledging their inability to refute them systematically, they merely opposed to them a declaration that the Koran was neither to be explained allegorically nor always taken literally; and they concluded that, where two contradictory expressions could not be reconciled, a mystery must be admitted to exist, which it would be vain to attempt to fathom. But they did not always keep within the limits of discussion. Under the reign of 'Abd al Melik they succeeded in bringing about a persecution of the sectaries.

The Mo'tazilites, the Jabarites, and the Sifatites were dangerous only to the Church. Other sects arose, which put the State itself in peril. It will be remembered that at the time of the dispute between 'Alí and Mo'áwiya twelve thousand of the partisans of the former deserted him. These revolters, or Khárijites, originated one of the most formidable sects which ever existed in Islam. The Khárijites rejected in principle the Caliphate and the Imámate. At all events, they did not acknowledge the exclusive right of the Koraish to the Caliphate, but declared that, if it was absolutely necessary to elect a Caliph, his origin was of little consequence, provided he fulfilled his duties conscientiously and exactly. We have seen for what a length of time they kept the Omayyades in check. When they had been put down in Asia, they passed into Africa, and there made numerous proselytes among the Berbers, disposed as these were, by their independent character, to adopt with enthusiasm the principle of anarchy. The most terrible, however, of the militant sects which were formed in the bosom of Islam was that of the Shí'ites. Originally the Shí'ites were simply the partisans of 'Alí and of his descendants. In the course of time, when the whole of Persia had adopted the cause of the family of 'Alí, Shí'ism became the receptacle of all the religious ideas of the Persians, and Dualism, Gnosticism, and Manicheism, were to be seen reflected in it. Even in the lifetime of 'Alí, a converted Jew, named 'Abdallah b. Saba, had striven to introduce foreign elements into Islam. Thus, he alleged that 'Alí was to be adored as an incarnation of the Deity. These ideas, though rejected with horror by 'Alí himself, and by the greater part of the first Shí'ites, gradually made way; and all the direct descendants of 'Alí became veritable deities

the eyes of their respective partisans. A further distinction between the Shí'ites and other sects is, that they introduced the practice of giving the Koran an allegorical interpretation. This system permitted them to see in the sacred book whatever meaning they chose, and was carried out at a later date, as we shall see, by the founder of the Ismailian sect.

Under the 'Abbásids it seemed for a moment that the Shí'ite doctrines were about to triumph. We know, in fact, that the founder of that dynasty gave himself out as the heir of the house of 'Alí. But reasons of State prevailed, and the 'Abbásids, false to their first professions, on the whole supported orthodoxy. Under them reign were established the four orthodox sects Malikite, Hanafite, Shá fi'ite, and Hanbalite, which even at this day divide between them the whole Moslem world. They are named after their founders Malik, Abu Hanifa, Shafi'i, and Ibn Hanbal. These sects only differ from each other on a few points of civil and religious jurisprudence. They agree on questions of dogma. It was not, however, without difficulty that orthodoxy succeeded in obtaining the victory. Under Ma'mún and other Caliphs several doctors, as we have seen, were persecuted for believing that the Koran was the uncreated word of God. From the time of Motawakkil, however, orthodoxy remained the upper hand. Still, this reaction would not have lasted long, in face of the advance in science which marked the accession of Ma'mún to power, if the orthodox had had no other defensive weapons than material force and the assent of the majority. As philosophy made its way in Islam, thanks to the translations from Greek authors, which were made principally during the Caliphate of Ma'mun, it called forth in men's minds a movement of scientific curiosity which might have been fatal to orthodoxy. In the tenth century of our era a society of encyclopedists was formed at Basra, who, under the name of Ikhwan al Safa, or Brothers of Purity, put forth a number of very curious treatises, in which all sorts of physical and metaphysical questions were discussed and resolved in a scientific manner.[1] There is no doubt that these lucid and attractive writings would have led to a great religious revolution, if the orthodox had not understood the danger of their position, and applied themselves also to the study of philosophy, for the purpose of employing it in the service of the faith. It was thus that, towards the middle of the tenth century, a certain Abú 'l-Hasan al-Ash'arí, a descendant of that Abu Músá al-Ash'arí who had formerly acted the part of arbitrator in the dispute between Mo'áwiya and 'Alí, struck out a system in which religion appeared to be reconciled with philosophy; a system which was naturally sure to attract all commonplace minds—that is to say, the greater number. Ash'arism, or philosophic theology (Kalám), was adopted with enthusiasm by the triumphant orthodox doctors, and thenceforth pure philosophy and the heterodox sects ceased to extend their influence."[2]

The creation, however, of this philosophical theology had not done away with all dangers for orthodoxy. We have seen above that the Shí'a were divided into several sects, each holding for one of the direct descendants of 'Alí, and paying him the reverence due to a deity. One of these sects, called the Ismailian, because it acknowledged Ismá'íl, the seventh Imám or Pontiff of the posterity of 'Alí, as its chief, was the source of the greatest disorders in the Moslem empire, and was not far from being triumphant in Asia, as it was for a long time in Egypt. The Ismailians, like all the other Shí'ites, believed in the coming of a Messiah, whom they called the Mahdí, who, according to them, was one day to appear on earth in order to establish the reign of justice and equality, and to take vengeance on the oppressors of the family of 'Alí. They also believed in a God of far more elevated character than the God of the Koran, one who was unapproachable by human reason, and who had created the universe not directly, but by the intermediate action of a subordinate being, the Universal Reason, produced by an act of the divine will. The Universal Reason, in its turn, had produced the Universal Soul, which, on its part, had given birth to primitive Matter, to Space, and to Time. These five principles were the causes of the universe. Man, emanating from them, had a tendency to return towards his origin. The chief end of his being was to attain to perfect union with the Universal Reason.[3] But, left to himself, he would have been powerless to attain this end. The Universal Reason and the Universal Soul therefore became incarnate among men, in order to guide them and enlighten them. These incarnations were no other than the prophets in all ages, and, in the last period, the Imáms of the posterity of 'Alí. In the second half of the eighth century, a Persian, born in Su-tana and named 'Abdallah b. Maimun al Kaddah, nourished the dream of destroying Islam, and thought these doctrines, suitably modified, likely to be highly useful in carrying out his plans. He devised a system at once religious, philosophical, political, and social, in which, as he thought, all religions were to meet and mingle, but—and in this consisted the originality of his system—so graduated to suit different degrees of intelligence, that the whole world might become one vast Masonic association. The chief of the Ismailians, the Imam Ismá'íl, having died, 'Abdallah asserted that his son Mohammed b. Ismá'íl was to be hailed by him as the founder of this new religion, which was 'Abdallah's mission to announce to the world. Since the creation of the world, as 'Abdallah asserted, there had been six religious periods, each marked by an incarnation of the Universal Reason in the person of a prophet—Adam, Noah, Abraham, Moses, Jesus, and Mohammed had been the prophets of the six periods. Their mission had been to invite men to accept more and more perfect forms of religion. The seventh and last religion, and the most perfect of all, was that of Mohammed b. Ismá'íl, the Messiah. The Ismailians, as may be imagined, eagerly embraced the theories of 'Abdallah. In addressing the different sects and religions, 'Abdallah used special arguments with each. With the philosophers he dwelt on the philosophical principles of his doctrine. The conversion of Christians, Moslems, or Jews, was a more difficult task. 'Abdallah had established several degrees of initiation, and it was only by slow degrees, and with the most minute precautions, that he gained a mastery over the mind of the future proselyte. His curiosity was first aroused by allegorical interpretations of the Old Testament, the Gospels, and the Koran, and by proposing to him some problem which could not be solved by any of the existing religions. The solution of these problems was not to be given to him till he should have signed a paper and sworn never to reveal the mysteries with which he was made acquainted. If he took this pledge, he henceforward belonged, body and soul, to the sect, and lost his life if he made any attempt to withdraw himself from the authority of his chiefs.[4] The compact signed, the newly initiated disciple had to make a certain pecuniary sacrifice to swell the treasury of the sect. The secret

[3] It need hardly be said that all these doctrines were derived from Gnosticism and from Neo-Platonism. See on the Ismailians Guyard, *Fragments relatifs à la doctrine des Ismaéliens*, and *Un maître des Assassins au temps de Saladin*.

ounded by 'Abdallah soon had a great number of members, and its missionaries spread themselves over the Moslem world. Towards 887 A.D. an Ismailian, Hamdán, urnamed Karmat, founded the branch sect of the Carmathians, whose exploits have been recorded above. The smailian preachers also made numerous proselytes in Africa and in Egypt; and in A.D. 909, 'Obaid Alláh, a descendant of the founder of the sect, but who passed as a member of the family of 'Ali, founded the Fatimite dynasty. Under the Fatimite Caliph Hakim, a new religion sprang out of Ismailism that of the Druses, so called from its inventor, a certain Darazi or Dorzi. This religion differs little from Ismailism, except that it introduces the dogma of the incarnation of God himself on earth, under the form of the Caliph Hakim. This heresy did not survive the reign of Hakim in Egypt. When the Fatimite Caliph Mostansir ascended the throne he re-established the Ismailian belief; and the Druses, driven from Egypt, took refuge in the Lebanon, where they still exist. As for the Egyptian Ismailians, they disappeared at the time of the conquest of that province by the pious and orthodox Ayyubite Saladin. This, however, was not a final deliverance of Islam from that formidable heresy. A hundred years before the return of Egypt to orthodoxy, a Persian named Hasan Sabbah, who had been initiated into Ismailism at Cairo, in the household of the Caliph Mostansir, had founded at Alamút, on the southern shores of the Caspian Sea, that Persian branch of the Ismailians known to all the world under the name of the Assassins, who held in check the most powerful princes of Islam, till they were destroyed by the Mongol invasion. From Persia, Hasan Sabbah succeeded in filling Syria with his Assassins, and every one knows the part they played during the Crusades. The Assassins of Syria have never entirely disappeared. Even at this day some are to be found in the Lebanon. There are also some representatives of the sect in Persia, in India, and even in Zanzibar; but since the 13th century they have become completely motionless.

To conclude this sketch of the development of religious beliefs, it remains to say a few words on one of the most remarkable manifestations of Islam its mysticism, or Sufism. In principle, mysticism is rather a mode of practising religion than a distinct religion, it depends on the character of the believer's mind, and adapts itself to all dogmas.[1] It is the especial tendency of tender and dreamy spirits. Thus among the Moslems it was a woman who is considered to have founded mysticism. This woman, named Rabi'a lived in the first century of the Hijra, and was buried at Jerusalem. Her doctrine was simply the theory of Divine love. She taught that God must be loved above all things, because he alone is worthy of love, and that everything here below must be sacrificed in the hope of one day attaining to union with God. These views were foreign to the Neo Platonic ideas respecting the union of the human intellect with the Universal Reason not to have any attraction for the Gnostics, who abounded in the Shi'ite sect. Mysticism therefore made great progress in Persia, and assumed the character of a sect towards the year 200 of the Hijra. A certain Abu Sa'id b. Abi'l Khair was the first who advised his disciples to forsake the world and enter on a monastic life, in order to devote themselves exclusively to meditation and contemplation; a practice which may very probably have been borrowed from India. The disciples of Abu Sa'id wore a garment of wool (*Suf*), whence they received the name of Súfis. Súfism spread more and more in Persia, and was enthusiastically embraced by those who wished to give themselves up undisturbed to philosophical speculation. Thus, under the colour of Súfism, opinions entirely subversive of the faith of Islam were professed. In its first form Súfism was quite compatible with Moslem dogma. It was satisfied to profess a contempt for life, and an exclusive love of God, and to extol ascetic practices, as the fittest means of procuring those states of ecstasy during which the soul was supposed to contemplate the Supreme Being face to face. But by degrees, thanks to the adepts whom it drew from the ranks of heterodoxy, Súfism departed from its original purpose, and entered on discussions respecting the Divine nature, which in some cases finally led to Pantheism. The principal argument of these Pantheistic Súfis was that God being one, the creation must make a part of his being; since otherwise it would exist externally to him and would form a principle distinct from him; which would be equivalent to looking on the universe as a deity opposed to God. In the reign of Moktadir, a Persian Súfi named Hallaj, who taught publicly that every man is God, was tortured and put to death. After this the Súfis showed more caution, and veiled their teachings under oratorical phrases. Moreover, it was not all the Súfis who pushed logical results so far as to assert that man is God. They maintained that God is all, but not that all is God. Súfis exist in Persia even in our own day.

It has been explained that, under the 'Abbásids, four orthodox sects were established, and that these sects differed among themselves principally with regard to jurisprudence. The law of Islam is one of its most original creations, and can only be compared in history with the development of Roman law. The laws laid down by Mohammed in the Koran might suffice for the Arabs as long as they were confined within the bounds of the peninsula. When their empire was extended beyond these limits, it was inevitable that this first code should become insufficient for their wants. As early as the time of the first four Caliphs it was necessary, in giving judgment on the new cases which presented themselves, to have recourse to analogy, and to draw inspiration from decisions given by Mohammed, but not recorded in the Koran. These first fountains, therefore, of law were, besides the sacred book the traditions of Mohammed, or *Hadith*, the collective body of which constitutes the *Sunna*, or custom. These traditions were for a long time preserved only in the memory of the companions of Mohammed, and of those to whom they had been orally communicated. But at the beginning of the second century of the Flight the need was felt of fixing tradition in writing; and it was at Medina that the first collection of them was made. It was due to the juri-consult Málik b. Anas. He rejected from his collection with the greatest care all traditions which appeared doubtful, and only preserved about seven hundred, which he arranged in the order of the subjects. To this collection he gave the name of *Mowatta*, or Beaten Path.[2] After him came the celebrated Bokhári, the compiler of the *Sahih*,[3] in which he brought together about seven thousand traditions, carefully chosen. The *Sahih* has continued to be the standard work on the subject of tradition.

The traditions did not always supply the means of deciding difficult causes. The first four Caliphs were often obliged to have recourse to their own judgment in the administration of justice. Their decisions (*Athár*) were also collected at Medina, and helped to swell the store of juridical matter.

[3] Published at Tunis, in India, and at Cairo, A.H. 1280, with the commentary of Zarkání.

[4] Krehl's edition (Leyden) is still unfinished. An edition, fully vocalised, in 8 vols., appeared at Búlák, A.H. 1296.

In 'Iráḳ another school of law was formed, which is distinguished from that of Medina by a greater degree of independence. While the lawyers of Medina held strictly to the Koran, the traditions of the Prophet, and the Áthár, those of 'Iráḳ admitted, in addition to these, the deductive or analogical method (*Ḳiyás*), according to which it was lawful to create precedents, provided there was no departure from the spirit of the sacred book, from the traditions of the Prophet, or from the corresponding decisions of the first four Caliphs. Ibn Abi Laila, who filled the office of judge in 'Iráḳ under the caliphate of Mansur, was one of the first to apply this system. His renown, however, was eclipsed by that of his contemporary Abu Hanífa, who worked out a complete system of jurisprudence, with which his name has continued to be connected (Hanifite law). Fifty years after the death of Abú Hanífa, Sháfi'í, a pupil of Málik, appeared at Baghdád, and founded in his turn an intermediate system, in which he endeavoured to hold an equal balance between the purely traditional and the deductive method. The fourth system reputed orthodox is that of Ibn Hanbal, a pupil of Sháfi'í. Ibn Hanbal strove above all things to bring back religious observances to their primitive purity. His doctrine was a kind of puritanism. We may be supposed, each of these systems has been subsequently developed and commented on in a multitude of works, even the names of which it is impossible to enumerate. In order, however, to give some idea of what a Moslem treatise on jurisprudence is, we shall point out the principal subjects contained in it. It treats successively: 1. Of Purification (ablutions commanded by the law, purification of women, circumcision, etc.); 2. Of Prayers commanded by the law; 3. Of Funerals; 4. Of Tithe and Almsgiving; 5. Of the legal Fast; 6. Of the Pilgrimage to Mecca; 7. Of Commercial and other transactions; 8. Of Inheritance; 9. Of Marriage and Divorce; 10. Of the Faith; 11. Of Crimes and Misdemeanours; 12. Of Justice; 13. Of the Imámate or spiritual power, and of the Caliphate or temporal power. It is thus a complete code, religious, civil, penal, and governmental, that Moslem treatises on jurisprudence set before us; a code which embraces and foresees all the circumstances both of public and private life.

The development of science and literature runs parallel with the development of law. Before the time of Mohammed the Arabs had been distinguished only by a rare poetical talent. Islam was the signal for the springing up of all the sciences and of literature. While the study of the dogmas and ordinances of the Koran was producing theology and jurisprudence, the necessity of preserving the exact text of the sacred book, and of teaching the new converts the language of the Prophet, was giving birth to grammar and lexicography. The first school of grammar was established at Basra. The first attempts at grammar are generally attributed to a certain Abú 'l Aswad al-Do'alí, who was tutor to the children of Ziyád, the brother of Mo'áwiya. According, however, to some authors, the honour of having discovered the first elements of grammar ought to be attributed to a Persian, named 'Abd al Rahmán b. Hormuz. Be this as it may, a foreign influence must be recognized at the very commencement of this science. The vowel marks, for instance, were imitated from those of the Syriac. The division of the parts of speech into nouns, verbs, and particles was indirectly borrowed from Greek grammar. Yet the Moslems, once in possession of the principles of grammar, knew how to develop and apply them in an admirable manner. A perfect galaxy of grammarians arose in the track of Abú 'l Aswad; a rival school to that of Basra was established at Cufa, and grammar attained its highest degree of perfection under the first 'Abbásids; as is shown by the voluminous treatise of Sibawaihi, known under the name of *Kitáb*,[1] or the Book *par excellence*.

In lexicography, the Arabs were at first content to explain the rarer words of the Koran, of the traditions, and of the ancient poems; and to collect lists of terms applying to the same object, as the camel, the horse, the sword, etc. Thus small collections were formed, which served afterwards for the composition of dictionaries. The first dictionary properly so called, composed in Arabic, appears to have been the *Kitáb al 'Ain* of Khalil b. Ahmed al-Faráhidí, a contemporary of Harun al Rashid. After him came Jauhari, whose *Sahah* may still be consulted with profit. The celebrated Zamakhshari composed a dictionary of metaphors, under the title of *Asas al balagha*. Lastly Tha'álibí, in the 11th century of our era, drew up his *Fikh al Logha*, a work specially devoted to synonyms. The accessory branches of philology gave occasion to some important works. The ancient poems and proverbs were collected and commented on. Thus Abu Tammam formed his Anthology, called Hamása (*q. v.*), and Maidani his collection of proverbs (*Kitáb majmaʿ al amthál*). The study of poetry, with especial regard to its rhythm, led Khalil b. Ahmed, already mentioned as a grammarian and lexicographer, to the conception of prosody. He wrote the first treatise on that science, which served as a model to all subsequent writers on metres.[2] Pure literature remained confined to poetry. It was not that the Arabs were without a conception of the romance, the tale, or the novel. The adventures of Antar, the romances of Dhu 'l Himma, of Sayf al Yazan, the Thousand and one Nights, and various collections of stories and novels such as the *Fakihat al Khulafa* and the compilation of Bikri, well known by the extracts which Koreguetten has given in his Chrestomathy, all these show clearly that the Arabs were devoid of imagination, at least if, as we believe, these tales and romances were not pure and simple imitations from the Persian. It must be acknowledged, however, that these few productions do not, any more than the *Makamat* of Hamadhani and of Hariri, constitute a very important literature. The drama, the epic, the romance of character were absolutely unknown to the Arabs. Poetry, on the other hand, an endowment of the ancient Arabs, continued to live and flourish alone in the Eastern Caliphate last. We may count poets by the hundred, eminent in every department of that art: in descriptive, erotic, martial, and philosophic poetry, in ode, in satire, etc. The great collection entitled *Kitáb al Aghání*,[3] compiled by Isfahani, contains a choice of the finest poems, accompanied by very instructive notices of the poets, and of the circumstances under which they composed such and such pieces. Besides this, many Diwans, or complete editions of the works of poets, have come down to us. They bear the celebrated names of Nabigha of 'Anaza, of Tarafa, of Zohair, of 'Alkama, of Amrualkais, of Shanfara, of Labid, in the Islamic period (see Mo'allakát); of Jarír, Akhtal, Farazdak,[4] in the Omayyad period, and of Abú Nowás, Abu 'l 'Atahiya, Muslim, Motanabbi[5] (*q. v.*), and Abu 'l 'Ala[6] in the period of the 'Abbasids. And this list contains only the most illustrious names.

With the accession of the 'Abbásids to power, Moslem culture entered on a path fruitful in scientific progress. The second Caliph of that family, Mansúr, was surrounded by Syrian Christians of great learning, and equally well acquainted with the Greek, Syriac, and Arabic languages, and took advantage of their abilities to have a number of ancient books translated into Arabic. Thanks to him, the writings of Aristotle, Ptolemy, and Euclid spread a taste for science among the Moslems. The Caliph Ma'mún was one of those who most encouraged translations from the Greek. In this way the Moslems became acquainted with the most important productions of the ancient world. Plato, the works of the Alexandrian school, those of Hippocrates, Dioscorides, and Galen, were familiar to them. Through the Persians many Indian writings also became accessible to them, such as the fables of Bidpai,[1] and certain treatises on astronomy and algebra. The study of philosophy in all its branches was at one time in fashion, and, to appreciate the success with which it was cultivated in Islam, we need only recall the great names of Al Kindí, Al Farábí, Ibn Sina (Avicenna), Ibn Baja (Avempace), and Ibn Roshd (Averroes), whose teaching swayed the Middle Ages, and led to the revival of learning in the West.

In history and geography the Moslems distinguished themselves. The taste for history had been developed among them by the necessity of collecting all traditions relating to the Prophet, and by that of preserving their own genealogies. The study of geography was a result of their conquests. One of their most ancient historical productions was the biography of Mohammed, composed by Mohammed b. Ishák under the caliphate of Mansúr. Wákidí, another author of the 8th century of our era, compiled a history of the first Moslem conquests. At a later period, Baládhorí wrote on the same subject his *Kitab Futuh al Boldan*.[2] General history also became a subject of study, and, in the 9th century after Christ, Kotaiba compiled his *Kitab al Ma'arif*, a treatise on universal history. In the 10th century two great historians flourished, Tabarí and Mas'údí, by the first of whom we have a very extensive chronicle,[3] and by the second a general history, entitled *Moruj al Dhahab* (see MAS'UDI). After them came a perfect galaxy of well known historians and biographers, such as Hamza of Ispahán, Ibn al Tiktaka, Nowairi, Makrizi, Abú 'l-Fidá, Abú 'l Faraj, Al-Makín, Ibn al Athír, Soyúti, and Ibn Khalldún,[4] not to speak of many others who compiled local chronicles and histories, such as those of Mecca, Medina, Damascus, and Baghdad. As biographers, Nawawi and Ibn Khallikan[5] are celebrated. The history of physicians and philosophers, by Ibn Abi Osaibiya, deserves to be placed in the first rank, side by side with the history of religions and sects by Shahristaní.[6]

The Moslems were not less active in the study of geography. In the 9th century, Ya'kúbí wrote his *Kitab al Boldan*, or Book of Countries, in which he described the principal cities of the Moslem empire.[7] After him, Ibn Khordadbih composed his *Kitab al Masalik wal Mamálik*, or Book of Roads and Provinces, in which his principal object is to point out the different routes, and to give an account of the revenues derived from every province.[9] His contemporary Kodáma soon after published his treatise on the work of clerks, in which, after a notice of the various government offices, he gives a description of the provinces of the empire with an account of the post routes, their stages and distances, and of the revenues of each province. Ahmed b. Abi Ya'kúb al-Ya'kúbí wrote a description of Asia Minor and Ifríkiya. Several of the writings of the historian Mas'údí also afford highly valuable information on geography. To Yákút we owe a great geographical dictionary under the title of *Mo'jam al Boldan*.[10] Lastly, Istakhrí, Ibn Hankal, Mokaddasí, Berúní, Bakri, Zamakhsharí, Edrísí, and Abú 'l-Fidá have left us important treatises, narratives of travels, and geographical dictionaries.[11] Among the literature of voyages and travels we must also mention the curious *Chain of Histories* associated with the name of the merchant Soláiman and the narratives of Násiri Khosrú,[12] of Ibn Jobair,[13] and of IBN BATUTA (*q.v.*).

The sciences connected with geography, such as astronomy and cosmography, were also cultivated by the Moslems. As early as the reign of Mansúr, the Sanscrit treatise on astronomy entitled *Sidhhanta* had been translated into Arabic. Under Ma'mún, two observatories were founded, one at Baghdád, the other at Damascus, and two degrees of the terrestrial meridian were measured by order of that Caliph. Al-Kharizmí librarian to Ma'mún composed his *Kitab al Arif*, or configuration of the earth, in which the name of every place was accompanied by its latitude and longitude. Astronomical tables were drawn up by Yahya, Habash, Abú Ma'shar (Abumazar), and Al-Battání (Albategni). Treatises on astronomy were composed by Al Fargham and Al Kindí. Al Battání, of whom we have just spoken, was the author of important works on the obliquity of the ecliptic and on the precession of the equinoxes. We may mention in the last place the curious writings of Dimashki and Kazwíní on general cosmography, embracing several physical sciences.[14]

The study of mathematics was carried very far. The Moslems not only received arithmetic, geometry, trigonometry, and algebra from the Greeks and Hindus, but themselves gave a further development to those sciences. The works of Al Kháriznii served as guides to those learned men in Europe who first turned their attention to algebra in the 16th century.

The sciences of physics and chemistry, on the other hand, remained in their infancy. In physical science we can only mention a few works on Optics. As for Music, its study was limited to the practical, and though we may name the important treatise of Al Fárábí on the theory of Music, a treatise itself drawn entirely from Greek sources, we must acknowledge that Acoustics, properly so called, are not at all taken into consideration by him. Chemistry, considered as an exact science, continued unknown to the Moslems; yet they cultivated Alchemy with eagerness, in their search after the transmutation of metals, and Alchemy is the mother of Chemistry. Medicine, in the hands of the Arabs, remained such as they had borrowed it from the Greeks. As their religion forbade dissection, the Moslems were never able to rise above a rude empirism. They contented themselves with adding to the

own prescriptions, which they pretended to have received from the Prophet, those of the Greek physicians. The works of Avicenna prove this; and Ibn al-Baiṭár's treatise on the pharmacopœia also shows how small a part observation played in Arabian medicine.[1] Zoology, botany, and mineralogy made no greater progress; but they were at least among the subjects which attracted the attention of learned Moslems. The great treatise by Damíri, entitled *Ḥayát al-Ḥaiwán*, or *Life of Animals*, is of interest mainly from the legends it contains;[2] and the treatise on mineralogy by Taifashí interests us principally by the detail it gives on the origin of precious stones and the art of cutting them. It would be unjust to conclude this sketch without adding that the Moslems possess also a great number of technical treatises on the art of war, on military engines, and the Greek fire, on falconry and hunting, and on certain industries, such as those of glass, pottery, and metals. They have also written on magic, on the interpretation of dreams, and on sleight of hand. These works have as yet been very little investigated. We shall no doubt find in them interesting revelations on the history of the industrial arts, and on the history of superstition.

With an empire so vast as that of the Moslems, we may easily conceive how extensive their commerce and industry must have been. Commerce had at all times been held in honour by the Arabs. Long before the days of Mohammed, the Koraish annually sent caravans laden with all the products of Yemen, into Syria. Maritime commerce also was already flourishing in Chaldea in the 5th century of our era. The city of Ḥíra was frequented by ships coming from the Red Sea, from India, and even from China. Obolla was the emporium for the merchandise of India. It was principally thither that teakwood was brought, which served for the construction of ships and houses. Thus the Arabs, when they conquered Chaldea, found maritime commerce in full activity there, and took advantage of it. Under the 'Abbásids, Basra supplanted Ḥíra and Obolla, and became the principal port. The history of Sindibád (Sinbad the Sailor) shows how active foreign commerce was under the 'Abbásids, and with what courage the Arab sailors confronted danger. Moslem colonies were established all along the coasts of Persia and India, and Moslem voyagers did not fear to venture as far as the China Seas. On the West, the commercial movement was not less active. Caravans laden with the products of Spain left Tangier, traversed the whole of Northern Africa, and reached Syria, Arabia, and Mesopotamia. Others passed through Asia Minor, Armenia, Persia, Khorásán, and Turkestán, as far as the frontiers of China, while the route of others again was along the eastern coast of Africa, whence they brought back ivory and black slaves. Thus the silks of China, and the spices, camphor, steel, and precious woods of India, were poured into the empire, while the Moslems exported their glass, their dates, their cotton stuffs, their refined sugar, and their wrought tools to those countries. The manufacture of glass was an industry of old standing among them. The glass of Syria was celebrated, and we know that flint-glass and enamel were also made at Baghdad. Dates were cultivated principally in the neighbourhood of Basra, and also in Persia and Khúzistán. Refined sugar also came from the coast of Persia. As regards steel, the manufacture of armour and weapons was the specialty of the people of Iraḳ, of Bahrain, of 'Omán, and of Yemen. The Syrians had the credit of forging excellent sword-blades. In Syria too were made mirrors of polished steel. The weaving of various stuffs formed an important branch of industry. The striped stuffs of Yemen, and the tissues of Baghdád, Herát, Tawwaj, and Fasá, enjoyed a high repute. Damascus was renowned for the silk fabrics which have taken their name from that city. The silks of Yemen, of Egypt, and of Cufa, had also a high reputation. Tiráz produced gauze, and manufactured with gold. Egypt manufactured brocade, Armenia supplied satin. The carpet manufacture under the Caliphs had already reached the excellence which it has maintained to our own days. At that time the carpets most valued came from Farsistán and Tabaristán. Jewellery and trinkets found numerous outlets, as may be supposed. This traffic was principally carried on in the East by the Jews.

We know that the religion of the Prophet forbade any representation of the human figure. This prohibition does not appear to have been long observed, for we find that the walls of palaces and of the houses of the rich were covered with paintings. There was a school of painting at Basra, and Ibn Ḳotaiba gives us the names of two painters of high celebrity in that art, Ibn 'Azíz and Ḳosair.

The manufacture of paper was carried on very extensively, a fact which is easily explained when we think of the literary activity of the Moslems. The Arabs originally used parchments. For this, after the conquest of Egypt, they substituted papyrus, which was itself supplanted by paper when the Arabs had opened communications with China. Paper mills were established in several of the provinces and at Baghdad itself. Simultaneously with the appearance of this precious substance, the art of binding became one of the most flourishing industries, as did also the trades of the shoemaker, the saddler, and the dyer, etc. etc. Retail commerce, lastly, underwent the distribution of the products of agriculture and industry. In almost all the cities of the empire markets were held, where the fruiterer and grocer (*Bakkál*), the butcher (*Ḳassáb*), the armourer (*Sirádj*), the bookseller (*Warráḳ*), and the druggist and perfumer (*'Aṭṭár*), offered their wares for sale.[3] (ST. G.)

PART III. THE KORAN.

The Koran (Ḳo'rán) is the foundation of Islam. It is the sacred book of more than a hundred millions of men, some of them nations of immemorial civilization, by all whom it is regarded as the immediate word of God. And since the use of the Koran in public worship, in schools and otherwise, is much more extensive than, for example, the reading of the Bible in most Christian countries, it has been truly described as the most widely-read book in existence. This circumstance alone is sufficient to give it an urgent claim on our attention, whether it suit our taste and fall in with our religious and philosophical views or not. Besides, it is the work of Mohammed, and as such is fitted to afford a clue to the spiritual development of that most successful of all prophet- and religious personalities. It must be owned that the first perusal leaves on a European an impression of chaotic confusion, not that the book is so very extensive, for it is not quite so large as the New Testament. This impression can in some degree be modified only by the application of a critical analysis with the assistance of Arabian tradition.

To the faith of the Moslems, as has been said, the Koran is the word of God, and such also is the claim which the book itself advances. For except in sur. i. which

[1] The treatise has been translated into French by Dr. Leclerc.

prayer for men and some few passages where Mohammed (vi. 104, 114; xxvii. 93; xlii. 8), or the angels (xix. 65; xxxvii. 164 *sqq.*), speak in the first person without the intervention of the usual imperative "say" (sing. or pl.), the speaker throughout is God, either in the first person singular, or more commonly the plural of majesty "we." The same mode of address is familiar to us from the prophets of the Old Testament, the human personality disappears, in the moment of inspiration, behind the God by whom it is filled. But all the greatest of the Hebrew prophets fall back speedily upon the unassuming human "I," while in the Koran the divine "I" is the stereotyped form of address. Mohammed, however, really felt himself to be the instrument of God, this consciousness was no doubt brighter at his first appearance than it afterwards became, but it never entirely forsook him. We might therefore readily pardon him for giving out, not only the results of imaginative and emotional excitement, but also many expositions or decrees which were the outcome of cool calculation, as the word of God, if he had only attained the pure moral altitude which in an Isaiah or a Jeremiah fills us with admiration after the lapse of ages.

The rationale of revelation is explained in the Koran itself as follows. In heaven is the original text ("the mother of the book," xliii. 3, "a concealed book," lvi. 77, "a well guarded tablet," lxxxv. 22). By a process of "sending down" (*tanzīl*), one piece after another was communicated to the Prophet. The mediator was an angel, who is called sometimes the "Spirit" (xxvi. 193), sometimes the "holy Spirit" (xvi. 104), and at a later time "Gabriel" (ii. 91). This angel dictates the revelation to the Prophet, who repeats it after him, and afterwards proclaims it to the world (lxxxvii. 6, etc.). It is plain that we have here a somewhat crude attempt of the Prophet to represent to himself the more or less unconscious process by which his ideas arose and gradually took shape in his mind. It is no wonder if in such control of imagery the details are not always self-consistent. When, for example, this heavenly archetype is said to be in the hand of an exalted "scribe" (lxxx. 13 *sqq.*), this seems a transition to a quite different set of ideas, namely, the books of fate, or the record of all human actions—conceptions which are actually found in the Koran. It is to be observed, at all events, that Mohammed's transcendental idea of God, as a Being exalted altogether above the world, excludes the thought of direct intercourse between the Prophet and God.

It is an explicit statement of the Koran that the sacred book was revealed ("sent down") by God, not all at once, but piecemeal and gradually (xxv. 34). This is evident from the actual composition of the book, and is confirmed by Moslem tradition. That is to say, Mohammed issued his revelations in fly leaves of greater or less extent. A single piece of this kind was called either, like the entire collection, *Koran*, *i.e.* "recitation" or "reading," or *kitāb*, "writing," or *sūra*, which is the late Hebrew *shūra*, and means literally "series." The last became, in the lifetime of Mohammed, the regular designation of the individual section as distinguished from the whole collection; and accordingly it is the name given to the separate chapters of the existing Koran. These chapters are of very unequal length. Since many of the shorter ones are undoubtedly complete in themselves, it is natural to assume that the longer, which are sometimes very comprehensive, have arisen from the amalgamation of various originally distinct revelations. This supposition is favoured by the numerous traditions which give us the circumstances under which this or that short piece, now incorporated in a larger section, was revealed; and also by the fact that the connection of thought in the present sūras often seems to be interrupted. And in reality many pieces of the long sūras have to be severed out as originally independent; even in the short ones parts are often found which cannot have been there at first. At the same time we must beware of carrying this sifting operation too far,—as Nöldeke now believes himself to have done in his earlier works, and as Sprenger also sometimes seems to do. That some sūras were of considerable length from the first is seen, for example, from xii., which contains a short introduction, then the history of Joseph, and then a few concluding observations, and is therefore perfectly homogeneous. In like manner, xx., which is mainly occupied with the history of Moses, forms a complete whole. The same is true of xviii., which at first sight seems to fall into several pieces; the history of the seven sleepers, the grotesque narrative about Moses, and that about Alexander "the Horned," are all connected together, and the same rhyme runs through the whole sūra. Even in the separate narrations we may observe how readily the Koran passes from one subject to another, how little care is taken to express all the transitions of thought, and how frequently clauses are omitted, which are almost indispensable. We are not at liberty, therefore, in every case where the connection in the Koran is obscure, to say that it is really broken, and set it down as the clumsy patchwork of a later hand. Even in the old Arabic poetry such abrupt transitions are of very frequent occurrence. It is no uncommon for the Koran, after a new subject has been entered on, to return gradually or suddenly to the former theme, a proof that there at least separation is not to be thought of. In short, however imperfectly the Koran may have been redacted, in the majority of cases the present sūras are identical with the originals.

How these revelations actually arose in Mohammed's mind is a question which it is almost as idle to discuss as it would be to analyse the workings of the mind of a poet. In his early career, sometimes perhaps in its later stages also, many revelations must have burst from him in uncontrollable excitement, so that he could not possibly regard them otherwise than as divine inspirations. We must bear in mind that he was no cold systematic thinker, but an Oriental visionary, brought up in crass superstition and without intellectual discipline; a man whose nervous temperament had been powerfully worked on by ascetic austerities, and who was all the more irritated by the opposition he encountered, because he had little of the heroic in his nature. Filled with his religious ideas and visions, he might well fancy he heard the angel bidding him recite what was said to him. There may have been many a revelation of this kind which no one ever heard but himself, as he repeated it to himself in the silence of the night (lxxiii. 1). Indeed the Koran itself admits that he forgot some revelations (lxxxvii. 7). But by far the greatest part of the book is undoubtedly the result of deliberation, touched more or less with emotion, and animated by a certain rhetorical rather than poetical glow. Many passages are based upon purely intellectual reflection. It is said that Mohammed occasionally uttered such a passage immediately after one of those epileptic fits which not only his followers, but (for a time at least) he himself also, regarded as tokens of intercourse with the higher powers. If this be the case, it is impossible to say whether the trick was in the utterance of the revelation or in the fit itself.

How the various pieces of the Koran took literary form is uncertain. Mohammed himself, so far as we can discover, never wrote down anything. The question whether he could read and write has been much debated among Moslems, unfortunately more with dogmatic arguments and spurious traditions than authentic proofs. At present one is inclined to say that he was not altogether ignorant of these arts, but that from want of practice he found

nvenient to employ some one else whenever he had anything to write. After the flight to Medina (A.D. 622) we e told that short pieces—chiefly legal decisions—were ken down immediately after they were revealed, by an lherent whom he summoned for the purpose; so that othing stood in the way of their publication. Hence it probable that in Mecca, where the art of writing was mmoner than in Medina, he had already begun to have s oracles committed to writing. That even long portions the Koran existed in written form from an early date ay be pretty safely inferred from various indications; pecially from the fact that in Mecca the Prophet had used insertions to be made, and pieces to be erased in s previous revelations. For we cannot suppose that he new the longer súras by heart so perfectly that he was ble after a time to lay his finger upon any particular assage. In some instances, indeed, he may have relied o much on his memory. For example, he seems to have ccasionally dictated the same súra to different persons in ightly different terms. In such cases, no doubt, he may ave partly intended to introduce improvements, and o ong as the difference was merely in expression, without ffecting the sense, it could occasion no perplexity to his llowers. None of them had literary pedantry enough question the consistency of the divine revelation on hat ground. In particular instances, however, the difference of reading was too important to be overlooked hus the Koran itself confesses that the unbelievers cast up as a reproach to the Prophet that God sometimes ubstituted one verse for another (xvi. 103). On one ccasion, when a dispute arose between two of his own llowers as to the true reading of a passage which both ad received from the Prophet himself, Mohammed is said have explained that the Koran was revealed in seven orms. In this apparently gemmæ dictum seven stand of ourse, as in many other cases, for an indefinite but limited umber. But one may imagine what a world of trouble has cost the Moslem theologians to explain the saying accordance with their dogmatic beliefs. A great number of explanations are current, some of which claim the uthority of the Prophet himself, as, indeed, fictitious tterances of Mohammed play throughout a conspicuous art in the exegesis of the Koran. One very favourite, ut utterly untenable interpretation is that the "seven orms" are seven different Arabic dialects.

When such discrepancies came to the cognisance of Mohammed it was doubtless his desire that only one of he conflicting texts should be considered authentic; only e never gave himself much trouble to have his wish arried into effect. Although in theory he was an upholder of verbal inspiration, he did not push the doctrine o its extreme consequences; his practical good sense did ot take these things so strictly as the theologians of ater centuries. Sometimes, however, he did suppress whole sections or verses, enjoining his followers to efface or forget them, and declaring them to be "abrogated." A very remarkable case is that of the two verses in lii., when he had recognised three heathen goddesses as exalted beings, possessing influence with God. (*Supra*, p. 549.)

So much for abrogated readings; the case is somewhat different when we come to the abrogation of laws and directions to the Moslems, which often occurs in the Koran. There is nothing in this at variance with Mohammed's idea of God. God is to him an absolute despot, who declares a thing right or wrong from no inherent necessity but by his arbitrary fiat. This God varies his commands at pleasure, prescribes one law for the Christians, another for the Jews, and a third for the Moslems; nay, he even changes his instructions to the Moslems when it pleases him. Thus, for example, the Koran contains very different directions, suited to varying circumstances, as to the treatment which idolaters are to receive at the hands of believers. But Mohammed showed no anxiety to have these superseded enactments destroyed. Believers could be in no uncertainty as to which of two contradictory passages remained in force; and they might still find edification in that which had become obsolete. That later generations might not so easily distinguish the "abrogated" from the "abrogating" did not occur to Mohammed, whose vision, naturally enough, seldom extended to the future of his religious community. Current events were invariably kept in view in the revelations. In Medina it called forth the admiration of the Faithful to observe how often God gave them the answer to a question whose settlement was urgently required at the moment. The same naïveté appears in a remark of the Caliph 'Othman about a doubtful case: "If the Apostle of God were still alive, methinks there had been a Koran passage revealed on this point." Not unfrequently the divine word was found to coincide with the advice which Mohammed had received from his most intimate disciples. "Omar was many a time of a certain opinion," says one tradition, "and the Koran was then revealed accordingly."

The contents of the different parts of the Koran are extremely varied. Many passages consist of theological or moral reflections. We are reminded of the greatness, the goodness, the righteousness of God as manifested in Nature, in history, and in revelation through the prophets, especially through Mohammed. God is magnified as the One, the All powerful. Idolatry and all deification of created beings such as the worship of Christ as the Son of God, are unsparingly condemned. The joys of heaven and the pains of hell are depicted in vivid sensuous imagery, as is also the terror of the whole creation at the advent of the last day and the judgment of the world. Believers receive general moral instruction, as well as directions for special circumstances. The lukewarm are rebuked, the enemies threatened with terrible punishment, both temporal and eternal. To the sceptical the truth of Islam is held forth and a certain, not very cogent, method of demonstration predominates. In many passages the sacred book falls into a diffuse preaching style, others seem more like proclamations or general orders. A great number contain ceremonial or civil laws, or even special commands to individuals down to such matters as the regulation of Mohammed's harem. In not a few, definite questions are answered which had actually been propounded to the Prophet by believers or infidels. Mohammed himself too, repeatedly receives directions, and does not escape an occasional rebuke. One súra (i.) is a prayer, two (cxiii., cxiv.) are magical formulæ. Many súras treat of a single topic, others embrace several.

From the mass of material comprised in the Koran and its account we have given it (far from exhaustive) we should select the histories of the ancient prophets and saints as possessing a peculiar interest. The purpose of Mohammed is to show from these histories how God in former times had rewarded the righteous and punished their enemies. For the most part the old prophets only serve to introduce a little variety in point of form, for they are almost in every case facsimiles of Mohammed himself. They preach exactly like him, they have to bear the very same charges against their opponents, who on their part behave exactly as the unbelieving inhabitants of Mecca. The Koran even goes so far as to make Noah contend against the worship of certain tabu gods, enumerated by name, who were worshipped by the Arabs of Mohammed's time. In an address which is put in the mouth of Abraham (xxvi. 75 *sqq.*) the reader quite forgets that it is Abraham, and not Mohammed (or God himself) who

peaking. Other narratives are intended rather for amuse-
ment, although they are always well seasoned with edifying
hrases. It is no wonder that the godless Koraishites
hought these stories of the Koran not nearly so entertain
ng as those of Rostam and Espandiar related by Nadr the
on of Harith, who had learned on the Euphrates the
eroic mythology of the Persians. But the Prophet was
o exasperated by this rivalry that when Nadr fell into his
ower after the battle of Bedr, he caused him to be executed;
although in all other cases he readily pardoned his fellow
ountrymen.

The stories are chiefly about Scripture characters,
pecially those of the Old Testament. But the deviations
rom the Biblical narratives are very marked. Many of
he alterations are found in the legendary anecdotes of the
ewish Haggada and the New Testament Apocrypha, but
many more are due to mis-conceptions such as only a listener
not the reader of a book) could fall into. The most ignor-
ant Jew could never have mistaken Haman (the minister
f Ahasuerus) for the minister of Pharaoh, or identified
braham's sister of Moses with Mary (Miriam) the
other of Christ. In addition to such misconceptions
here alteration, some of them very
rotesque, due to Mohammed himself. For instance, in
is ignorance of everything out of Arabia, he makes the
ertility of Egypt where rain is almost never seen and never
issed depend on rain instead of the inundations of the
Nile (xii. 49). It was through the Jews also that he
orrowed his account of Alexander "the Horned"; an
pithet which is to be explained, after old Hottinger, from
he great multitude of coins where Alexander is represented
with the ram's horn of Ammon. Besides Jewish and
Christian history there are a few about old Arabian
prophets. In these he seems to have handled his materials
even more freely than in the others.

The opinion has already been expressed that Mohammed
did not make use of written Coincidences and
divergences alike can always be accounted for by oral com-
munications from Jews who knew a little and Christians
who knew next to nothing. Even in
where we can trace direct resemblances to the text of the
Old Testament (comp. xxi. 105 with Ps. xxxvii. 29, i. 5 with
Ps. xxxvii. 11) or the New (comp. vi. 18 with Luke xvi. 24,
xlvi. 19 with Luke xvi. 25), there is nothing more than
might readily have been picked up in conversation with
any Jew or Christian. In Medina, where he had the
opportunity of becoming acquainted with Jews of some
culture, he learned some things out of the Mishna, *e.g.*
v. 35 corresponds almost word for word with Mishna *Sanh.*
v. 5, compare also ii. 183 with Mishna *Ber.* i. 2. That
here are only cases of oral communication will be admitted
by no one with the slightest knowledge of the circum-
stances. Otherwise we might even conclude that Moham-
med had studied the Talmud; *e.g.* the regulation as to
ablution by rubbing with sand, where water cannot be
obtained (iv. 46), corresponds to a talmudic ordinance
(*Ber.* 15 *a*). Of Christianity he can have been able to learn
very little even in Medina, as may be seen from the absurd
travesty of the institution of the Eucharist in v. 112 *sqq.*
For the rest, it is highly improbable that before the Koran
any real literary production anything that could be
strictly called a book existed in the Arabic language.

In point of style and artistic effect, the different parts
of the Koran are of very unequal value. An unprejudiced
and critical reader will certainly find very few passages
where his aesthetic susceptibilities are thoroughly satisfied.
But he will often be struck especially in the older pieces,
by a wild force of passion, and a vigorous, if not rich,
imagination. Descriptions of heaven and hell, and allu
sions to God's working in Nature, not unfrequently show
a certain amount of poetic power. In other places als
the style is sometimes lively and impressive; though it
rarely indeed that we come across such strains of touchin
simplicity as in the middle of xciii. The greater part of th
Koran is decidedly prosaic; much of it indeed is stiff in style
Of course, with such a variety of material, we cannot expec
every part to be equally vivacious, or imaginative, o
poetic. A decree about the right of inheritance, or
point of ritual, must necessarily be expressed in prose,
it is to be intelligible. No one complains of the civil law
in Exodus or the sacrificial ritual in Leviticus, becaus
they want the fire of Isaiah or the tenderness of Deute
onomy. But Mohammed's mistake consists in persisten
and slavish adherence to the semi-poetic form which h
had at first adopted in accordance with his own taste an
that of his hearers. For instance, he employs rhyme i
dealing with the most prosaic subjects, and thus produce
the disagreeable effect of incongruity between style an
matter. It has to be considered, however, that many o
those sermonizing pieces which are so tedious to us, espec
ally when we read two or three in succession (perhaps i
a very inadequate translation), must have had a quit
different effect when recited under the burning sky an
on the barren soil of Mecca. There, thoughts abou
God's greatness and man's duty, which are familiar to u
from childhood, were all new to the hearers—it is heare
we have to think of in the first instance, not readers—t
whom, at the same time, every allusion had a meanin
which often escapes our notice. When Mohammed spok
of the goodness of the Lord in creating the clouds, an
bringing them across the cheerless desert, and pourin
them out on the earth to restore its rich vegetation, th
must have been a picture of thrilling interest to the Arab
who are accustomed to see from three to five years elap
before a copious shower comes to clothe the wilderne
once more with luxuriant pastures. It requires an effo
for us, under our clouded skies, to realize in some degr
the intensity of that impression.

The fact that scraps of poetical phraseology are sp
cially numerous in the earlier súras, enables us to unde
stand why the prosaic mercantile community of Mec
regarded their eccentric townsman as a "poet," or even
"possessed poet." Mohammed himself had to disclai
such titles, because he felt himself to be a divinely-inspire
prophet; but we too, from our standpoint, shall ful
acquit him of poetic genius. many other predom
nantly religious characters, he had no appreciation of poet
beauty; and if we may believe one anecdote related
him, at a time when every one made verses he affecte
ignorance of the most elementary rules of prosody. Hen
the style of the Koran is not poetical but rhetorical; an
the powerful effect which some portions produce on us
gained by rhetorical means. Accordingly the sacred boo
has not even the artistic form of poetry; which, amon
the Arabs, includes a stringent metre, as well as rhym
The Koran is never metrical, and only a few exceptional
eloquent portions fall into a sort of spontaneous rhythm. O
the other hand, the rhyme is regularly maintained; althoug
especially in the later pieces, after a very slovenly fashio
Rhymed prose was a favourite form of composition amon
the Arabs of that day, and Mohammed adopted it; b
it imparts a certain sprightliness to some passages,
proves on the whole a burdensome yoke. The Mosle
themselves have observed that the tyranny of the rhy
often makes itself apparent in derangement of the ord
of words, and in the choice of verbal forms which wou
not otherwise have been employed; *e.g.* an imperfect inste
of a perfect. In one place, to save the rhyme, he ca
Mount Sinai *Sinín* (xcv. 2) instead of *Sináa* (xxiii. 20
in another Elijah is called *Ilyásín* (xxxvii. 130) instead

lyás (vi. 85; xxxvii. 123). The substance even is modified to suit exigencies of rayme. Thus the Prophet would carcely have fixed on th unusual number of *eight* angels ound the throne of God (lxix. 17) if the word *thamánigah*, eight," had not happened to fall in so well with the hyme. And when lv. speaks of *two* heavenly gardens, ach with *two* fountains and *two* kinds of fruit, and again f *two* similar gardens, all this is simply because the dual ermination (*án*) corresponds to the syllable that controls he rhyme in that whole súra. In the later pieces, Mohammed often inserts edifying remarks, entirely out of eeping with the context, merely to complete his rhyme. n Arabic it is such an easy thing to accumulate masses f words with the same termination, that the gross neglience of the rhyme in the Koran is doubly remarkable. One may say that this is another mark of the Prophet's want of mental training, and incapacity for introspective riticism.

On the whole, while many parts of the Koran undoubtedly have considerable rhetorical power even over an unbelieving reader, the book, aesthetically considered, s by no means a first-rate performance. To begin with what we are most competent to criticize, let us look at some of the more extended narratives. It has already been noticed how vehement and abrupt they are where they ought to be characterized by epic repose. Indispensable links, both in expression and in th events, are often omitted, so that to understand these histories is sometimes far easier for us than for those who heard them first, because we know most of them from better sources. Along with this, there is a great deal of superfluous verbiage; and nowhere do we find a steady advance in the narration. Contrast in these respects the history of Joseph (xii.) and its glaring improprieties, with the admirably-conceived and admirably executed story in Genesis. Similar faults are found in the non-narrative portions of the Koran. The connexion of ideas is extremely loose, and even the syntax betrays great awkwardness. Anacoluthia are of frequent occurrence, and cannot be explained as conscious literary devices. Many sentences begin with a "when" or "on the day when" which seems to hover in the air, so that the commentators are driven to supply a "think of this" or some such ellipsis. Again, there is no great literary skill evinced in the frequent and needless harping on the same words and phrases; in xviii., for example, "till that" (*hatta idhá*) occurs no fewer than eight times. Mohammed in short, is not in any sense a master of style. This opinion will be endorsed by any European who reads through the book with an impartial spirit and some knowledge of the language, without taking into account the tiresome effect of its endless iterations. But in the every pious Moslem such a judgment will sound almost as shocking as downright atheism or polytheism. Among the Moslems, the Koran has always been on as the most perfect model of style and language. This feature of it is in their dogmatic the greatest of all miracles, the incontestable proof of its divine origin. Such a view on the part of men who knew Arabic infinitely better than the most accomplished European Arabist will ever do, may well startle us. In fact, the Koran boldly challenged its opponents to produce ten súras, or even a single one, like those of the sacred book, and they never did so. That, to be sure, on calm reflexion, is not so very surprising. Revelations of the kind which Mohammed uttered, no unbeliever could produce without making himself a laughing-stock. However little real originality there is in Mohammed's doctrines, as against his own country he was thoroughly original, even in the form of his oracles. To compose such revelations at will was beyond the power of the most expert literary artist; it would have required either a prophet, or a shameless impostor. And if such a character appeared *after* Mohammed, still he could never be anything but an imitator, like the false prophets who arose about the time of his death and afterwards. That the adversaries should produce any sample whatsoever of poetry or rhetoric equal to the Koran is not at all what the Prophet demands. In that case he would have been put to shame, even in the eyes of many of his own followers, by the first poem that came to hand. Nevertheless, it is on a false interpretation of this challenge that the dogma of the incomparable excellence of the style and diction of the Koran is based. The result has been accomplished by dogmatic prejudice, which is quite capable of working other miracles besides turning a defective literary production into an unrivalled masterpiece in the eyes of believers. This view once accepted, the next step was to find everywhere evidence of the perfection of the style and language. And if here and there scarcely a doubt, there was among the old Moslems a lover of poetry who had his difficulties about the doctrine, he had to beware of uttering an opinion which might have cost him his head. We know of at least one rationalistic theologian who defined the dogma in such a way that we can see he did not believe it (Shahrastání, p. 39). The truth is, it would have been a miracle indeed if the style of the Koran had been perfect. For although there was at the time a recognized poetical style, already degenerating into mannerism, a prose style did not exist. All beginnings are difficult, and it can never be counted a serious charge against Mohammed that his book, the first prose work of a high order in the language, is inferior to the awkwardness of the beginner. And further, we must always remember that entertainment and aesthetic effect were the most subsidiary objects. The great aim was persuasion and conversion; and, say what we will, that aim has been realized on the most imposing scale.

Mohammed repeatedly calls attention to the fact that the Koran is not written, like other sacred books, in a strange language, but in Arabic, and therefore intelligible to all. At that time, along with foreign ideas, many foreign words had crept into the language, especially Aramaic terms for religious conceptions of Jewish or Christian origin. Some of these had already passed into general use, while others were confined to a more limited circle. Mohammed, who could not fully new ideas the common language of his countrymen, but had frequently to find out new terms for himself, made free use of such Jewish and Christian words, as was done though perhaps in a smaller extent, by certain thinkers and poets of that age who had more or less risen above the level of heathenism. In Mohammed's case this is the wonderful, because he was indebted to the instruction of Jews and Christians whose Arabic as the Koran pretty clearly intimates with regard to one them was by defective. Nor is it very surprising to find that his use of these words is sometimes as much at fault as his comprehension of the histories which he learned from the same people that applies Aramaic expressions as incorrectly as many uneducated persons now employ words derived from the French. Thus, *furkán* means really "redemption," but Mohammed (misled by the Arabic meaning of the root فرق "to decide") uses it for "revelation." *Millat* is properly "Word" but in the Koran "religion." *Ilâhun* (lxxxvi. 18, 19) is apparently the Hebrew name of God, *Elyon* "the Most High"; Mohammed uses it of a heavenly host (see S. Fraenkel, *De vocabulis in antiquis Arabum carminibus et in Corano peregrinis*, Leyden, 1880, p. 23). So again the word *mathání* is, as Geiger has conjectured,

regular plural of the Aramaic *mathnithá*, which is the same as the Hebrew *Mishna*, and denotes, in Jewish usage, a legal decision of some of the ancient Rabbins. But in the Koran "the seven *Mathání*" (xv. 87) are probably the seven verses of sura 1., so that Mohammed appears to have understood it in the sense of "saying," or "sentence" (comp. xxxix. 24). Words of Christian origin are less frequent in the Koran. It is an interesting fact that of these a few have come over from the Abyssinian, such as *hawárayún*, "apostles," *má'ida*, "table," and two or three others; these all make their first appearance in sura of the Medina period. The word *shaitán*, "Satan," which was likewise borrowed, at least in the first instance, from the Abyssinian, had probably been already introduced into the language. Sprenger has rightly observed that Mohammed makes a certain parade of these foreign terms, as of other peculiarly constructed expressions; in this he followed a favourite practice of contemporary poets. It is the tendency of the imperfectly educated to delight in out of the way expressions, and on such minds they readily produce a remarkably solemn and mysterious impression. This was exactly the kind of effect that Mohammed desired, and to secure it he seems even to have invented a few odd vocables, as *abáribu* (lxix. 36), *ghislin* (lxxviii. 7, 8), *ta'ísan* (lxxxix. 27), and *salsabíl* (lxxvi. 18). But, of course, the necessity of enabling his hearers to understand ideas which they must have found sufficiently novel in themselves, imposed tolerably narrow limits on such eccentricities.

The constituents of our present Koran belong partly to the Mecca period (before 622 A.D.), partly to the period commencing with the flight to Medina (from the autumn of 622 to 8th June 632). Mohammed's position in Medina was entirely different from that which he had occupied in his native town. In the former he was from the first the leader of a powerful party, and gradually became the autocratic ruler of Arabia; in the latter he was only the despised preacher of a small congregation. This difference, as was to be expected, appears in the Koran. The Medina pieces, whether entire suras or isolated passages interpolated in Meccan suras, are accordingly pretty broadly distinct, as to their contents, from those composed in Mecca. In the great majority of cases there can be no doubt whatever whether a piece first saw the light in Mecca or in Medina; and for the most part the internal evidence is borne out by Moslem tradition. And now the revelations given in Medina frequently take notice of events about which we have pretty accurate information, and whose dates are at least approximately known, we are often in a position to fix their date with at any rate considerable certainty, here again tradition renders valuable assistance. Even with regard to the Medina passages, however, a great deal remains uncertain, partly because the allusions to historical events and circumstances are generally rather obscure, partly because traditions about the occasion of the revelation of the various pieces are often fluctuating, and often rest on mere understanding or arbitrary conjecture. But at all events it is far easier to arrange in some sort of chronological order the Medina suras than those composed in Mecca. There is, indeed, one tradition which professes to furnish a chronological list of all the suras. But not to mention that it occurs in several divergent forms, and that it takes no account of the fact that our present suras are partly composed of pieces of different dates, it contains so many suspicious or undoubtedly false statements, that it is impossible to attach any great importance to it. Besides, it is *a priori* unlikely that a contemporary of Mohammed could have drawn up such a list; and if any one had made the attempt, he would have found it almost impossible to obtain reliable information as to the order of the earlier Meccan suras. We have in this list no genuine tradition, but rather the lucubrations of an undoubted conscientious Moslem critic, who may have lived about a century after the Flight.

Among the revelations put forth in Mecca there is a considerable number of (for the most part) short suras which strike every attentive reader as being the oldest. They are in an altogether different strain from many others, and in their whole composition they show least resemblance to the Medina pieces. It is no doubt conceivable—as Sprenger supposes—that Mohammed might have returned at intervals to his earlier manner; but since this group possesses a remarkable similarity of style, and since the gradual formation of a different style is on the whole an unmistakable fact, the assumption has little probability, and we shall therefore abide by the opinion that these form a distinct group. At the opposite extreme from them stands another cluster, showing quite obvious affinities with the style of the Medina suras, which must therefore be assigned to the later part of the Prophet's work in Mecca. Between these two groups stand a number of other Meccan suras, which in every respect mark the transition from the first period to the third. It need hardly be said that the three periods which were first distinguished by Professor Weil are not separated by sharp lines of division. With regard to some suras, it may be doubtful whether they ought to be reckoned among the middle group, or with one or other of the extremes. And it is altogether impossible, within these groups, to establish even a probable chronological arrangement of the individual revelations. In default of clear allusions to well known events, or events whose date can be determined, we might indeed endeavour to trace the psychological development of the Prophet by means of the Koran and arrange its parts accordingly. But in such an undertaking one is always apt to take subjective assumptions or mere fancies for established data. Good traditions about the origin of the Meccan revelations are not very numerous. In fact the whole history of Mohammed previous to the Flight is so imperfectly related that we are not even sure in what year he appeared as a prophet. Probably it was in A.D. 610; it may have been somewhat earlier, but scarcely later. If, as one tradition says, xxx. 1–5 ("The Romans are overcome in the nearest neighbouring land") refers to the defeat of the Byzantines by the Persians, not far from Damascus, about the spring of 614, it would follow that the third group, to which this passage belongs, covers the greater part of the Mecca period. And it is not in itself unlikely that the passionate vehemence which characterizes the first group was of short duration. Nor is the assumption contradicted by the tolerably well attested, though far from incontestable statement, that when 'Omar was converted (A.D. 615 or 616) xx., which belongs to the second group, already existed in writing. But the reference of xxx. 1 *sq.* to this particular battle is by no means so certain that positive conclusions can be drawn from it. It is the same with other allusions in the Meccan suras to occurrences whose chronology can be partially ascertained. It is better, therefore, to rest satisfied with a merely relative determination of the order. Even the three great clusters of Meccan revelation

In the pieces of the first period the convulsive excitement of the Prophet often expresses itself with the utmost vehemence. He is so carried away by his emotion that he cannot choose his words; they seem rather to burst from him. Many of these pieces remind us of the oracles of the old heathen soothsayers, whose style is known to us from imitations, although we have perhaps not a single genuine specimen. Like those other oracles, the suras of this period, which are never very long, are composed

ort sentences with tolerably pure but rapidly-changing ymes. The oaths, too, with which many of them begin, re largely used by the soothsayers. Some of these ths are very uncouth and hard to understand, some of em perhaps were not meant to be understood, for indeed sorts of strange things are met with in these chapters. re and there Mohammed speaks of visions, and appears n to see angels before him in bodily form. There are ne intensely vivid descriptions of the resurrection and e last day which must have exercised a demoniac power er men who were quite unfamiliar with such pictures. ther pieces paint in glowing colours the joys of heaven d the pains of hell. However, the suras of this period e not all so wild as these; and those which are conceived a calmer mood appear to be the oldest. Yet, one must peat, it is exceedingly difficult to make out any strict ronological sequence. For instance, it is by no means rtain whether the beginning of xcvi. is really what a dely-circulated tradition calls it, the oldest part of the ole Koran. That tradition goes back to the Prophet vourite wife 'Áisha; but as she was not born at the ne when the revelation is said to have been made, it n only contain at the best what Mohammed told her ars afterwards, from his own not very clear recollection, th or without fictitious addition. And, moreover, ere are other pieces mentioned by others as the oldest any case xcvi. 1 *sqq.* is certainly very early. Accord g to the traditional view, which appears to be correct, treats of a vision in which the Prophet receives an junction to recite a revelation conveyed to him by the gel. It is interesting to observe that here already two ings are brought forward as proofs of the omnipotence d care of God: one is the creation of man out of a minal drop—an idea to which Mohammed often recurs; e other is the then recently introduced art of writing, hich the Prophet instinctively seizes on as a means of opagating his doctrines. It was only after Mohammed countered obstinate resistance that the tone of the revel tions became thoroughly passionate. In such cases he as not slow to utter terrible threats against those who diculed the preaching of the unity of God, of the resur ction, and of the judgment. His own uncle Abú Lahab d rudely repelled him, and in a brief special sura (cxi.) e and his wife are consigned to hell. The suras of this eriod form almost exclusively the concluding portions of e present text. One is disposed to assume, however, at they were at one time more numerous, and that many f them were lost at an early period.

Since Mohammed's strength lay in his enthusiastic and ery imagination rather than in the wealth of ideas and earness of abstract thought on which exact reasoning epends, it follows that the older suras, in which the ormer qualities have free scope, must be more attractive o us than the later. In the suras of the second period he imaginative glow perceptibly diminishes; there is still re and animation, but the tone becomes gradually more rosaic. As the feverish restlessness subsides, the periods re drawn out, and the revelations as a whole become onger. The truth of the new doctrines is proved by accu mulated instances of God's working in nature and in istory; the objections of opponents, whether advanced n good faith or in jest, are controverted by arguments ut the demonstration is often confused or even weak. The histories of the earlier prophets, which had occasion lly been briefly touched on in the first period, are now elated, sometimes at great length. On the whole, the harm of the style is passing away.

There is one piece of the Koran, belonging to the begin ing of this period, if not to the close of the former, which laims particular notice. This is i., the Lord's Prayer of the Moslems, and beyond dispute the gem of the Koran. The words of this sura, which is known as *al fatiha*[1] ("the opening one") are as follows:

(1) In the name of God, the compassionate compassioner. (2) Praise be [literally "is"] to God, the Lord of the worlds, (3) the compassionate compasser, (4) the Sovereign of the day of judgment. (5) Thee do we worship and of Thee do we beg assistance. (6) Direct us in the right way, (7) in the way of those to whom Thou hast been gracious, on whom there is no wrath, and who go not astray.

The thoughts are so simple as to need no explanation, and yet the prayer is full of meaning. It is true that there is not a single original idea of Mohammed's in it. Several words and turns of expression are borrowed directly from the Jews, in particular the designation of God as the 'Compassioner,' *Rahmán*. This is simply the Jewish *Rahmana*, which was a favourite name for God in the Talmudic period. Mohammed seems for a while to have entertained the thought of adopting *al Rahman* as a proper name of God, in place of *Allah*, which was already used by the heathens.[1] This purpose he ultimately relinquished, but it is just in the suras of the second period that the use of *Rahmán* is specially frequent. It was probably in this first sura also that Mohammed first introduced the formula 'In the name of God, etc.' It is to be regretted that this prayer must lose its effect through too frequent use, for every Moslem who says his five prayers regularly as the most of them do repeat it not less than twenty times a day.

The suras of the third Meccan period, which form a pretty large part of our present book, are not entirely prosaic. Some of the revelations are of considerable extent, and the single verses also are much longer than in the older suras. Only now and then a gleam of poetic power flashes out. A sermonizing tone predominates. The suras are very edifying for one who is already reconciled to their import, but to neutral hearers they do not seem very well fitted to carry conviction to the minds of unbelievers. That impression, however, is not correct, for in reality the demonstration of the once longer Meccan suras appear to have been peculiarly influential for the propagation of Islam. Mohammed's mission was not to Europeans, but to a people who, though quick witted and receptive, were not accustomed to logical thinking, while they had outgrown their ancient religion.

When we reach the Medina period it becomes, as has been indicated, much easier to understand the revelations in their historical relations, since our knowledge of the history of Mohammed in Medina is tolerably complete. In many cases the historical occasion is perfectly clear, in others we can at least recognize the general situation from which they arose, and that approximately as to time. There still remain, however, a remnant, of which we can only say that it belongs to Medina.

The style of this period bears a pretty close resemblance to that of the latest Meccan period. It is for the most part pure prose, enriched by occasional rhetorical embellishment. Yet even here there are many bright and impressive passages, especially in those sections which may be recorded as proclamations to the army of the faithful. In the short, hortatory Medinese suras many different messages. At one time it is a summons to do battle for the faith; another, a word of reflection on recently experienced success or misfortune, or a rebuke for their weak faith, or an exhortation to virtue, and so on. He often addresses himself to the 'doubters,' some of whom vacillate between faith and unbelief, others make a pretence of faith, while others

[1] Since in Arabic also the ... 'to have pity,' ... Arabs must have at once perceived the force of the re...

carcely take the trouble even to do that. They are no onsolidated party, but to Mohammed they are all equally exations, because, as soon as danger has to be encountered, r a contribution is levied, they all alike fall away. There re frequent outbursts, ever increasing in bitterness, against he Jews, who were very numerous in Medina and its eighbourhood when Mohammed arrived. He has much s to say against the Christians, with whom he never ame closely in contact; and as for the idolaters, there was ittle occasion in Medina to have many words with them. A part of the Medina pieces consists of formal laws belong g to the ceremonial, civil, and criminal codes; or directions bout certain temporary complications. The most objec ionable parts of the whole Koran are those which treat of Mohammed's relations with women. The laws and regula ions were generally very concise revelations, but most of hem have been amalgamated with other pieces of similar r dissimilar import, and are now found in very long suras. Such is an imperfect sketch of the composition and the ternal history of the Koran, but it is probably sufficient o show that the book is a very heterogeneous collection. t only those passages had been preserved which had a ermanent value for the theology, the ethics, or the juris rudence of the Moslems, a few fragments would have been mply sufficient. Fortunately for knowledge, respect for he sacredness of the letter has led to the collection of all he revelations that could possibly be collected, the "abro gating" along with the "abrogated," passages referring to assing circumstances as well as those of lasting importance. Every one who takes up the book in the proper religious rame of mind, like most of the Moslems, reads pieces directed against long obsolete absurd customs of Mecca ust as devoutly as the weightiest moral precepts, perhaps ven more devoutly, because he does not understand them o well.

At the head of twenty-nine of the suras stand certain mysterious letters, from which no clear sense can be obtained. Thus, before ch. xxxi. xxxii. we find *Alif Lam Mim*, before ch. xlvi. *Ha Mim*. Noldeke at one time suggested that these initials did not belong to Mohammed's text, but might be the monogrammatic possessors of codices which, through neglect on the part of the editors, were incorporated in the final form of the Koran; now deems it more probable that they are to be traced to the Prophet himself, as Sprenger, both the other suppose. One cannot indeed admit the truth of Loth's statement that in the majority opening words of these suras we may generally find an allusion to the accompanying initials; but it can scarcely be accidental that the first verse of the great majority of them, namely, in the second sura, contains the word "book," "revelation," or some equivalent. They usually begin with "This is the book," or "Revelation down-sending of the book," or something similar. Of suras which commence in this way only a few (xxviii. xl. xli. xxx. xxxiv.) want the initials, while only xxix. and xxx. have the initial and no mediate. These few exceptions may easily have proceeded from an early corruption; at all events they cannot destroy the evidence of the greater number. Mohammed seems to have meant these letters to be a mysterious reference to the archetypal text in heaven. To one who regarded the art of writing, of which at first he had but a very imperfect knowledge, as something supernatural, and who lived among illiterate people, an A B C may well have seemed more significant than to us who have been initiated into the mysteries of this art from our childhood. The Prophet himself can hardly have attached any particular meaning to these symbols, they served their purpose if they conveyed an impression of divinity and enigmatical obscurity. In fact the Koran admits that it contains many things which neither can nor were intended to be understood (iii. 5). To regard these letters as ciphers is a precarious hypothesis, for the simple reason that cryptography is not to be looked for in the very infancy of Arabic writing. If the letters are actually ciphers, the multiplicity of possible explanations at once precludes the hope of a plausible interpretation. None of the efforts in this direction, whether by Moslem scholars or by Europeans, have led to convincing results. This remark applies even to the ingenious conjecture of Sprenger, that the letters كهيعص *Kaf He Ye Ain Sâd* before xix. (which treats of John and Jesus, and, according to tradition, was sent to the Christian king of Abyssinia) stand for *Jesus Nazarenus Rex Judæorum*. Sprenger arrives at this explanation by a very artificial method; and besides, Mohammed was not so simple as the Moslem traditionalists, who imagined that the Abyssinians could read a piece of the Arabic Koran. It need hardly be said that the Moslems have from of old applied themselves with great assiduity to the decipherment of these initials, and have sometimes found the deepest mysteries in them. Generally, however, they are content with the prudent conclusion, that God alone knows the meaning of these letters.

When Mohammed died, the separate pieces of the Koran, notwithstanding their theoretical sacredness, existed only in scattered copies; they were consequently in great danger of being partially or entirely destroyed. Many Moslems knew large portions by heart, but certainly no one knew the whole; and a merely oral propagation would have left the door open to all kinds of deliberate and inadvertent alterations. Mohammed himself had never thought of an authentic collection of his revelations; he was usually concerned only with the object of the moment, and the idea that the revelations would be destroyed unless he made provision for their safe preservation, did not enter his mind. A man destitute of literary culture has some difficulty in anticipating the fate of intellectual products. But not long after the death of the Prophet, most of the Arabs revolted against his successor, and had to be reduced to submission by force. Especially sanguinary was the contest against the prophet Maslama (Mubarrad, *Kâmil* 443, 5), an imitator of Mohammed, commonly known by the derisive diminutive Mosailma. At that time (A.D. 633) many of the most devoted Moslems fell, the very men who knew most Koran pieces by heart. 'Omar then began to fear that the Koran might be entirely forgotten, and he induced the Caliph Abubekr to undertake the collection of all the parts. The Caliph laid the duty on Zaid, the son of Thabit, a native of Medina, then about twenty-two years of age, who had often acted as amanuensis to the Prophet, in whose service he is even said to have learned the Jewish letters. The account of this collection of the Koran has reached us in several substantially identical forms, all of which goes back to Zaid himself. According to it, he collected the revelations from copies written on flat stones, pieces of leather, ribs of palm leaves (not palm leaves themselves, as Weil and such like material, but chiefly "from the breasts of men," *i.e.* from their memory. From these he wrote a certain copy, which he gave to Abúbekr, from whom it came to his successor 'Omar, who again bequeathed it to his daughter Hafsa, one of the widows of the Prophet. This redaction, commonly called *al sohof* ("the leaves"), has from the first no canonical authority; and its internal arrangement can only be conjectured.

The Moslems were as far as ever from possessing a uniform text of the Koran. The bravest of their warriors sometimes knew deplorably little about it; distinction on the field they cheerfully accorded to pious men like Ibn Mas'úd. It was inevitable, however, that discrepancies should emerge between the texts of professed scholars, and as these men in their several localities were authorities on the reading of the Koran, quarrels began to break out between the levies from different districts about the true form of the sacred book. During a campaign in A.H. 30 (A.D. 650-1), Hodhaifa, the victor in the great and decisive battle of Nehawend which was to the empire of the Sásánids what Gaugamela was to that of the Achæmenidæ—perceived that such disputes might become dangerous, and therefore urged on the Caliph 'Othmán the necessity for a universally binding text. The matter was entrusted to Zaid, who had made the former collection, with three leading Koraishites. These brought together as many copies as they could lay their hands on, and prepared an edition which was to be canonical for all Moslems. To prevent any further disputes, they burned all the other codices except that

afsa, which, however, was soon afterwards destroyed by
erwán, the governor of Medina. The destruction of the
rlier codices was an irreparable loss to criticism; but, for
e essentially political object of putting an end to con-
oversies by admitting only one form of the common book
religion and of law, this measure was necessary
The result of these labours is in our hands; as to how
ey were conducted we have no trustworthy information,
adition being here too much under the influence of dog
atic presuppositions. The critical methods of a modern
ientific commission will not be expected of an age when
e highest literary education for an Arab consisted in
bility to read and write. It now seems to me highly
obable that this second redaction took this simple form
aid read off from the codex which he had previously
ritten, and his associates, simultaneously or successively,
rote one copy each to his dictation. It certainly cannot
ve been by chance that, according to sure tradition, they
rote exactly four copies. Be that as it may, it is impos-
ble now to distinguish in the present form of the book
hat belongs to the first redaction from what is due to
e second.

In the arrangement of the separate sections, a chronolo-
on according to contents was impracticable because of the
ariety of subjects often dealt with in one sura. A chrono
gical arrangement was out of the question because the
hronology of the older pieces must have been imperfectly
nown, and because in some cases passages of different
ates had been joined together. Indeed, systematic prin
ples of this kind were altogether disregarded at that
eriod. The pieces were accordingly arranged in rudimen
inate order, the only rule observed being to place the
ng súras first and the shorter toward the end, and even
at was far from strictly adhered to. The short opening
ra is so placed on account of its superiority to the rest,
nd two magical formulæ are kept for a sort of protection
the end; these are the only special traces of design
he combination of pieces of different origin may proceed
artly from the possessors of the codices from which Zaid
ompiled his first complete copy, partly from Zaid himself.
he individual súras are separated simply by the super-
ription—"In the name of God, the compassionate Com
assioner," which is wanting only in the ninth. The
dditional headings found in our texts (the name of the
ra, the number of verses, etc.) were not in the original
odices, and form no integral part of the Koran.

It is said that 'Othmán directed Zaid and his associates,
cases of disagreement, to follow the Koraish dialect;
ut, though well attested, this account can scarcely be
orrect. The extremely primitive writing of those days
as quite incapable of rendering such minute differences
s can have existed between the pronunciation of Mecca
nd that of Medina.

'Othmán's Koran was not complete. Some passages are
vidently fragmentary; and a few detached pieces are still
xtant which were originally parts of the Koran, although
hey have been omitted by Zaid. Among these are some
which there is no reason to suppose Mohammed desired to
uppress. Zaid may easily have overlooked a few stray
ragments, but that he purposely omitted anything which
e believed to belong to the Koran is very unlikely. It
as been conjectured that in deference to his superiors he
ept out of the book the names of Mohammed's enemies,
f they or their families came afterwards to be respected.
But it must be remembered that it was never Mohammed's
ractice to refer explicitly to contemporary persons and
ffairs in the Koran. Only a single friend, his adopted
on Zaid (xxxiii. 37), and a single enemy, his uncle Abú
Lahab (cxi.)—and these for very special reasons—are men
ioned by name; and the name of the latter has been left
in the Koran with a fearful curse annexed to it, although
his son had embraced Islam before the death of Mohammed.
So, on the other hand, there is no single verse or clause
which can be plausibly made out to be an interpolation by
Zaid at the instance of Abubekr, 'Omar, or 'Othman. Slight
clerical errors there may have been, but the Koran of
'Othmán contains none but genuine elements, though
sometimes in very strange order.

Of the four exemplars of 'Othman's Koran, one was kept
in Medina, and one was sent to each of the three metro
politan cities, Cufa, Basra, and Damascus. It can still be
pretty clearly shown in detail that these four codices
deviated from one another in points of orthography, in the
insertion or omission of a *wa* ("and"), and such like
minutiæ. But these variations nowhere affect the sense.
All later manuscripts are derived from these four originals.

At the same time, the other forms of the Koran did
not at once become extinct. In particular we have
some information about the codex of Obay. If this
had which gives the order of the súras correct, it must
have contained substantially the same materials as our text
in that case Obay must have used the original collection
of Zaid. The same is true of the codex of Ibn Ma'súd,
of which we have also a catalogue. It appears that the
principle of putting the longer súras before the shorter was
more consistently carried out by him than by Zaid. He
omits 1, and the magical formulæ of cxiii. cxiv. Obay,
on the other hand, had embodied two additional short
prayers, which we may regard as Mohammed's. One
can easily understand that differences of opinion may have
existed as to whether and how far formularies of this kind
belonged to the Koran. Some of the divergent readings
of both these texts have been preserved, as well as a con
siderable number of other ancient variants. Most of these
are decidedly inferior to the received reading, but some
are quite as good, and a few deserve preference.

The only man who appears to have strongly opposed
the general introduction of 'Othman's text is Ibn Mas'úd.
He was one of the oldest disciples of the Prophet, and had
often rendered him personal service; but he was a man of
contracted views, although he became one of the pillars of Mo
lem theology. His opposition had no effect. Now when
we consider that at that time there were many Moslems
who had heard the Koran from the mouth of the Prophet,
that other measures of the rabeede 'Othman met with
the most vehement resistance on the part of the bigoted
champions of the faith, that there were till further merits
against him by some of his ambition, old comrades until
at last they murdered him, and finally that in the civil
wars after his death the several parties were glad of any
pretext for branding their opponents as infidels; when
we consider all this, we must regard it as a strong testi
mony in favour of 'Othman's Koran that no party, not
even that of 'Ali, found fault with his conduct in this
matter, or repudiated the text framed by Zaid, who was
one of the most devoted adherents of 'Othman and his
family.

But the relation to not the close of the textual history of the
Koran. The ancient Arabic alphabet was very imperfect, at first
only wanted marks for the short and in part even for the long
vowels, but it often expressed several consonants by the same sign.
Hence there were many words which could be read in very different
ways. The variety of possible readings was at first very great, and
many readers seem to have actually made it their object to discover
pronunciations which were new, provided they were at all appro
priate to the ambiguous text. There was also a drift to the license
grammatical forms, which had not as yet been exactly restricted.
An effort was made by many to establish a more refined pronuncia
tion for the Koran than was usual in common life or in secular
literature. The various schools of "readers" differed very widely
from one another; although for the most part there was no im
portant divergence as to the sense of words. A few of them grad

ally rose to special authority, and the rest disappeared. Seven reader[illegible] are generally reckoned chief authorities, but for practical purposes this number was continually reduced in process of time, so that at pre[illegible]ent only two "reading-styles" are in actual use, – the common style of Hafs, and that of Nafi', which prevails in Africa to the west of Egypt. There is, however, a very comprehensive mas[illegible]oretic literature in which a number of other styles are indicated. The invention of vowel-signs, of diacritic points to distinguish consonants formed com[illegible]onants, and of other orthographic signs soon put a stop to arbitrary conjectures on the part of the readers. Many scribes objected to the introduction of these innovations in the sacred text, but theological consistency had to yield to practical necessity. In accurate copies, indeed, all such additions, as well as the title of the sūras etc., are written in coloured ink, while the black character professes to represent exactly the original of Othman. But there is probably no copy quite faithful in this respect.

In European libraries, besides innumerable modern manuscripts of the Koran, there are also codices or fragments, of high antiquity, some of them probably dating from the 1st century of the Flight. For the restoration of the text, however, the works of ancient scholars on its readings and modes of writing are more important than the manuscripts, which however elegantly they may be written and ornamented proceed from more or less unskilful copyists. The original, written by Othman himself, has indeed been exhibited in various parts of the Mohammedan world. The library of the India Office contains one such manuscript, bearing the subscription: "Written by Othman the son of 'Affan." These, of course, are fabulous forgeries, although of very ancient date, as are those which profess to be from the hand of 'Ali, one of which is preserved in the same library. In recent times the Koran has been often printed and lithographed, both in the East and the West.

Shortly after Mohammed's death certain individuals applied themselves to the exposition of the Koran. Much of it was obscure from the beginning to other sections were unintelligible apart from a knowledge of the circumstances of their origin. Unfortunately, those who took possession of this field were not very honourable. Ibn 'Abbas, cousin of Mohammed, and the chief source of the traditional exegesis of the Koran, has, on theological and other grounds, given currency to a number of falsehoods, and at least some of his pupils have emulated his example. These earliest expositions deal more with the sense and connection of whole verses than with the separate words. Afterwards, as the knowledge of the old language declined, and the study of philology arose, more attention began to be paid to the explanation of vocables. A good many fragments of this older theological and philological exegesis have survived from the first two centuries of the Flight, although we have no complete commentary of this period. Most of the exposition must still be found in the very large commentary of the celebrated Tabari (A.D. 839-923), of which an almost complete copy is in the Viceregal library at Cairo. Another very famous commentary is that of Zamakhshari (A.D. 1075-1144), edited by Nassau Lees (Calcutta, 1856), but this scholar, with his great insight and still greater subtlety, is too apt to read his own scholastic ideas into the Koran. The favourite commentary of Baidawi (*ob.* A.D. 1286), edited by Fleischer, Leipsic, 1846-1848, is little more than an abridgment of Zamakhshari's. Thousands of commentaries on the Koran, some of them of prodigious size, have been written by Moslems; and even the number of those still extant in manuscript is by no means small. Although these works all contain much that is useless or false, yet they are invaluable aids to our understanding of the sacred book. An unbiassed European can, no doubt, see many things at a glance more clearly than a good Moslem who is under the influence of religious prejudice; but we should still be helpless without the exegetical literature of the Mohammedans. Nevertheless, a great deal remains to be accomplished by European scholarship for the correct interpretation of the Koran. We want, for example, an exhaustive discussion and discussion of all the Jewish elements in the Koran; a praiseworthy beginning has already been made in Geiger's youthful essay *Was hat Mahomet aus dem Judenthume aufgenommen?* (Bonn, 1833). We want especially a thorough commentary, executed with the methods and resources of modern science. No European language, it would seem, can even boast of a translation which completely satisfies modern requirements. The best are in English: where we have the extremely paraphrastic, but for its time admirable translation of Sale (repeatedly printed), that of Rodwell (1861), which seeks to give the pieces in chronological order, and that of Palmer (1880), who wisely follows the traditional arrangements. The introduction which accompanies Palmer's translation is not in all respects abreast of the most recent scholarship. Considerable extracts from the Koran are well translated in E. W. Lane, *Selections from the Kur-an*.

Besides commentaries on the whole Koran, or on special parts and topics, the Moslems possess a whole literature bearing on the sacred book. There are works on the spelling and right pronunciation of the Koran, works on the beauty of its language, on the number of its verses, words, and letters, etc.; nay, there are even works which would nowadays be called "historical and critical introduction." Moreover, the origin of Arabic philology is intimately connected with the recitation and exegesis of the Koran. To exhibit the importance of the sacred book for the whole mental life of the Moslems would be simply to write the history of that life itself, for there is no department in which its all pervading but unfortunately not always salutary influence has not been felt.

The unbounded reverence of the Moslems for the Koran reaches its climax in the doctrine that this book, as the divine word, *i.e.* as thought as remanent in God, and consequently *eternal* and *uncreated*. That doctrine has been accepted by almost all Mohammedans since the beginning of the 3d century. Some theologians did indeed protest against it with great energy; it was in fact too preposterous to declare that a book composed of unstable words and letters, and full of variants, was absolutely divine. But what were the distinctions and sophisms of the theologians for, if they could not remove such contradictions, and convict their opponents of heresy!

The following works may be specially consulted: Weil, *Einleitung in den Koran*, 2d ed., 1878; Th. Nöldeke, *Geschichte des Qorân's* (Göttingen, 1860), and the Lives of Mohammed by Muir and Sprenger. (TH. N.)

Note. Arabic has only three short vowels, *a*, *i*, *u*, which are pronounced between the short sounds of *a* and *e*, *e* and *i*, *o* and *u* respectively. In the transcription adopted these are represented by *a* or *e*, *i* or *e*, and *o* or *u* respectively. The corresponding long vowels are *ā*, *ī*, *ū*. The letter *w* (*wāw*) has the sound of English *w*, and *y* (*yā*) that of English *y*. The diphthongs *aw* and *ay* are pronounced by English scholars as in *now* and *day*. In the transcription of consonantal *th* is as the *th* in *thin*, *dh* the *th* in *the*, *dh* and *z* are pronounced as in English, *s* is always sharp as in *sin*, *sh* is equivalent to English *sh*, *kh* (often written *ch*) nearly the Scottish or German *ch*, *h* is a deep breathing, seldom pronounced by Europeans; *gh* a guttural something like the modern Greek γ or the Northumberland burr. In a few names the conventional spelling is used. In proper names *b.* stands for *ibn*, "son of."

H, Jules (1800-1876), Orientalist, was born at
rt 25th October 180 , and educated for the Lutheran
at Tübingen; bu his inclinations carried him from
y through Hebre to Oriental studies, and in 1823
ook himself to Paris, at that time under De Sacy
nt European school of Eastern letters. He soon ac
reputation, and from 1826 to 1833 was nominally
or at Tübingen, with permission to continue his
in France, but he never entered on the duties of
lice, Paris having become his second home. In
e was charged by the French Government with the
tion of an edition of the *Shah Nameh*, the first
of which appeared in 1838, while the seventh and
s left unfinished at his death, in 1844. He was
ted to the Institut, and in 1847 he became pro
f Persian at the College de France. But his know
nd interest extended to all departments of Oriental
, and this catholicity of taste, united to a singular
ality of judgment and breadth of view, gave him a
emarkable personal influence on the course of East
rning in France. The chief sphere of the influence
Société Asiatique, which he served for many years
tary-adjunct, as secretary, and finally as president
nual reports on Oriental science presented to the
from 1840 to 1867, and collected after his death (4th
y 1876, at Paris) under the title *Vingt-sept Ans des
Orientales* (Paris, 1879), are an admirable history
progress of Eastern learning during the years, and
the high esteem in which he was held by scholars.

HLER, Johann Adam (1796-1838), Roman Catholic
ian, was born at the village of Igersheim in Wür
g on 6th May 1796, and, after studying philosophy
eology in the Lyceum at Ellwangen, entered the
nstift in the university of Tübingen in 1817.
d to the priesthood in 1819, he was appointed to
at Riedlingen, but speedily returned as "repetent"
ngen, where he became privat docent in 1822, ex
nary professor of theology in 1826, and ordinary in
The controversies excited by his *Symbolik* (1832)
so unpleasant that in 1835 he accepted a call to
versity of Munich. In 1838 he was appointed to
anery of Würzburg, but died shortly afterwards
pril 1838).

r wrote *Die Einheit in der Kirche* (Tübingen, 1825),
*ius der Grosse u. d. Kirche seiner Zeit im Kampfe mit d.
nus* (2 vols., Mainz, 1827); *Symbolik, oder Darstellung der
schen Gegensätze der Katholiken u. Protestanten nach ihren
en Bekenntnisschriften* (Mainz, 1832, 8th ed., 1874-75,
nsl. by J. B. Robertson, 1843), and *Neue Untersuchungen
egensätze zwischen den Katholiken u. Protestanten* (1834).
ammelte Schriften u. Aufsätze were edited by Döllinger in
is *Patrologie* by Reithmayr, also in 1839, and a *Biographie*
ner was published at Ratisbon in 1866. It is with the
e that his name is chiefly associated, the interest excited
Protestant circles is shown by the fact that within two
its appearance it had elicited three replies of considerable
ne, those namely of Baur, Marheineke, and Nitzsch. But
characterized by abundant learning and acuteness, as well
siderable breadth of spiritual sympathy, and thus a stimula
suggestive work, it cannot be said to have been accepted
olics themselves as embodying an accurate objective view
ctual doctrine of their church. The liberal school of
of which Möhler was a prominent exponent was dis-
in official circles, while Protestants, on the other hand
n that the author has failed to grasp the vast significance
Reformation as a great movement in the spiritual history
nd, while expending needless pains on an exposition of
rinal shortcomings, inconsistencies, and contradictions of
viduals who were its leaders.

IR, Karl Friedrich (1806-1879), a philosopher
greatest claims to scientific distinction are as yet,
indubitable, only partially admitted, was the son
ell-to-do druggist in Coblentz, and was born 4th
ber 1806. Being a delicate child, he received much
arly education at home, in great part in his father's
laboratory. To this may be traced much of the sk
showed in devising instruments and methods of ap
which are still in common use in chemical and pharm
tical laboratories. At the age of 21 he studied chem
under Gmelin, and, after five years spent in Heide
Berlin, and Bonn, returned with the degree of Ph.D. t
his father's establishment. On the death of his fath
1840 he succeeded to the business, retiring from it for
the bar in 1857. Serious pecuniary losses led h
the age of 57 to become a privat docent in Bonn, whe
was soon after appointed, by the direct influence o
Emperor, extraordinary professor of pharmacy. In
vate and domestic life he was a man of singularly wi
manners, intensely fond of music and poetry, to the
of which he showed wonderful memory. But his m
prominent spirit perhaps we might even in some
say his wrongheadedness in matters of scientific and
logical authority had raised such a host of enemies
even royal influence could not secure his further adv
ment. Although he stood at the very head of the
the pharmacists of Germany, his name was deliber
omitted from the list of the commission entrusted
the preparation of the *Pharmacopoea Germanica*,
in that work many of his ideas and processes were
porated by the very men who had previously denou
them. He died in October 1879.

Mohr's best known work is his *Lehrbuch der chemisch-analy
Titrirmethode* (1855) which has already run through many ed
and which was specially commended by Liebig. His improve
in methods of chemical analysis or apparatus fill scores of
extending over some fifty years. He also published a numb
physical papers on subjects such as Hail, St Elmo's Fire, Geom
&c., and a curious notice of the critical position of Ozone
shows that Homer, on four different occasions, mentions th
pharous smell produced by lightning, and employs the very
from which the name of Ozone was long afterwards coined
1866 appeared his *Geschichte der Erde, ein Versuch auf
Grundlage*, which has obtained a wide circulation.

But he will be remembered in future time mainly on acc
a paper *Ueber die Vorstellung der Kraft* published in 1837
unfortunately has not yet appeared in full in English trans
The history of this paper is remarkable. It was rejected ad
into *Poggendorff's Annalen* and was then sent to Baumgart
Vienna, in whose *Zeitschrift für Physik &c.* it was at once publ
As no proof-sheets reached Mohr, he concluded that his pap
been lost or rejected and contented himself with publishing
analysis in the *Annalen der Pharmacie* of which he was an
This analysis is only true to a very inadequate idea of the scope and
of the paper. In 1861 Dr Ahrens unearthed the paper fro
forgotten pages of the *Zeitschrift* and the author was glad
reprint it with notes, while the recent discussions as to the h
of Conservation of Energy were still being carried on. Alon
it he issued a number of other papers of scientific interest mainly

Unless some still further author should be discovered, the
be no doubt that Mohr is to be recognized as the first to enu
in its generality what we now call the conservation of energy.
the title of his paper must be stated in his own words, "Ein
the 54 known chemical elements there is but one physical
one agent only, called Kraft (energy)." It may a
according to circumstances as motion, chemical affinity, coh
electricity, light, and magnetism, and from any one of
forms it can be transformed into any of the others." Even
after nearly half a century of rapid advance it would be
be difficult to improve this statement except by omitting, as
transformation of energy is one such guarding expression
whose origin in part.' But if Mohr has asserted the principle
has claim to be the 'discoverer of energy' (as Meikle's epitaph
appears to have been the discovery (by Forbes) of the polari
of radiant heat. He goes through the whole of the theore
physics, pointing out the explanation of each experimental re
a transformation of energy mentioning even the electric cu
produced by electro-magnetic induction as a transformation
energy required to draw the coil from the magnet, one of the
method used by Joule for quantitative determination. H
merical results, based on data quoted from various books, ar

[1] It is to be remembered that even the most eminent author
Germany—as for instance, Von Helmholtz in his *Erhaltung der Kraft* of 1847
till quite recently the word Kraft in the sense of Energy.

very inaccurate; the correct experimental determinations we Joule. But it must be remembered that these speculations, as they were and accurate on the whole) as they have been to be required the confirmation which they received from the mental work of Colding and Joule, or from the *Essay* of Von holtz, whose basis also is wholly experimental, being the fact "perpetual motion" is recognized as unattainable.

OIR, David Macbeth (1798-1851), the "Delta" of *Magazine*, one of its most popular contributors early days, was born at Musselburgh 5th January and was a physician in active practice there from his od to his death (6th July 1851). He seems to have a man of winning manners and noble integrity of ter, and the intrinsic value of his poetry has been in quence somewhat over-estimated by critics of repute njoyed his personal acquaintance. He had no indis nt vein as a writer of serious verse, and his technical e as a poet do not bear examination. But his verses undoubtedly popular with the readers of the magazine time. A collection of them was edited by Thomas n 1852. As a kindly humourist "Delta" had a more l turn. His *Autobiography of Mansie Wauch*, pub separately in 1828, is a Scotch classic. And some satirical squibs on passing events were written with the life and spirit. His *Outlines of the Ancient y of Holland* (1831) evidence his industry and ver of talent. His *Sketch of the poetical literature of st Half Century* (1851) is more remarkable for the of it rhetorical ornaments than for depth or fresh l insight.

OIR, George (1800-1870), author of the treatises on ry" and "Romance" in the seventh edition of the *Encyclopædia Britannica*, and born at Aberdeen in 1800, n Edinburgh lawyer of very varied accomplishments. as appointed professor of rhetoric in 1835, professor ts law in 1861; he had a considerable success at the sh Bar, was successively sheriff of Ross and sheriff ling, and was a frequent contributor to *Blackwood's ine*. Moir honourably maintained the literary tradi of Edinburgh law. He was a man of very wide g, catholic sympathy, and fastidious taste, alive to arious degrees and kinds of excellence in literature, critical and hard to please to do justice to his own of ideas. He died in 1870.

OISSAC, chief town of an arrondissement in the ment of Tarn-et-Garonne, France, is situated on the ank of the Tarn, and on the railway line from Bor to Cette, 17 miles west-north-west of Montauban. The of St Peter, belonging to the 15th century, has a y of the 12th century, remarkable for its elaborate eautiful sculpture, representing Scriptural scenes. cted with the choir of the church is a cloister dating the beginning of the 12th century, and one of the specimens of this kind of building in France, the d arches are supported by small columns with ured capitals. The town has a large trade in corn our, and the mills afford employment to a considerable r of persons. The population in 1881 was 9202.

town owes its origin to an abbey founded between 630 40 by St Amand, the friend of Dagobert. After being ted to the saracens, the abbey was restored by Louis of me, son of Charlemagne. Subsequently it was made de- nt on Clairac; but in 1618 it was secularized by Pope Paul d replaced by a house of Augustinian monks, which was ssed at the Revolution. The town, which was erected into mune in the 12th century, was taken by Richard Cœur de and by Simon de Montfort.

OKADDASI. Shams al-Dín Abú Abdallah Moham- on Ahmad al-Mokaddasi, *i.e.*, of Jerusalem, also called hshari, was the author of a famous description of the of Islam, which much surpasses the earlier works of me kind. His paternal grandfather was an architect mence, who constructed many public works in Pales- tine, and his mother's family was opulent. He was hi a well-educated and talented man, with an exorbitant of his own qualities, and some curious affectations, suc that of imitating for each region the dialect of its inh ants. His descriptions rest on very extensive tra continued through a long series of years. His first pilg age was made at the age of twenty, but his book was published till A.H. 375 (985-6 A.D.), when he was years old. The two MSS. (at Berlin and Constantino represent a later recension (A.H. 378). The book bec known in Europe through the copy brought from I by Sprenger, and was edited by De Goeje in 1877 as third part of his *Biblioth. Geographorum Arabicorum*.

MOKANNA (*Al Mokanna'*, "the veiled") was explained above, p. 580, the surname given to Hakim 'Ata, a man of unknown parentage, originally a fulle Merv, who posed as an incarnation of Deity, and hea a revolt in Khorasan against the caliph Mahdí. Mu related of his magical arts, especially of a moonlike visible for an enormous distance which he made to rise a pit near Nakhshab. He died by poison in A.H. (779-80 A.D.).

MOKSHAN, a town of Russia, situated in the gov ment of Penza, 27 miles to the north-west of the capit the province, and 18 miles from the Ranzay railway sta It has 14,500 inhabitants, who are engaged in agricul or work in flour mills, oil works, tanneries, and pot works. A few merchants export corn and flour. Moks which was built in 1535 as a fort to protect the cou from the raids of the Tatars and Kalmuks, is suppo to occupy the site of the town of Mescheryaks, Murun mentioned as early as the 9th century. It has be rapidly to increase since the railway between Moscow Penza was made.

MOLA, or Mola di Bari, a seaport town of Italy, in province of Bari, 13 miles from Bari on the railwa Brindisi. It is an old-fashioned place with irregular str but outside of the walls several new districts have gr up. The foreign, and to some extent also the coas trade has considerably declined since 1863, and the munal population has decreased from 12,574 in 186 12,135 in 1881. Little is known about the early his of Mola; it was sold by Alphonso I. to Laudolfo Maram in 1436, and ten years afterwards to Niccolo Tovaldo.

MOLASSES. See Sugar.

MOLAY, Jacques de, a native of Burgundy, bec grand-master of the order of the Temple in 1298, was the last who held that dignity. He was burned at stake in 1314. See Templars.

MOLDAVIA. See Roumania.

MOLE (contracted form of mould-warp, *i.e.*, mo caster), a term restricted in England to the common (*Talpa europæa*), a small, soft-furred, burrowing mam with minute eyes, and broad fossorial fore feet, belon to the order *Insectivora* and family *Talpidæ*, but gene applied elsewhere to any underground burrowing an of the class Mammalia. Thus, in North America we representing the same family, the star-nosed moles (*dalura*), and the shrew moles (*Scalops* and *Scapanus*) South Africa, the golden moles of the far-removed fa *Chrysochlorida*; and in South-East Europe, Asia, South Africa, the rhizophagous rodent moles of the *Rodentia* and families *Spalacidæ* and *Muridæ* (see M MALIA, vol. xv. pp. 405, 419, figs. 64 and 96).

Talpa europæa, the Common Mole, type of the g *Talpa*,[1] is about six inches in length, of which the measures somewhat more than an inch; the body is

[1] Eight species may be recognized, and arranged, according to dentition, as follows:—

lindrical, and, owing to the very anterior position of relimbs, the head appears to rest between the ers; the muzzle is long and obtusely pointed, terd by the nostrils, which are close together in front; nute eye is almost hidden by the fur, the ear is t a conch, opening on a level with the surrounding ment; the forelimbs are rather short and very muscermmating in broad, naked, shovel-shaped feet, the normally directed outwards, each with five subequal rmed with strong flattened claws, the hind feet, on trary, are long and narrow, and the toes are provided ender claws. The body is densely covered with rect, velvety fur, the hairs uniform in length and ss, except on the muzzle and short tail, the former some straight vibrissae on its sides, while the s clothed with longer and coarser hairs. The fur is ly black, with a more or less greyish tinge, or sh black, but various paler shades up to pure have been observed.

food of the mole consists chiefly of the common orm, in pursuit of which it forms its well-known ound excavations. Its habits, so difficult to observe, any years ago most patiently studied and described Henri le Court. Like many other mammals the as a lair or fortress to which it may retire for . This is constructed with much ingenuity. It s of a central nest formed under a hillock which is in some protected situation, as under a bank, or the roots of trees. The nest, which is lined with rass or leaves, communicates with the main run by ssages, one of which only joins it directly, leading ards for a short distance and then ascending again. er three are directed upwards and communicate at intervals with a circular gallery constructed in the part of the hillock, which in turn communicates by sages leading downwards and outwards with another urger gallery placed lower down on a level with the nest, from which passages proceed outwards in t directions, one only communicating directly with in run, while the others, curving round, soon join, in culs-de sac. The main run is somewhat wider e animal's body, its walls are smooth, and formed ly compressed earth, its depth varying according nature of the soil, but ordinarily from four to six Along this tunnel the animal passes backwards and ds several times daily, and here traps are laid by tchers for its capture. From the main run numerous es are formed on each side, along which the animal ts prey, throwing out the soil in the form of mole The mole is the most voracious of mammals, and, ived of food, is said to succumb in from ten to hours. Almost any kind of flesh is eagerly devoured ive moles, which have been seen by various observers, naddened by hunger, to attack animals nearly as s themselves, such as birds, lizards, frogs, and even ; toads, however, they will not touch, and no form etable food attracts their notice. If two moles be d together without food, the weaker is invariably ed by the stronger. They take readily to the water respect, as well as in external form, re-emuling their

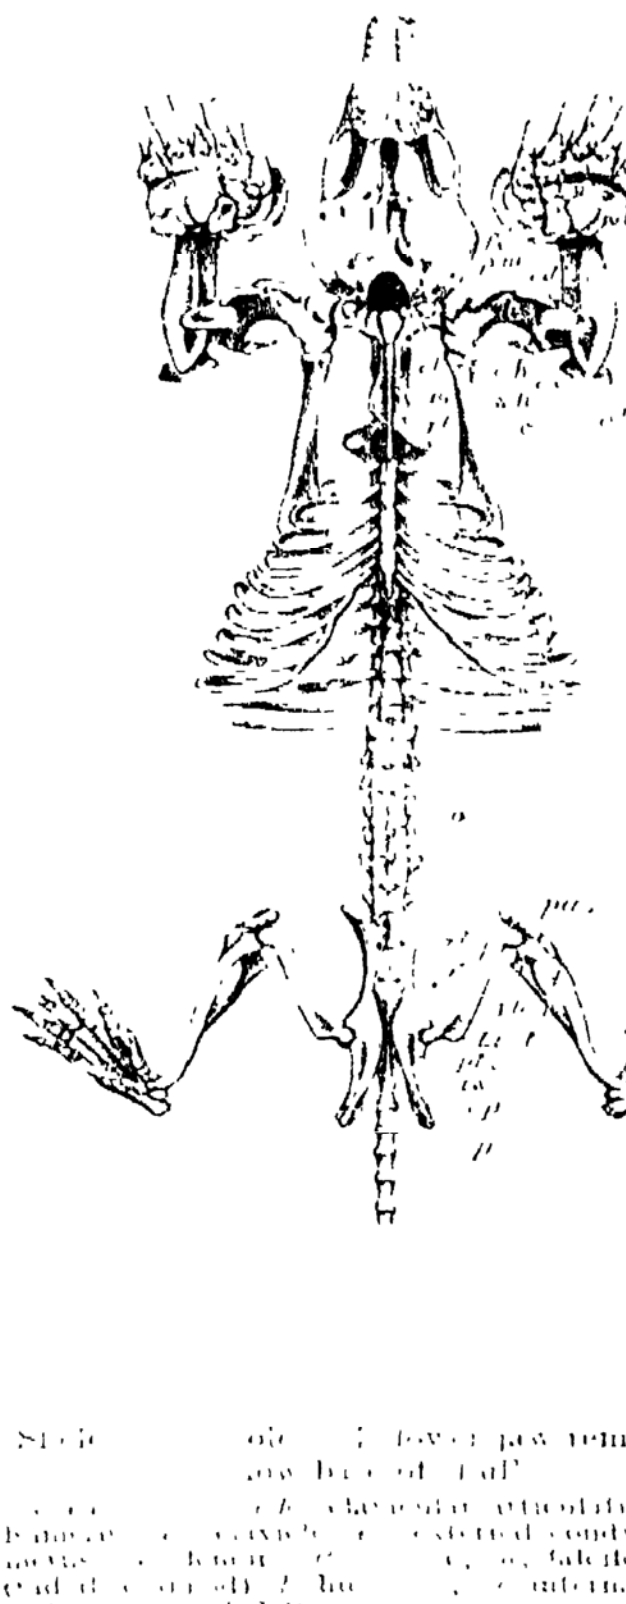
t in *T. europæa*, the eyes are covered by a membrane. In *ura* the short tail is concealed by the fur. *T. europæa* ex- om England to Japan. *T. caca* is found south of the Alps, the g species are all Asiatic, and of them two only *T. micrura* —occur south of the Himalayas. (See Dobson, *Mono the Insectivora*, Part ii., 1883.)

representatives on the North American continent. writing in 1793, remarks that he saw a mole p towards a small island in the Loch of Clunie, 18 from land, on which he noticed molehills.

The sexes come together about the second w March, and the young generally from four to number which are brought forth in about six quickly attain their full size.

The mole exhibits in its whole organization the most adaptation to its peculiar mode of life. In the structu



skeleton very strikin departure from the typical mammalian form are noticeable. The first dorsal bone is so much produced anteriorly as to extend forward as far as a vertical line let down from the second cervical vertebra carrying with it the very short almost quadrate cla

culated with it inferior extremity and distally with the humerus being also connected ligamentously with the scapula. The forelimbs are thus brought opposite the ends of the neck and from this position a three-fold advantage is derived. In the first place, as this is the narrowest part of the body, they add but little to the general width, which if increased, would lessen the power of movement in a confined space; secondly, this position allows of a longer forelimb than would otherwise be possible, and so increases its lever power; and thirdly, although the entire limb is relatively very short, its anterior portion enables the animal when

burrowing, to thrust the claws so far forward as to be in a line with the end of the muzzle, the importance of which is evident. Posteriorly, we find the hind limbs similarly removed out of the way by approximation of the hip joint to the centre line of the body. This is effected by inward curvature of the innominate bones at the ischia to such an extent that they almost meet in the centre, while the pubic bones are widely separated behind. The shortne

It is very interesting to observe how, in the golden (*Chrysochloris*) of South Africa, the necessary modifications in the more posterior parts of the body and limbs fit them for action and meet ground pressure have been brought about in a totally different manner. In them the manubrium sterni is anteriorly elongated, neither are the clavicles shortened in order to be made up for by a deep hollowing out of the anterior end of the thorax, the ribs in these parts and the sternum being convex. The long clavicles have their distal extremities pushed forward and convexities on the side and internal surface of the thorax for the thick muscular arms.

In Jacobs's *Tabulæ Europæ Anatomicæ* (Jena, 1816) the pa pelvic wall marked *pl* in the figure was identified with the s

is due to the humerus, which, like the clavicle, is so duced in length as to present the appearance of a X-shaped bone, with prominent ridges and deep depres- the attachments and origins of the powerful muscles d with it. Its proximal extremity presents two rounded ne: the smaller, the true head of the bone, articulates as h the scapula; the larger, which is really the external rounded off, forms a separate synovial joint with the end vich. This double articulation gives to a naturally loose rigidity necessary to support the great lateral pressure by the forelimb in excavation. The forearm bones are ut those of the forefoot are much flattened and laterally . The great width of the forefoot is also partly due to nce of a peculiar tabiform bone, lying on the inner side of and articulating by its proximal extremity with the wrist radial side and under surface of this bone is inserted a rived from that of the palmaris longus muscle, which, on it as in deluctor, operates it from the side of the l so increases the width of the latter, at the same time the palmar integument to e

ch acting on these remarkably modified limbs are ill n with those of the ordinary mammalian forelimb, differing only relative development. The tendon of the biceps flexor cu sors tunnels, formed by the great expansion of the internal epital crest for the insertion of the large pectoralis major the internal division of the latter muscle is connected sternum, extending across a muscular band between the nd co-ordinating the motions of the forelimbs. The true d latissimus dorsi muscles are of enormous size, probably larger than in any other mammal, and are inserted to to the prominent ridge below the pectoral attachment, the principal agent in the excavating action of the limb eal muscles connecting the slender scapula and through forelimb with the centre line of the neck and with the are large, and the ligamentum nuchæ between them is as in all true moles); the latter condition appears to be due to the prolongation forwards of the sternum (described above), preventing all flexion of the head downwards; and, accordingly, the normal office of the ligament being lost, it ossifies, and so affords a more fixed point for the origins of the superficial cervical muscles.

The skull is long, with slender zygomatic arches; the nasal bones are strong and early become united, and in front of them the nostrils are continued forwards in tubes formed of thick cartilage, the septum between which becomes partially or wholly ossified beneath. There are 7 cervical, 13 dorsal, 6 lumbar, 6 sacral, and 10-12 caudal vertebræ; of the dorsal and lumbar there may be one vertebra more or less. The sacral vertebræ are united by their greatly expanded and laterally compressed spinous processes, and all the others, with the exception of the cervical, are very closely and solidly articulated together, so as to support the powerful propulsive and torsional actions of the limbs. Dentition: i. $\frac{3}{3}$, c. $\frac{1}{1}$, prm. $\frac{4}{4}$, m. $\frac{3}{3}$, = 44 teeth. The upper incisors are simple chisel-edged teeth; the canines are long and two-rooted, then follow three subequal conical premolars and a fourth, much larger, and like a canine; the canines are preceded by three molars with W-shaped cusps. In the lower jaw the three incisors on each side are slightly smaller, and stand more forwards, close behind them is a tooth which, though quite like them, must, from its position in front of the upper canines when the jaws are closed, be considered as the canine; behind it, but separated by an interval, is a large double-rooted conical tooth, the first premolar; the three following premolars are like the corresponding teeth above, but smaller, and are succeeded, as above, by three molars.

The *geographical distribution* of the common mole may be said to exceed that of all the other known species of the genus to which it belongs taken together. It extends from England to Japan, and from the Dovre-Fjeld Mountains in Scandinavia and the Middle Denmark countries in Russia to southern Europe and the southern slopes of the Himalaya, where it occurs at an elevation of 10,000 feet. In Great Britain it is found as far north as Caithness, but in Ireland and in the Western Isles of Scotland (except Mull) it is altogether unknown. (G. E. D.)

MOLECULE

conception of the atomic as opposed to the con nous and infinitely divisible constitution of matter, posed that portions of matter called *atoms* exist, re separated, or are capable of being separated, from er by empty space. (See ATOM.) It may be that t each atom has unchangeable shape and volume as unchangeable mass, but such a conception of is not essential to the hypothesis. It is not even y, as explained in the article ATOM (vol. iii., pp. to maintain that no part of space can be in two the same time. But one attribute of the atom hich its permanence, or, so to speak, its personal depends, is its constituent mass, and this remains , unchanged and unchangeable, through all time vich, indeed, goes so far as to regard the atom as centre of force, the result of whose existence is that atoms or centres can approach each other within a distance, while other physicists regard the atom as a distinct portion of space occupied by that the exclusion of every other, and consisting t matter ideally infinitely divisible, but the parti- h in fact never have been, and never can be, d from each other. In this latter mode of viewing ject, all the conclusions of mechanics which are the conception of the continuity and infinite divi of matter may be applied to the equilibrium or of each individual atom; the atomic theory merely ving the additional hypothesis that, in fact, the separ entities called atoms do exist, and that out of them stances which affect our senses are constructed ory of universal gravitation requires us to believe xistence of forces or actions between every portion of matter and every other portion, determinate in magnitude and direction, and such that, when on the infinitely divisible hypothesis the volumes of these portions are indefinitely diminished, these mutual forces are inversely proportional to the square of the distance between the portions (the distance between any two points, one in the volume of each portion, being in this case taken as the distance between the portions), and directly proportional to the products of the masses, or quantities of the two portions of matter, such forces being regarded provisionally as ultimate facts, while inviting further analysis and explanation. Chemical and chemico-physical investigations indicate the existence of other actions between portions of matter, following other and for the most part unknown laws, and rapidly becoming inappreciable as the distance between the reacting portions is increased. All these hypotheses are to be retained on the hypothesis of discrete atoms as above enunciated, the mutual actions between atoms being the resultant of the actions between the various portions of their constituent matter. The volumes of the atoms are so small that, for any sensible distances apart, the line of the resultant mutual action between them may be taken as coincident with the line joining any point in the volume of one to any point in the volume of the other, but, for distances or parts comparable with the linear dimensions of the atoms, the size and shape of their bounding surfaces must be taken into consideration, and perhaps also the law of distribution of their constituent matter within that surface. In all respects, unless we accept the Boscovichian hypothesis, we simply regard the atom as made up, so to speak, of infinitely divisible matter, while substances, as we know them, are built up of indestructible and unchangeable atoms.

With this conception of an atom, as thus explained, we might be content to rest, confessing our total ignorance of the mode in which such atoms are built up into actual substances, being satisfied to regard such substances as

whereas the true radius bore is widely separated (as shown at this mistake he has been followed by most comparative anatomd hence the mole is generally believed to present the unique y that the outlets of the urinary, generative, and digestive not pass through the arch of the pelvis.

nposed of these distinc portions of matter separated, or able of being separated, by empty space from other tions. But the *molecular* hypothesis of the constitution different kinds of substances aims at analysing this cess by which such substances are built up out of their stituent atoms. The *molecule* of any substance is, by ne chemists, defined as being the smallest portion of that stance to which can be attributed all the chemical pro ties of the substance; by others, as the smallest portion ch, so long as the substance is chemically unchanged, ps together without complete separation of its part he language of Clausius's theorem, if the parts of the ecule have internal motion, the kinetic energy of such rnal motion is equal to the virial of the mutual attrac forces of the parts. Thus the formation of the mole of each particular substance is viewed as an essential in the process of building up that substance out of constituent atoms. The molecule is first built up out atoms arranged in its formation according to a definite e, and then the substance itself is constituted of the ecules. Of course molecules may be, and in fact in y particular substances are, supposed to be more nic; that is to say, the intermediate steps of building he molecule out of the atoms have, in these particular stances, been omitted, the atoms and molecules be com hen identical. The particular arrangement of the ed molecules in the building up of the substance de ines the physical state of that substance—that is, fluid, solid, gaseous, crystalline, or amorphous state, the chemical properties of the substance depend upon constitution of the molecule. As the investigations theories of chemistry appear to indicate not merely existence of permanent atoms, so do they also lead ost as necessarily to the conception of the molecule an entity which bears the same relation to special stances that the atoms bear to matter generally. So as the molecule endures, the substance of which it he molecule retains its chemical properties, with the olution of the molecule, the substance, as that special stance, perishes; the atoms alone continue, and are free nter into other combinations. The permanence of the ecule is relative, that of the atom absolute. The con- ion of the molecular constitution of substances sug s physical questions of great interest, such as the shape, ume, and mass of the constituent molecules, and the tive motions of which their parts are susceptible; and answers to these questions cannot fail to be of great e in chemical and chemico-physical investigations, as as in the theories of light and electricity.

Now, whatever differences may exist between the proper of different substances in the solid and liquid states, re are certain properties which, in the gaseous state, ifest themselves with no variation whatever in all gases alike. Hence the explanation of these common perties—or gaseous laws, as they are called—has ssed a peculiar fascination for physicists. The ten y to expand or fill all accessible space, manifested by gases, proves that on the molecular hypothesis their pound atoms or molecules must be continually tending y apart. We must conceive gases as constituted of mole s, not only separable but actually separated by space l of the matter of which these gases consist; and it may most reasonably expected, therefore, that any general s to which substances in this state conform may afford valuable insight into the constitution of these separate ecules.

Now the general laws to which all gases conform are— *Boyle's law*—that, in a given mass of any gas kept at stant temperature, the pressure per unit of area upon containing surface increases in the same proportion as the volume occupied by the gas is diminished, or at with very slight deviation from exact proportionality *Charles's law*—that, if the temperature be varied whil pressure upon the gas remains the same, the gas incr by $\frac{1}{273}$d of its volume at zero centigrade for every d of centigrade added to the temperature, or, which in bination with Boyle's law is the same thing, that i density be constant, the pressure is directly proportion the temperature measured from the point −273 centig this point being called the zero of absolute tempera (3) *Avogadro's law*—which asserts that all gases a same temperature and pressure contain the same numb molecules in the same volume, and (4) *Dalton's law*— in a mixture of different gases, when there is equilibr each gas behaves as a vacuum to all the rest.

It was at one time considered that these phenom might be explained on the hypothesis of mutual repu forces between the parts of which the gas is compo whether they were regarded as constituted of molecul of infinitely divisible continuous matter,[1] but it has shown in the article ATOM (vol. iii. p. 39 sq.) that t are at least two absolutely conclusive reasons why thi planation cannot be accepted. These objections, toge with the experimental fact proved by Joule that gases, any rate atmospheric air, expand into vacuum without any appreciable change of temperature, must be consi fatal to any mutual force theory of gaseous action, accordingly, physicists have been driven to seek for e method of explaining these laws. The explanation w has been more developed than any other is that know the kinetic theory of gases, which regards the inte energy of a gaseous mass as residing, not in the poten energy of intermolecular forces, but mainly in the ki energy of the molecules themselves, which are assum to be in a state of continual relative velocity, admitting the same time a possible small intermolecular poten energy, and it may be also an interatomic energy, bet the atoms of the individual molecules. That some persistent relative motion does exist in every gaseous is evident from the rapidity with which odours pene the still air where no breath of wind—that is, of abs motion of translation of the mass as a whole or any po of finite size—is perceptible. It becomes an interes question whether the laws of mechanics admit of a thus constituted ever settling at a state of permane that is to say, whether consistently with the hypothes infinite irregularities in the directions and magnitud velocities of individual molecules, there may be found properties of the mass in the aggregate which re

[1] An argument in favour of the corpuscular constitution of ga which attention was recently directed by Professor Osborne Rey (Memoir "On the Dilatancy and Properties of Matter in the G State," *Phil. Trans.*, 1886) is derived from certain phen [illegible] that in the transportation of [illegible] according to this argument, we ha [illegible] such that every portion [illegible] these properties must exist [illegible] contained in any space all [illegible] could be increased or diminished by a va [illegible] argument. Further, certain properties of a gas depe [illegible] of the vessel is worked, and on the qu [illegible] we have proof that gases not contr [illegible] other words, possess dimensional structure. Such pro [illegible] defined in highly-exhausted gases, e.g. for instance in the p [illegible] of Crookes' radiometer. The motion of the vanes whe [illegible] by incident rays appears to depend on the di [illegible] between the vane and the containing wall of the vessel bearing not very high ratio to the distance between the parts [illegible] or mol [illegible] of the gas. At least no satisfactory explanation [illegible] the pheno [illegible] consistent with the gas being continuous has yet [illegible] suggested.

Again, Professor O. Reynolds, from his experiments on the [illegible] piration of gases through porous plate, finds a relation betwe [illegible] gas and the coarseness or fineness of the plate, which would no [illegible] were the gas continuous.

ant, and in agreement with the accepted laws common gases. Now the physical theory of heat compels us gard the intrinsic energy of any gaseous mass as de nt entirely or almost entirely upon the temperature. erefore, this intrinsic energy is to be sought for in inetic energy of the moving molecules, it follows he average value of the kinetic energy of the mole- taken throughout the mass must be also a function temperature.

will proceed to investigate the condition of per e of a number of molecules moving about irregu n any bounded space; and, for simplicity's sake, we fir t of all restrict ourselves to the case of monatomic ules.

know nothing of the size or shape of these atoms, that the volume of each one must be incomparably r than that of the containing region. In shape we as the simplest hypothesis, regard them as spherical, all suppose that there are no intermolecular forces en any two such atoms, except of such a nature as practically insensible when the atoms are not geo ally in contact, and similarly as regards the forces en the atoms and the material bounding surface, orces being of the nature called "conservative." So point of fact we are investigating the mechanical ies of an infinitely large number of infinitely small erfectly elastic spheres moving about in a given and subject to frequent collisions.

[illegible] *let us suppose these spheres equal in [illegible] and that a great number of them are [illegible] moving about with various [illegible] and in various relative directions in [illegible] that the average [illegible] of the kinetic energy of [illegible] that such [illegible]*

N be the total num[illegible] spheres, and let

[illegible]

number of spheres who[illegible]ment velocities parallel s, are intermediate bet[illegible]
$u + du$ respectively
be the resultant velo[illegible] of any of these last-mentioned , and if θ be the inclinat[illegible] to the axis of z, and ϕ that plane ϵ to the plane ϵ the last-mentioned expression will , by changes of the independent variables from ϵ, u, v to nd ϵ,

$$\chi(u, v, w)\epsilon^2 \sin\theta \, d\epsilon \, d\theta \, d\phi.$$

spherical surface of radius unity be described about any as centre, and let $d\sigma$ be written for the element $\sin\theta \, d\theta \, d\phi$ of surface, then the last written expression becomes

$$\chi(u, v, w)\epsilon^2 \, d\epsilon \, d\sigma.$$

for the same magnitude of the resultant velocity all direc t motion must be equally probable, it follows that the co t of $d\sigma$ in the last written expression must be a function ly, and therefore the number of spheres having component between u and $u + du$, v and $v + dv$, w and $w + dw$

$$\psi(\epsilon) \, d\epsilon \, d\sigma$$

required to find the form of ψ in order that the value of pression may be unaffected by collisions. The solution is, e number of spheres with component velocities between the u and $u + du$, v and $v + dv$, w and $w + dw$ must be

$$A e^{-h\epsilon^2} \, du \, dv \, dw,$$

$$A e^{-h\epsilon^2} \, \epsilon^2 \, d\epsilon \, d\sigma,$$

ing the notation already used

rating with respect to $d\sigma$ from 0 to 4π, we find for the of spheres with velocities between ϵ and $\epsilon + d\epsilon$ the expression

$$4\pi A e^{-h\epsilon^2} \epsilon^2 \, d\epsilon.$$

since the number with component velocities between u and $u + du$, v and $v + dv$, w and $w + dw$ is

$$A e^{-h(u^2 + v^2 + w^2)} \, du \, dv \, dw,$$

$$\left(\sqrt{A}\, e^{-hu^2} \, du\right) \quad \left(\sqrt{A}\, e^{-hv^2} \, dv\right) \quad \left(\sqrt{A}\, e^{-hw^2} \, dw\right),$$

ws that the number of spheres having velocities intermediate n u and $u + du$ parallel to the x axis is

$$A e^{-hu^2} \, du \int_{-\infty}^{\infty} e^{-hv^2} \, dv \int_{-\infty}^{\infty} e^{-hw^2} \, dw;$$

that is,

$$\frac{\pi}{h} A e^{-hu^2} \, du,$$

where A is to be determined by the equations

$$\frac{\pi}{h} A \int_{-\infty}^{\infty} e^{-hu^2} \, du = N,$$

$$A \frac{\pi^{\frac{3}{2}}}{h^{\frac{3}{2}}} = N;$$

therefore

$$A = \frac{N h^{\frac{3}{2}}}{\pi^{\frac{3}{2}}};$$

that is to say, the number of spheres having velocities betwe $\epsilon + d\epsilon$ is

$$\frac{4h^{\frac{3}{2}}}{\sqrt{\pi}} N \epsilon^2 e^{-h\epsilon^2} \, d\epsilon.$$

Multiplying this expression by ϵ, and integrating the prod regard to ϵ from 0 to ∞, and dividing by N, the mean vel all the spheres becomes

$$\frac{1}{\sqrt{\pi h}},$$

and multiplying by instead of by ϵ, we find the mean squa the velocities to be

$$\frac{3}{2h}.$$

In the preceding investigation no account has been collisions between the spheres and the enclosing boundar region in which they are contained, because in every such the magnitude of the velocity of each sphere is unaltered direction is changed according to the ordinary law of r whence it is evident that the distribution is unaffected collisions. Also, the investigation has been confined to t of spheres colliding in pairs, but since there need be no the smallness of the interval between any pair of colli result really embraces the cases of simultaneous collisions three or more spheres; for if a sphere A collides with an and immediately afterwards with a third C, the resultant of A after this second collision must be the same as if it luded with B and C simultaneously.

The foregoing investigation has been given in some detail e principles upon which it proceeds are essentially the those by which all questions of the distribution of energy great number of moving bodies are determined, although i found, as well as the detailed investigations of the result diately following, in published memoirs and systematic tre the kinetic theory of gases.

If the spheres be not all of equal mass, but if there be wi region N spheres of mass m, N' of mass m', and so on, the be proved, by reasoning exactly similar to the foregoing, th the permanent or stable state of motion has been atta number of spheres of the N set with component velocities and $u + du$, v and $v + dv$, w and $w + dw$ is

$$h^{\frac{3}{2}} \, du \, dv \, dw,$$

and the number of the N' set having component velocities u' and $u' + du'$, v' and $v' + dv'$, w' and $w' + dw'$, is

$$A' e^{-\frac{hm'\epsilon'^2}{2}} \, du' \, dv' \, dw',$$

where $\epsilon'^2 = u'^2 + v'^2 + w'^2$, h is a constant t for both sets and

$$A = \frac{N}{\pi^{\frac{3}{2}}} \cdot \left(\frac{mh}{2}\right)^{\frac{3}{2}}, \qquad A' = \frac{N'}{\pi^{\frac{3}{2}}} \cdot \left(\frac{m'h}{2}\right)^{\frac{3}{2}},$$

on if there be any other sets.

The mean velocity and mean square velocity of each sphe set a

$$\frac{2}{\sqrt{\pi}} \sqrt{\frac{2}{mh}} \text{ and } \frac{3}{mh} \text{ respectively,}$$

and the mean kinetic energy of each of such spheres is

$$\frac{3}{2h},$$

the last result being common to all the sets.

If the spheres in the given region be acted on by any giv tending to fixed centres, and functions of the distances of th of the spheres from the centres of force, we may not in s assume, *a priori*, that the chances of velocities in all direc the same; but we may assume that the number of sphere set (N) with coordinates of their centres intermediate

$+dx$, y and $y+dy$, z and $z+dz$, and component velocities
liate between u and $u+du$, v and $v+dv$, w and $w+dw$, is

$$\psi(x, y, z, u, v, w)\,dx\,dy\,dz\,du\,dv\,dw.$$

state of permanence the form of ψ must be independent
me (t), so long as the sphere is moving free from collisions
y other.

the last-mentioned condition it must follow that, if ϕ_1 u,
&c., be any equations among the variables determining the
and motion of any sphere obtained by the elimination of t
equations of motion of that sphere, then ψ must be of the
ϕ_1, ϕ_2, &c.). With the assumption, then, that the number of
of the given set with variables between the above-mentioned

$$\psi(\phi_1, \phi_2 \ldots)\,dx \ldots dw,$$

for the form of ψ, by reasoning like the foregoing,
$\left(\chi + \frac{mc^2}{2}\right)$, where χ is the potential energy of the sphere in
tion x, y, z, and $c^2 = u^2 + v^2 + w^2$, and h is a constant, the
all the sets.

integrate the expression $Ae^{-h\left(\chi + \frac{mc^2}{2}\right)}dx\,dy\,dz\,du\,dv\,dw$
values of x, y, z within the given region, we find for the
of spheres of any set with component velocities between
$+du$, v and $v+dv$, w and $w+dw$,

$$Be^{-\frac{hmc^2}{2}}du\,dv\,dw,$$

we easily see that the chances of velocities in all directions
same, and that the mean velocity and mean square velocity

phere of this set are $\frac{2\sqrt{2\pi}}{\sqrt{mh}}$ and $\frac{3}{mh}$ respectively, and the mean

energy of any such sphere is $\frac{3}{2h}$, and therefore the same for
sets.

ermore, if we integrate the expression

$$Ae^{-h\left(\chi + \frac{mc^2}{2}\right)}dx\,dy\,dz\,dw$$

values of u, v, and w from $-\infty$ to $+\infty$ respectively, we
result of the form $Ce^{-h\chi}dx\,dy\,dz$, and therefore the number
es of the set in question with centres within the elementary
$dx\,dy\,dz$, or, what is the same thing with the exception of a
t factor, the chance of the centre of any sphere of that set
ithin that elementary volume, is $Ce^{-h\chi}dx\,dy\,dz$, so that the
of the N set of matter in the neighbourhood of the point x, y,
$e^{-h\chi}$.

re now in a position to compare the physical properties of a
composed of monatomic molecules in motion, and free
y intermolecular or interatomic force with those of ordinary
long at least as the atoms are spherical.

der two contiguous portions of such a medium separated by
ne parallel to that of yz, and, since the distribution and
of each set of spheres is independent of all the other sets,
onfine our attention to the spheres of the N set. Suppose
ere are N such spheres per unit volume in the neighbourh
f the point x, y, z, whose component velocities parallel to
s of x are between u and $u+du$. The number of these
which cross the elementary area $dy\,dz$ in time dt will be
ne as the number of the dN spheres whose centres are
d within the elementary parallelepiped $dx\,dy\,dz$, in which
qual to udt, and this number is

$$Nu\,dy\,dz\,dt$$

of these spheres carries across with it a momentum parallel
ual to mu; the total momentum parallel to x transferred
$dy\,dz$ in time dt is therefore

$$mNu^2\,dy\,dz\,dt.$$

positive, this is positive momentum transferred from the
e to the positive side of the plane yz; and if u be negative,
negative momentum similarly transferred from the positive
negative side of that plane. In either case it follow that
mere motion of these spheres across the area $dy\,dz$ the
momentum parallel to the axis of x is diminished by the
$mNu^2\,dy\,dz\,dt$ on the negative side of the plane yz,
reased by the same quantity on the positive side of that
the time dt; m being, as before, the mass of each sphere
on the whole, there is a transference of positive x momentum
ime dt across the area $dy\,dz$ equal to $mdy\,dz\,dt\,\Sigma u^2N$, that
l to

$$dy\,dz\,dt\,pu^2,$$

p is the density of the N matter at the point x, y, z, and u^2
mean square of the x velocities.

either by integration or general reasoning it is easily seen
that $u^2 = \frac{v^2}{3}$, where v^2 is the mean square of the resultan
cities of the N spheres, and is equal, as we have proved, to

$$\frac{3}{mh}.$$

Therefore, there is a transference of positive momentum fr
negative to the positive side of the plane yz across the area
time dt equal to

$$\frac{p\,dy\,dz\,dt}{mh}.$$

Each separate sphere whose component velocities are u v
carries across the same area yz and xz momenta equal to mv
respectively, so that in the time dt there are carried across
$dy\,dz\,u$ and xz momenta equal to $\Sigma mvu\,dy\,dz\,dt$ and Σmwu
respectively. By symmetry it is clear that Σmvu and Σmw
separately zero. Therefore, the resultant mutual action of
portions of the medium under consideration in the time dt
transference across the elementary area $dy\,dz$ of a quantity
momentum equal to $pdy\,dz\,dt\,\frac{v^2}{3}$ from the negative to the
side of the boundary plane. If this mutual action, or, as it is
ally called, the pressure when referred to unit of surface, be
by the symbol p, we get the equation

$$p = \frac{p}{3mh}.$$

Since the momenta parallel to x and z remain unalt
follows that the mutual action or pressure between contigu
tions of the medium in the neighbourhood of any point
to the bounding surface at that point. Since also the ex
for p or $\frac{p}{3mh}$ is independent of the direction of the x axi
low that the pressure at any point of the medium in the
all directions.

If the contiguous portions of the medium be separat
material instead of an ideal plane it will be necessary for th
tenance of equilibrium that there should be an action betw
plane and the adjacent medium equivalent to the transfe
momentum estimated above. But action measured by the
unit of time at which momentum is generally continues
force or statical pressure. Hence the force or pressure betw
plane and medium measured to the plane, independent
direction of the plane through the point and equal to the

$\frac{p}{3mh}$ at the point.

When several sets of spheres are present together in the
under consideration, the distribution of the centres and
velocities of each set is, as we have seen, independent of
existence of the other sets. If therefore ρ_1, ρ_2 &c., be the
of the matter of the different sets in the neighbourhood of t
x, y, z, and if p_1, p_2 &c., be the pressures at that point de
above, and if m_1, m_2 &c., be the masses of the spheres of
the sets, and p the total pressure, we get

$$p = p_1 + p_2 + \&c.$$
$$= \frac{\rho_1}{m_1 h} + \frac{\rho_2}{m_2 h} + \&c.$$

Hence we arrive at the following conclusions: (1) the
physical quantity having the same value for every set of sp
namely, the mean kinetic energy of each sphere, or $\frac{3}{2h}$;
quantity be called τ, (2) the distribution of the positi
velocities of the spheres of each set is independent of the
ence of the remaining sets, and is in all respects the same
particular set existed alone in the region considered,
pressure at any point referred to unit of surface at any
the medium arising from the action of any one of the sets
where ρ_1 the density of that particular set at the point m
and τ is the physical quantity above referred to as common
the set.

This third inference may be expanded into the following
laws: (a) if τ be kept constant, then the pressure arisi
each set varies as the density of that set; (b) if ρ_1 be kept c
then the pressure from each set varies as τ, (c) if the
for all the sets be the same, then $\frac{p}{m\rho}$ is also the same, or t
ber of spheres per unit volume is the same.

Now suppose there is a mixture of any number of gase
region; when there is equilibrium there is one physical q
namely, temperature, which is the same for all; the

f this mixture depends, as we know, upon its temperature, energy of these moving spheres is entirely kinetic, and may ed, therefore to be a function of the mean *vis viva*. Let assume that in this medium of moving spheres we have a tation of a mass of gases, and that what is called the ture of the gaseous mass is nothing else than the τ or mean nergy of a single moving sphere. Then, with this assumption, e parts (α, β, γ) of inference (3) above come pond to the laws connected with the names of Boyle, Charles, and e respectively, and inference (2) corresponds with the law on concerning gaseous mixtures.*

ay also deduce the ordinary hydrostatical equations of om from the formulæ which we have obtained.

ince these equations give us

$$p = \frac{P}{\ }, \text{ and } p = m\int_{-\infty}^{\infty} dx \ ^{4}X,$$

$$pX, \text{ and } \frac{d}{\ } = mX,$$

larly

X, Y, and Z are the components impressed force of the s of the space variations of χ along the coordinate axes, therefore, the physical properties of a portion of an aggregate of gases correspond, in all respects, with the physical properties mum consisting of a set of elastic spheres, on of a certain size f such spheres with the sole assumption that the physical termed temperature, in the case of the gas, corresponds, esented by, the mean kinetic energy of a set of the spheres, each sphere representing the chemical atom

are however physical properties of gases which this theory explain. The most important of these is the ratio of the heat at constant volume and constant temperature respect The specific heat of a gas pressure when it is heated under nt pressure is greater than that of a gas heated with a con olume, as when it is confined in a rigid vessel, for the physical reason that in the former case a portion of the converted into mechanical work, namely, that performed by ansion under the constant pressure. The ratio of the specific gas under constant pressure to the specific heat with con olume has been determined for many gases with great ac- briefly from observation of the velocity of sound in such which velocity the value of the ratio to be arrived very im part

on the assumption of the gas being constituted of a number spheres in rapid but irregular motion among each other, physical property of temperature being represented or by the mean energy of each sphere the ratio of these heats must be exactly 1⅔.

v be the volume occupied by a unit of mass of the moving medium, and ρ the number of spheres to be in unit volume, and the density, it follows that

$$\rho = \rho v = 1$$

we know that p, the pressure referred to unit of surface, is given by equation

$$p = \frac{2}{3} \rho\tau,$$

is the mean energy $= \rho\tau v$. If now τ increase from τ to $\tau + \delta\tau$, remains constant, the increase of intrinsic energy must be unit, $\rho\delta\tau$. Also if there be a similar change in τ without ction of τ being constant, but supposing p to be constant, external mechanical work performed equal to $p\delta v$, where ncrease of volume. Also

$$p\delta v = \frac{2}{3} \rho\delta\tau,$$

nce the whole energy required to be supplied from without s is the

$$\rho\delta\tau + \frac{2}{3} p\delta v$$

ratio of the increase to be supplied from without, in order e mean energy of the moving sphere medium should be d by the same amount in the two cases respectively becomes

erefore the gaseous mass be adequately represented by the sphere medium, the ratio of the specific heats must be 1⅔. ury vapour is the only gas for which the ratio has so large as this. Several of the more permanent gases have the qual to 1·408, while in others it falls as low as 1·26. The or mercury vapour, as determined by Kundt and Warburg (*Poggendorff*, clvii. 353), is between 1·695 and 1·631, the mea the observations being somewhat under 1·6. If any valu 1·6 be insisted on it will be impossible to retain the th above enunciated. In point of fact we may say, in anti of what has yet to come, that there is no modification of the theory as hitherto treated which could give a higher value ratio in question than 1⅔.

It follows from what has been proved that either all know and vapours, except the vapour of mercury, and perhaps ca nn t be polyatomic, or else that the attempts to explain the ction of gases by the kinetic theory must be abandone must therefore proceed further to investigate the physic perties of a medium consisting of compound atoms or m built up of atoms in any definite arrangement, such molecul in a condition of irregular motion among themselves, suc have supposed in the cases of the spherical atoms hither sidered

It will be observed on reference to the cases of the spheres investigated, that, whether there be forces to fixed centres i on the medium or not, the chance of any sphere having the nate of its centre and its component velocities between x and $x+dx$, y and $y+dy$, z and $z+dz$, u and $u+du$, v and $v+dv$, w and $w+dw$ proportional to $e^{-hE} dx\,dy\,dz\,du\,dv\,dw$, where E is the total kinetic and potential of the sphere in the state of posit motion defined by x, y, z, u, v, w.

We may generalize this proposition, and prove that w sphere is replaced by a molecule of any shape and constitu as to be defined as to position and motion by r generalized ordinates $q_1 \ldots q_r$, with the corresponding momenta $p_1 \ldots p_r$, the el the molecule having r of these variables between the limit q_1 and $q_1 + dq_1$, p_1 and $p_1 + dp_1$, &c., or, what is the same thing, the nu such molecules at any time with variables thus limited, there be forces to fixed centres or not, and whether inte forces or intermolecular forces are or are not in action on th ecular aggregate, is proportional to

$$e^{-hE} dq_1 \ldots dp_r,$$

where h is a constant, the same for all molecules, and E total energy, kinetic and potential, of the molecule in the s as to position and motion, the potential energy being tha fixed centre forces on the molecule, together with that of i atomic forces in the given position.

The problem before us may be stated thus:—

A number of similar molecules possessing in the whole n of freedom, where n is very large, are in motion in a region bounded by a material envelope, under the action either to fixed centres (called external forces) or of forces between molecules and different parts of the same molecule, as we forces between the fixed boundary and the contained mole of them conservative, so that the total energy, kinetic and p of the aggregate remains always the same; it is required to chance of a grouped any one or more molecules possessin whole s degrees of freedom, defined by the coordinates q_1 momenta $p_1 \ldots p_s$, where s is small compared with n, ha variables between the limits q_1 and $q_1 + dq_1$, p_s and $p_s + dp$

We might start with the assumption made above in th the points under central forces, that this chance must b form

$$\psi(\phi_1, \phi_2, \&c.)\, dq_1 \ldots dp_s,$$

where ϕ_1, ϕ_2, &c., are obtained by the elimin t between the equations of motion of the s group under t centre and boundary forces and those between its componen because there is nothing in the conception of a molecul that of a system with a number of degrees of freedom, a internal forces; and in this case, considering the generali assumption as to the external forces, it would be impossibl erive the existence of any general equation, independent of between the variables, except that of the conservation of e that the chance in question becomes

$$\psi(E_s)\, dq_1 \ldots dp_s,$$

where E_s is now defined, and it remains to determine the f

If we considered a second group of one or more molec having s' degrees of freedom (where s may or may not be s', but, like s, is much smaller than n), and defined by the co and momenta $q_{s+1} \ldots q_{s+s'}$, $p_{s+1} \ldots p_{s+s'}$, then the two groups contain $s+s'$ degrees of freedom defined by the variables and since $s+s'$ is small compared with n, the chance of t having its variables between q_1 and $q_1 + dq_1 \ldots p_{s+s'}$ and $p_{s+s'}$ must be

$$\psi(E_{s+s'})\, dq_1 \ldots dp_{s+s'}$$

But this chance must be equal to the chance of the s gro fixed in the state $q_1, q_1 + dq_1 \ldots p_s, p_s + dp_s$, multiplied by th of the remaining s' group being in the state q_{s+1}, q_{s+1} $p_{s+1} \ldots p_{s+s'}$ $dp_{s+s'}$, where the s group are so fixed.

to find this latter chance we observe that it is the chance of group being in their required limits of position and motion, the internal forces between the r and s group become forces on the s group and fixed centres.

he total kinetic energy of the r group in their given state be d that of the $r+s$ group be T_{r+s}, the total kinetic energy of group must be $T_{r+s} - T_r$.

if the total potential energy of the $r+s$ group under the ce of all forces be χ_{r+s}, this is made up of-

χ_r, the potential energy of the r group to fixed centres, and of its internal forces;

χ_s, similarly taken for the s group; and

χ_{rs}, the potential energy of the r and s group forces.

hen the r group is fixed the potential energy of the s group ced to (2) and (3), or is $\chi_{r+s} - \chi_r$.

refore the chance of the s group having its variables within quired limits when the r group is fixed must be

$$\psi(E_{r+s} - E_r)\, dq_{r+1} \ldots dp_{r+s},$$

fore

$$\psi(E_r)\,\psi(E_{r+s} - E_r)\, dq_1 \ldots dp_{r+s} \quad \psi(E_{r+s})\, dq_1 \ldots dp_{r+s},$$

$$\psi(E_r)\,\psi(E_{r+s} - E_r) \quad \psi(E_{r+s}),$$

fore $\psi(x) = e^{-hx}$ suppose

he chances of the r group having its variables between the q_1 and $q_1 + dq_1 \ldots p_r$ and $p_r + dp_r$ must, in the state of per t or stable motion, be proportional to

$$e^{-hI_r}\, dq_1 \ldots dp_r,$$

was to be proved.

posing now that the aggregate of molecules under consideration consists of a number of sets of similar molecules, the number of ecules in one of these sets being N, where N is very large, pose that each of these N molecules possesses σ degrees of m defined by the coordinates $q_1 \ldots q_\sigma$ with the momenta , and that its mass is m. Three of the σ coordinates may ken as the rectangular coordinates of its centre of mass, in case the corresponding momenta will be mu, mv, mw, where nd w are the component velocities of translation of that centre ss. Then in this case, if $q_4 \ldots q_\sigma, p_4 \ldots p_\sigma$ be the remaining nates and momenta of the molecule, the chance of the molecule variables being within the limits x and $x + dx$, etc., p_σ and p_σ will be proportional to

$$e^{-h(\chi+T)}\, dx\, dy\, dz\, dq_4 \ldots dp_\sigma \qquad \text{(I)},$$

T, the kinetic energy of the molecule, is equal to

$$\frac{1}{2}(u^2 + v^2 + w^2) + \ldots,$$

f is a quadratic function of the p's, having as coefficients functions of the q's.

e integrate the expression (I) for all possible values of $p_4 \ldots p_\sigma$, we obtain an expression of the form

$$Be^{-h\frac{m}{2}(u^2+v^2+w^2)}\, du\, dv\, dw \qquad \text{(II)},$$

B is independent of u, v, and w, and $\frac{m}{2}(u^2+v^2+w^2)$ From m of (II) it follows, exactly as in the case of the elastic spheres, he chances of all directions of the velocity of translation of a ule are equal, that the mean velocity and mean square velocity nslation of each molecule are

$$\frac{2}{\sqrt{\pi}}\sqrt{\frac{1}{mh}} \text{ and } \sqrt{\frac{1}{mh}}$$

tively, and that the mean kinetic energy of translation is the same for a molecule of any set.

in, if T' be the mean total kinetic energy of the mole

$$T' = \frac{\iiint \ldots T e^{-h(\chi+T)}\, dx \ldots dp_\sigma}{\iiint \ldots e^{-h(\chi+T)}\, dx \ldots dp_\sigma}$$

we evaluate this expression, paying attention to the form of quadratic function of the p's mentioned above, we shall find I) the expression $\frac{\sigma}{2h}$.

ollows from this result that each additional degree of molecule increases the mean total kinetic energy of the mole y the quantity $\frac{1}{2h}$, which is the mean kinetic energy of trans- parallel to any one of the axes, and that the total kinetic is proportional to the number of such degrees of freedom.

again, we integrate the expression (I) for all values of the nta, we obtain an expression of the form

$$Ce^{-h\chi}\, dx\, dy\, dz\, dq_4 \ldots dq_\sigma \ldots\ldots\ldots\ldots \text{(IV)}.$$

χ is the potential energy of the molecule due to fixed centres and to interatomic forces in the position defined by x, y, z, The dimensions of the molecule are so small that we may forces from each fixed centre on different parts of the mol parallel and equal and functions of the distance of the mass from that fixed centre, so that, if the part of χ arisi these fixed centre forces be called χ_1, χ_1 will be a function and of these variables only, the remaining part of χ (arisi interatomic forces), which may be called χ_2, will be a fun the $\sigma - 3$ variables $q_4 \ldots q_\sigma$.

If in (IV) we write $\chi_1 + \chi_2$ for χ, and then integrate for a of $q_4 \ldots q_\sigma$, we obtain an expression of the form

$$De^{-h\chi_1}\, dx\, dy\, dz,$$

where D is independent of x, y, z, and therefore ρ the de the N molecular matter in the neighbourhood of the point x

$$\rho = De^{-h\chi_1}.$$

From the result all the propositions proved above with r to the aggregate of elastic spheres or monatomic molecules, correspondence of the physical properties of such an aggreg those of gases as indicated by the gaseous laws, may be also for this aggregate of polyatomic molecules. So that equal to $\frac{3}{2h}$, or the mean kinetic energy of agitation of an the aggregate of moving molecules. If v be the volume occ unit of mass, ρ the number of molecules in unit of volume the mass of each molecule, we have, exactly as in the case to,

$$mv = 1, \quad p = 1,$$

and

$$p = \frac{2}{3}\rho T.$$

We also get the ordinary hydrostatical equations

$$\frac{dp}{dx} = \rho X, \quad \frac{dp}{dy} = \rho Y, \quad \frac{dp}{dz} = \rho Z$$

from the expression for p combined with the equation

$$\rho = mDe^{-h\chi_1},$$

remembering that

$$\frac{d\chi_1}{dx} = -X,$$

whence the correspondence of the physical properties of this po polyatomic monatomic molecule with those of a gas, on the tion that the temperature represents the mean kinetic e agitation, is at once apparent.

It can be shown also that the aggregate of moving mo such as we conceive gases to be, possesses another very im physical property which, by its analogy to the second law of dynamics, affords additional evidence of the relation betw phenomena of heat and those of aggregation in one kind of m the property in question being that if in any aggregate of molecules the mean kinetic energy of any one of them be , and if δQ be an increment of energy imparted to the a from without, then $\int \frac{\delta Q}{T}$ a perfect differential.

If to this aggregate we apply a certain small quantity δQ or energy from without, and if δT be the increase of th kinetic energy of agitation, while the volume is unaltere the containing vessel prevents any of the energy δQ fro absorbed in doing external work, but it is conceivable t increase of T may cause such a change in the average fat molecule as to produce a variation $\delta\chi$ in the mean potentia of the molecule, $\delta\chi$ being proportional to δT.

Therefore $\int \frac{\delta T}{T}$

But

$$\int \frac{\delta\chi}{T}$$

therefore

$$\int \frac{\delta\chi}{T}$$

If the volume vary by $\delta\tau$, the pressure being constant, then additional external energy, to the energy absorbed, so that if external energy now applied be $\delta Q'$, and the increase of temperature δT be the same in both cases, we have

$$\delta' Q = p\left(\frac{\sigma}{3} + \frac{d\chi}{d\tau}\right)\delta\tau + \rho\delta\tau$$

$$\delta Q = p\left(\frac{\sigma}{3} + \frac{d\chi}{d\tau}\right)\delta\tau$$

But if p be constant, then as before

$$p\delta\tau = \frac{2}{3}\delta\tau,$$

refore the ratio of $\delta'Q$ to δQ, or of the two specific heats at
t pressure and constant volume respectively, becomes

$$\frac{+3\frac{d\chi}{d\tau}+2}{\quad}$$
$$\sigma \quad 3\frac{d\chi}{d\tau}$$

nice we in all respects except that it must be positive; also
s that s must be integral and not less than 3, if we denote
s we have for the ratio

with the necessary limitation of σ and s cannot be greater
or 1·6, and in the limiting case the gas must be mon-

refore any value above 1·6 of the ratio for mercury vapour
ted upon the theory must be abandoned so far as present
ations are concerned. It, however, the difference between
any higher value given by the observations be regarded as
erstable limit of experimental error the value for mercury
a gas which on chemical grounds is ranked as monatomic,
viewed in conformity with the theory of Boltzmann
spherical atoms were united by attraction to form a molecule
h a molecule would have five degrees of freedom and the
heat ratio would in this case be 1·4. Now 7 would then be
The value 1·4 is a plausible approximation to the observed
lts of the determination of a number of two-atom gases such
ogen, nitric oxide, oxygen and others, but all observations
ommitted in the ratio 1·408 or from 1·405 to 1·408 that
e seems reasonable to regard the difference ·008 as within
it of experimental error, unless indeed we had grounds
ecting a certain one of all the methods employed for
ermination of the ratio. But there are other difficulties
mmediately arise from the spectroscopic properties of
ases. The atoms emitted by such gases, so long as they are
heat density never present a continuous spectrum but a
n consisting of bright lines with intervening dark spaces.
e spectrum of hydrogen we thirty-two bright lines, that
ny upon a line that of nitrogen fifteen, and so on.
s light is recorded it is the case with intermittent disturbance
d light of definite refrangibility due to vibration of
eriod, we must regard the even continuous spectra as consisting
with, and arising from vibrations of determinate periods in
ecule of the heated gas. Now if a gas such as hydrogen or
be constituted as we are supposing of an indefinite number
similar molecules it must follow that each molecule must
ble, at any rate when not too closely packed together, of as
dependent vibrations as there are bright lines in the spectrum
hat is to say, in addition to the three degrees of freedom
from motion of translation in which each molecule
sses an indefinite number of additional degrees of freedom of possible
motion of its parts which are indicated by the number of periods
ne. The degrees of freedom corresponding to motion of
ion cannot well contribute anything to the specific heat
n owing to their assumed irregularity and independence of
, but it is otherwise with the internal or relative degrees of
of each molecule. For, unless the gas be very dense, we may
ceive a sufficient interval of time between one encounter
next of any molecule with another for many vibrations
ch according to its own law, to take place in the relative
of different parts of the molecule. At each encounter the
ecules would be forcibly shaken, and when the encounters
e frequency the vibrations would become irregular and
trum would become, to use a general diffused light of no
ticular clarity just as matter degenerates into ordinary noise
ses the distinct bright lines in the spectra of these gases.
ing the theory, therefore, into agreement with observed
ena, we require very many more degrees of freedom in each
than could possibly be assigned to it in accordance with
erved value of the ratio of the specific heats, namely
for example, consistently with difficulty the minimum number
such degrees, as we have just now seen, while its spectrum
equires at least nine. And the difficulty increases as we pass
ogen and others.

ught perhaps conceive with the view of possibly explaining
culty, that there were in all gases a number of composite
es with many degrees of freedom mixed up with the others
es with three or five such degrees, but in so small a proportion
these molecules that their presence produces no appreciable
on the specific heats; or, since we have no experimental de-
tion of the specific heats of gases at light-giving temperatures
we might, at least until such experimental determination
arrived at, conceive that our atoms may change their con
under increased temperature, and become themselves ca
vibration. There is nothing in the conception of an atom a
considering it which is really inconsistent with such an hyp

Certain observed phenomena accompanying dissociation a
bination give rise to other difficulties in the way of the ne
of the kinetic theory in addition to those arising from th
distribution of mean kinetic energy just now discussed. F
nitrogen and hydrogen for example, are mixed in proportion
ammonia it is observed (1) that at ordinary temperatures
not exhibit the slightest tendency to combine directly w
other, while, on the other hand, (2) ammonia at ordinary temp
does not exhibit the slightest tendency to decompose into
or hydrogen. But ammonia when subjected to certain v
temperature becomes partially decomposed that is, be
mixture of so many parts of ammonia and of so many oth
of nitrogen and hydrogen in the proportions to form ammon
if the temperature be high enough the decomposition may
plete. But, in accordance with the kinetic theory, the co
whatever they may be which at high temperature cause the a
to decompose, must sometimes occur to individual mole
ordinary temperature, because temperature, as we unders
merely indicates a certain quantity of kinetic energy, and t
in a gas, however cold, there will be always some molecu
tate for dissociation and this dissociation having taken p
by it never be compensated by recombination; therefore
tion should be going on in ammonia at all temperatures,
ult is contrary to the observed phenomena (2). It might
conceived, a way of meeting this last-mentioned difficu
the dissociation attendant upon high temperature—that is,
average large molecular velocity of translation requires th
should be a fairly rapid repetition of encounters among m
moving with dissociation velocity to ensure the production
sociation and that in the case of a gas at low temperature,
average velocity the chance of two molecules encounter
another at high velocities is small, and the chance of any
meeting with any rapid succession of such encounters is pr
inappreciable and therefore that the dissociation spoken of real
takes place.

As above stated, we conceive that in any gas at ordinary
and temperature the intermolecular forces are very smal
aggregate that is, in Clausius's language, have a very small
by which is understood, not that the forces themselve
acting, are small, but that, considering the whole aggr
molecules at any instant, there are very few pairs near e
each other to exert any appreciable force on each other.
could watch any individual molecule for any time, we sho
that during by far the greater portion of the time it was
free from any action by surrounding molecules. The
traversed by the type molecule between the instant when
out of the sphere of action of one molecule and the insta
it passes into the sphere of action of the next—that is, f
encounter to another is called its *free path*.

We may find the chance that a molecule starting from a
with velocity ω in a uniform gas shall have free path be
and $x+dx$ from that point.

If a be the chance for such a molecule of free path *at leas*
then a^2 is the chance of a free path at least 2. Hence th
of free path at least x must be of the form a^x.

Following the method employed by O. E. Meyer,[1] let
this in the form

where therefore

$$l = -\frac{1}{\log a};$$

then the chance of free path $x+dx$ is

$$\frac{x+dx}{l}.$$

The chance that such a molecule shall have its first en
between x and $x+dx$ is the difference of these two expr
that is,

$$\frac{dx}{l}$$

This is the chance of a free path between x and $x+dx$.

The mean free path for such a molecule must then be

$$\int_0^\infty e^{-\frac{x}{l}}\frac{x}{l}dx = \int_0^\infty e^{-\frac{x}{l}}\frac{x}{l}dx = l.$$

This is the meaning of the constant l in $e^{-\frac{x}{l}}$. But if w
by E the number of encounters which a molecule moving
space with velocity ω experiences on the average per unit o

[1] *Kinetische Theorie der Gase*, Breslau, 1877.

the kinetic theory of gases presents to us the conception of lly perfect rest, as the result of motion maintained in detail manent and stable on the average. Whatever difficulty felt at first sight in the acceptance of this theory in the medium at rest is greatly enhanced when we pass to the blation of a disturbed medium like a mass of air through wave of sound is passing. In our ordinary investigations a disturbance the gas is treated as a continuous body, sub- small relative motions of its parts, accompanied by corre- g variations of internal pressure. When a disturbance or a ndensation or rarefaction is set up in any portion of this gas late the resulting effects by the well known equations of otion. But on this kinetic theory the medium is supposed st of a number of discrete masses—elastic spheres or the hich preserve the physical properties of the medium merely ecurrence of their mutual collisions, such collisions obeying in individual cases, but preserving a certain ave in the motion of the whole aggregate, and we need some investigation to assure ourselves of the applicability of the treatment of wave motion to such a medium.

we observe that the physical properties of our medium, so he relation between pressure, density, and temperature is ed, merely require that the temperature be measured by the tal kinetic energy of translation, and that the mean kinetic of translation parallel to any fixed line be equal to one third hean total energy of translation. If the molecules constituting portion of this medium were animated by a common velocity eration, the physical properties of this portion would be y determined by the velocities and kinetic energies relative ommon motion. When the distribution of such relative velo stable or permanent, the average relative kinetic energy in d direction is one-third of the average relative total kinetic such property constituting normal distribution.

ose that in any portion of a medium, consisting of equal spheres, this distribution has been disturbed that is, Σmu^2, and Σmw^2 are unequal. If V were the relative velo- any pair of spheres after such disturbance and before they and θ the angle between V and the common normal at the impact, then the normal and tangential relative velocities before impact are $V\cos\theta$ and $V\sin\theta$, and after impact they - $V\cos\theta$ and $V\sin\theta$ respectively. The relative velocity af pact, resolved in the direction of relative velocity before im therefore

$$V\cos^2\theta + V\sin^2\theta,$$

or $V\cos 2\theta$; and the chance of θ being between θ and $\theta + d$

$$\sin 2\theta\, d\theta.$$

Therefore the average square relative velocity resolved original direction becomes after impact

$$V^2 \int^{\pi} \cos^2 2\theta \sin 2\theta\, d\theta \text{ or } \frac{1}{}.$$

The relative velocity after impact in the plane of V normal perpendicular to the direction of V before impact is

$$V\sin\theta\cos\theta - V\sin\theta\cos\theta, \text{ or } V\sin 2\theta.$$

And if a fixed line be taken in the plane perpendicular to average value of the square of the relative velocity after resolved parallel to this line

$$\frac{1}{\pi} \int_0^{\pi} \int_0^{\pi} \quad \text{or} \quad \text{below}$$

Hence we conclude that, in whatever manner the distribu on turbulent motion any portion of the medium at any instant, if w all those pairs of spheres which within any given interval en velocities have a mean of the normal distribution after that m

D denote the average time between two collisions for an sphere, the chance that the sphere will continue for any free from collisions is $e^{-\frac{t}{D}}$; we have seen that

If, therefore, D be the number of spheres within any region total relative velocity is between w and $w + dw$, but so distri- that the mean square of their relative velocities along a line not $\frac{w}{3}$, then after a time t considerably greater than the time τ the number of the D spheres which have encoun- tered will be utterly inconsiderable and the distribution will become normal throughout the region.

Suppose, for instance, that a sound wave is passing along a tube filled with air, so that

$$C \qquad E \quad P \quad C \qquad L$$

$$(5)$$

the air in the tube is, at any instant, in a state of alternate pression and rarefaction, so that C, E, C, E above.

If the note sounded be say 500 vibrations per second, the of the wave CE is about $\frac{1}{10}$ feet and the time taken by the in traversing that distance is about $\frac{1}{1000}$th of a second.

The air in any section of the tube next E is alternately positive momentum and an equal amount of negative momentum reversal taking place twice every $\frac{1}{1000}$th of a second; also the am which produces the average momentum in either case is the distribution of energy among the u, v, and w directions, always producing an excess or defect in uu above or below vv and ww. By what has been proved above, this distribution of energy becomes inappreciable owing to mo collisions in a time considerably less than $\frac{1}{1000}$th of a sec fact, in about $\frac{1}{1000000}$th of a second when the value of atmospheric air is considered. It is therefore legitimate, in lating the velocity of sound in air at first on the elastic hypothesis, to regard the distribution as always normal section of the tube, the air in that section or in any elem portion of it possesses in any kind of velocity or ac tion, estimated as if we were dealing with a continuous mas

Diffusion of Gases

If any further light is to be thrown on the pl nature of a molecule from investigations, experimen analytical, concerning gases, it will most probably means of experiments on the diffusion of gases, or the internal friction or viscosity of gases, and the parison of these results with those obtained analy by the methods of the kinetic theory. Such inv tions have been undertaken experimentally by Cr Loschmidt, Maxwell, O. E. Meyer, and others. count of them will be found in O. E. Meyer's work referred to. The same problems have also been dis analytically by Maxwell,[1] and by Stefan, O. E. Meye Boltzmann in the treatises referred to below. We ceed to give a short account of Meyer's results.

[1] *Phil. Mag.*, July 1860, and Feb. and Mar. 1868.

... A is

$$N_a - \frac{1}{3}\frac{dN_a}{dx}\{\omega'_1 \ldots \omega l_a\} .$$

... the total surplus number of molecules of gas A passing
... unit area of the plane per unit of time is

$$\frac{1}{3}\frac{dN_a}{dx}\{N_a - \ldots \omega l_a) + \omega l_a\}$$

$$\frac{1}{3}\frac{dN_a}{dx}\{N_b\,\bar{\omega}l_a + N_a\,\overline{\omega l_b}\}$$

or

$$\frac{1}{3N}\frac{dN_a}{dx}\{N_b\,\bar{\omega}l_a + N_a\,\overline{\omega l_b}\}$$

The expression

$$\frac{1}{3N}\{N_b\,\bar{\omega}l_a + N_a\,\overline{\omega l_b}\}$$

is defined to be the "coefficient of diffusion" of gas A into gas B. It is evidently the same as that of gas B into gas A.

The Relation of the Coefficient of Diffusion to Density.—It can be shown that l_ω, the mean free path for a molecule having velocity ω, is for any single gas inversely proportional to the density, and for any mixture of gases inversely proportional to λ, the aggregate volume ... cupied by matter in unit space. Hence, in the expression $\frac{1}{3}\omega l\frac{dN}{dx}$, ωl is inversely proportional to the density, or to λ, as the case may be.

Now the rate of diffusion on this theory depends upon $\frac{1}{3}\frac{dN}{dx}\bar{\omega}l$. Hence, given the absolute increase of density of a gas per unit of length, that is, given $\frac{d\lambda}{dx}$, the rate of diffusion ought to vary inversely as the density of the combined gases. On the other hand, given the proportional increase of the density, or $\frac{1}{\lambda}\frac{d\lambda}{dx}$, the rate of diffusion ought to be independent of the density, because in that case $\frac{d\lambda}{dx}$ varies directly, and ωl inversely, as N. The analytical result that at given temperature, and given the absolute value of $\frac{dN}{dx}$, the rate of diffusion is inversely proportional to the density of the gases agrees with the experimental results obtained by Loschmidt for carbonic acid gas and air, carbonic acid gas and hydrogen, hydrogen and oxygen.[1]

Relation of the Coefficient of Diffusion to Temperature.—The coefficient of diffusion varies directly as the square root of the absolute temperature, for

$$\omega l = \frac{\omega'}{B},$$

$$B = 2Ns^2\sqrt{\pi}\left\{e^{-h\omega^2} + \frac{2h\omega^2+1}{\omega\sqrt{h}}\int_0^{\omega\sqrt{h}} d\mu\, e^{-\mu^2}\right\};^2$$

$\omega\sqrt{h} = y$,

$$B = 2Ns^2\sqrt{\pi}\left\{e^{-y^2} + \frac{2y^2+1}{y}\int_0^{y} e^{-\mu^2}d\mu\right\}.$$

Hence

$$\frac{1}{B} = \frac{\sqrt{h}}{\sqrt{\pi}Ns^2}\psi(y),$$

where ψ denotes a certain function, and

$$\left(\frac{\omega}{B}\right) = h^{\frac{3}{2}}\int_0 d\omega\, e^{-h\omega^2}\frac{\omega^4}{B}$$

$$= h\int_0^{\infty} dy\, e^{-y^2}\frac{y^4}{h^2}\frac{1}{B} = \frac{1}{\sqrt{h}}\int_0^{\infty} dy\, e^{-y^2}\, y^2\psi y = \frac{1}{\sqrt{h}}.$$

The analytical result also agrees fairly with Loschmidt's experiment above referred to.

Friction or Viscosity of Gases.

Suppose two layers of gas separated by an imaginary plane, similar in all respects except that the molecules on one have a small common momentum in a certain direction parallel to the plane. We may take the imaginary plane for that of y, and the average direction of motion of the molecules on one side of the plane, *e.g.*, the left-hand side for the axis of y, the molecules on the right-hand side of the plane having no average momentum. Then the molecules crossing from the left to the right side carry with them an average momentum in the direction y, and so tend to impress the right-hand stratum of gas with that momentum. On the other hand, the molecules of the right-hand stratum crossing the plane into the left-hand one have, relatively to the molecules in the latter, an average momentum in the opposite direction, and therefore tend to diminish the average momentum of the left-hand stratum

[1] *Sitzungsberichte*, 1870, Bd. lxi. S. 380. [2] See Meyer's *Kin. Theorie*, p. 29

if we attempt to cause one stratum of gas to pass
nother in parallel planes, we experience a resistance
the interchange of molecules between the portions
separated by the plane. This is in some respects
ous to sliding friction between solid bodies, and is
y German writers the "friction" (*Reibung*), by Max
l others the "viscosity," of the gas. Meyer[1] inves-
his effect of friction in a manner somewhat similar
employed in case of diffusion, and obtains for the
ent of viscosity $\frac{1}{3} mNvol$.

on of the Coefficient of Viscosity to D

The viscosity of a gas is independent of t
g to O. E. Meyer, $\frac{mN}{3} vol$. Now, for an
seen, inversely proportional to the den
ersely proportional to the density. On t
ly proportional to the density. Hence t
nt of the density. The agrees with th
well from the kinetic theory in 1860, an
uments by Maxwell[2] and O. E. Meyer.
Meyer and Springmühl[3] on the *Visco*
times in which two different gases mak
flow through a tube maintain the same
ther. As in the case of the coefficient
y proportional to the square root of the de
the coefficient of diffusion and that of
ame function ω, it should be po sible
to determine the rate of diffusion. Ex pe
ave been conducted by Stefan[4] with res
ulated values for the coefficient of diffu
with those determined by Loschmidt, also
ve given the above results for the coefficient of diffusion
osity from O. E. Meyer's work, he uses a method to meet
ry general acceptance. It has been shown however by
nn,[7] that the method is incomplete. Meyer's results are
obtained on the assumption that the molecules of a gas
ing diffusion or internal friction, which have no resultant velo-
y, are moving with that velocity in all di
calculate the number of molecules
ough a given plane during a short

molecules, issuing from each encounter with velocity
ndifferently in all directions, we get on Meyer's result
sumption is true only of a gas at rest that is, having no
of translation so that our result as obtained would express
of diffusion, the rate at which two gases *begin* to diffuse
any instant both at rest that is with no translational velo
ixed in unequal proportions in different portions of sp
actual case of diffusion, either of the two diffusing gases
a small velocity of translation. If we take this velo
ount in calculating the number of molecules of the
through a plane, according to Meyer's method, we
t it introduces two new terms, one of which, when
becomes steady, is equal and opposite to the result obtai
er. This is proved by Boltzmann in the case of viscosity
tise above referred to. The same proof is easily applie
of diffusion.

Stefan's Method.—Stefan[8] regards the two diffusing gases
small velocities of translation, or stream velocities, in
opposite directions, so that the molecules of one gas
, have an average momentum $m_1 u_1$ in direction from
, and those of the other gas, of mass m_2, an average
$m_2 u_2$, from right to left. By virtue of encounters between
sets of molecules, each gas is always imparting to
portion of its own average momentum, and receiving
e other a corresponding momentum in the opposite di
The momentum so transferred or interchanged per
alls the *resistance* which one gas offers to the other—diffu
investigation Stefan assumes that all classes of molecules
gas, whatever their molecular velocity may be, have
erage velocity in the direction of diffusion—that is, the
velocity—so that the motion of the molecules of a diffu
ld be exactly represented by considering the molecules
est—that is, with only its molecular velocity—at the

temperature and pressure, and then giving to each molec
additional common velocity u in the direction of diffusion.
mann, however, shows that, in order correctly to represent the
of the diffusing gas, we must impart to molecules having
molecular ve independent of direction different
velocities in the direction of diffusion. And it will be fou

estimate of molecular dimen

It is first necessary to decide what is meant
dimension of a molecule. If a molecule is an elastic
it has dimensions with the exception of which
familiar. It is not of course seriously contended
physicists that the molecules of a gas are actual
elastic spheres, or exert no force on each other at a
tance greater than that of actual contact, and t
infinite force. But it is necessary to conceive the fo
finite, although they may approach or rapidly with
tance at the collisions of molecules in the ac
differ little from what they would be if the molecul
ideal elastic spheres. Nevertheless, they must h
ence; and, that being the case, it is difficult, if
ible, to frame a definition of the boundary of
ule, except as a certain surface at which the force
ween the molecule in question and other mo
tain a certain value.

If for instance, we were to regard a molecule as centre

where λ is the ratio which the aggregate volume of all the

spherical molecules in unit volume bears to unit volume. If K, the specific inductive capacity of mercury vapour, can be determined experimentally, the equation $K = \frac{1 + 2\lambda}{1 - \lambda}$ affords a means for estimating the value of λ,—that is, the aggregate volume of the molecules.

Another method, originally proposed by Van der Waals, is based on the small deviations from Boyle's law observed in a gas. Suppose a vessel of volume V containing a number N_1 of small spheres, each of mass m, moving with a certain average velocity. Let p_1 be the pressure. Let a second class of small spheres, in number N_2, each of the same mass m as the former and having the same average kinetic energy, be introduced into the vessel. If the second class of spheres could freely penetrate the first, and were not impenetrable, so that there should be no restriction to the sphere of the first class and a sphere of the second being in the same place at the same time, then the pressure on the wall of the vessel would be increased in the exact proportion $\frac{N_1 + N_2}{N_1}$, and Boyle's law would be exactly fulfilled. But if the spheres cannot penetrate each other, the volume occupied by the second class of spheres is not V but $V - \frac{4}{3} N_2 \pi r^3$, if r be the radius of a sphere of the latter class. Consequently, the pressure due to the second class of spheres is rather greater than it should be, and there is a deviation from Boyle's law. Van der Waals treats the pressure as proportional to the number of encounters, and therefore as inversely proportional to the mean free path, which is evidently diminished by any increase in the magnitude of the spheres, and diminished more than in proportion by any increase in the number.

(H. W. W. S.)

CHEMICAL ASPECT.

The word *Molecule* is used by chemists to express the smallest quantity of a pure substance, that quantity of it which its formula ought to represent. What this quantity is, in any particular case, must be ascertained by studying the chemical reactions by which the substance is produced and the chemical changes which it undergoes. We may give one or two illustrations as to how how this can be done, as well as to indicate the limits within which these methods can be applied.

The formula usually assigned to acetic acid is $C_2H_4O_2$. This agrees with almost all the chemical actions in which it takes part. Thus, one quarter of the hydrogen is replaceable by other metals, as in $C_2H_3KO_2$, &c.; and in chlorine, two, or three quarters of the hydrogen can be replaced by chlorine. There must, therefore, be four (or a multiple of four) atoms of hydrogen in the molecule. Similarly, half of the oxygen can be replaced by sulphur, and one quarter of the oxygen along with one quarter of the hydrogen can be replaced by chlorine. There must, therefore, be two (or a multiple of two) atoms of oxygen in the molecule. Again, the formation of marsh gas and carbonato of soda when acetate of soda is heated with caustic soda, and the formation of aceto-nitrile from cyanide of potassium and iodide of methyl, show that the carbon in acetic acid is divisible by two, or that the molecule contains two (or a multiple of two) atoms of carbon. $C_2H_4O_2$ is the simplest formula which fulfils these conditions, but the existence of an acid acetate of potash and an acid acetate of ammonia, the formulæ of which are usually written $C_2H_3KO_2.C_2H_4O_2$ and $C_2H_3(NH_4)O_2.C_2H_4O_2$, as if these were compound derived from two molecules of acetic acid, would lead us to $C_4H_8O_4$, as this shows that the hydrogen is divisible by eight. In the same way, we can easily convince ourselves that $C_6H_{10}O_5$, *or some multiple of it*, is the formula of starch; that C_8H_5NO, *or some multiple of it*, is the formula of indigo blue, and so on. But it is not easy to determine by purely chemical methods whether these formulæ themselves, or multiples of them, really represent the molecule. A simple formula may suffice for the many of the reactions of a substance, and may even represent a great many of its derivatives, and yet reactions and derivatives may be discovered which require a multiple of that simple formula. This has already been indicated in reference to acetic acid, and a very s

tion is supplied by mellitic acid. For a long
e formula $C_1H_2O_1$ was used for this acid, and by
of it all the then known derivatives were repre-
But later investigations by Baeyer proved that
rmula must be multiplied by three, the new deriva-
tained by him not being capable of representation
y formula simpler than $C_{12}H_6O_{12}$. Very many ex
of the same kind might be adduced, but those given
rve to show the nature of the difficulty of settling
rmula and with it the molecular weight of a sub
It need scarcely be said that the multiple formula
nts everything which the simple formula repre ents
mething more, and that chemists as a rule take the
t formula which will answer the purpo . The
al methods of determining the formula and mole
eight apply equally to all pure sub tance , but they
give us absolute values, only numbers to which
lecular weights are proportional. And for purely
l purposes these are all that we require. Thus
a chemist speaks of acting on a molecule of ne-
cid with two molecules of pentachloride of pho
he means that he mixes them in the proportion
parts of the former to 2 1775 of the latter
e sake of precision we sometimes speak of a mole
water (or other substance) in grammes, or even of
me-molecule, a *gram molecule*, &c. Thus in the case
ntioned a gramme molecule of succinic acid means
ammes of succinic acid, &c.
while for practical purpose these proportional
rs are quite sufficient, we cannot leave out of view
lation to the actual constitution of matter. There
l reason to believe that matter consists of discrete
es, and that every pure substance is made up of
portions of matter, all alike, so that one of them, if
ld examine it, would give us a complete idea of
emical composition, constitution, and character of
bstance. These small portions, of which the smallest
ty of the substance which we can examine contains
millions, we may call *molecules*. From the character
we have supposed this molecule to possess, viz., that
y represents all the chemical properties of the sub
- it will be seen that these *real, absolute* molecules
be proportional to the molecular weight ascertained
mical means; so that, while for practical laboratory
nufacturing purposes we use the gramme, the pound,
ton as our unit, and speak of its grammes, pounds,
s, as the case may be, of water, as a molecule (or
e molecule, ton molecule, &c.), in dealing with the
constitution of matter we should use as our unit
ass of a single atom of hydrogen, and our gramme
le would then be a definite, very large, but not yet
tely ascertained, number of real molecules.
has been already shown above that, on the kinetic
of gas, a gas consists of a number of particles
g about in straight lines in all directions, and that
omogeneous gas which follows Boyle and Charles's
these particles are all alike. The masses of the
es of different gases are therefore to one another in
me proportion as the densities of the gases, temperature
nd pressure being the same. Thus in gases, the in
dently moving particles of the kinetic theory are the
les of which the chemist is in search, and it becomes
tant that we should compare our chemically found
lar weights with the densities. Theoretically accu
esults could be obtained only in the case of a perfect
out small deviations from Boyle's and Charles's laws
t interfere with the application of this method.
ical methods, as we have already seen, lead us to a
lar number, *or a multiple of it*, so that our choice is
le limited to two or three numbers widely differing
from one another. We find that if we do not exceed
limits of chemical stability a gas approaches the state
perfect gas as the temperature increases, or as the
sure diminishes. Now if one of the numbers re
probable by chemical evidence *nearly* coincides with
given by comparison of gas densities, under cond
where the substance sensibly deviates from Boyle
Charles's laws, we find that by diminishing the pres
increasing the temperature within the limits of ch
stability, and thus bringing the substance nearer the
of a perfect gas, the correspondence between these
numbers becomes closer. This has already been p
out and illustrated in the article CHEMISTRY, vol. v. p
We can now compare the results in the case of
of the chemical and of the physical determinat
molecular weight, by giving some examples, placin
by side the formula and molecular weight adopt
chemist and the mass in grammes of the gas occ
the volume of 22·33 760 *p* (27·4 + *t*) 273 litres.
volume is that which one gramme of an ideal gas
the molecular weight 1, and perfectly following
and Charles's law would occupy at pressure *p* milli
of mercury and temperature *t* C. If, then, *w* be the
cular weight of any gas, *w* grammes of it should
this volume, and the deviation from this would n
light deviation from Boyle and Charles's laws.
annexed table *w* is the molecular weight and *m* th
contained in 22·33 760 *p* (27·4 + *t*) 273 litres
the temperature is not specially stated the determin
were made under the normal atmospheric conditions.

	H =	*w*	*m*
Nitrous oxide		44	44·04
Ammonia			
Carbonic oxide			
Marsh gas			
Olefiant gas			
Hydrogen			
Argon			
Sulphur

Osmic oxide			
Perchloride of phosphorus			
Sulphide of arsenic			

A comparison of the values of *w* and *m* leads to the following conclusions:

(1) In the case of a very great number of substances which exist in a few reactions are given in the table two determinations agree, the slight differences observed being evidently due to deviation of the gases from the laws of a perfect gas. (2) In a considerable number of cases, physical evidence has been adduced that the molecule of the gas is a multiple of the simplest number satisfying the chemical condition. This cannot be looked upon as a coincidence between the methods, because, if a particular formula be the chemical condition, any multiple of it will satisfy the same, and indeed, in many of the cases we are considering it is impossible from chemical considerations to say that the higher molecular weight actually adopted, although such chemical considerations might in all cases have warranted its adoption without physical support. Thus, we are not without chemical evid

of the formula $H_6Cl_2O_3$, or even Al_2Br_6 and Fe_2Cl_6, gh chemists would probably have contented themwith H, Cl, O, $AlBr_3$, and $FeCl_3$ had it not been for idence of gas and vapour density, and certainly with latter no one would have thought of P_4, As_4, or S_6.[1] here are a number of substances in the case of there is an apparent disagreement between the of the two ways of determining molecular weight. substances are said to have an anomalous gas or density. The expression anomalous vapour density time applied to the case of such substances a orms and arbitrary, but not very accurately. It be better to say that these substances have an *tal* vapour density, because their complex molecular e, while not clearly indicated by their chemical ter, are not at variance with any established law shall therefore reserve the term "anomalous vapour " for those substances the molecular weight of as given by their vapour density is not reconcilable any formula which is chemically admissible. In e of some substances, such as the oxid of chlorine, been shown that the discrepancy was due to erroervation, impure specimens having been used in periments, but there still remain many substances, in the sense above indicated, anomalous vapour . The substances have therefore been examined pecial care, with the result of completely vindicating ne the theory, and of disclosing a very interesting theoretically important kind of chemical change. We ake, as instances of such anomalous vapour densities, bstances in the last division of the table, and show e anomaly here in the case has been explained.

ammoniac has the composition represented by the a NH_4Cl. The formula agrees with all the chemical of the substance and of all the substances in any lated to it, but it does not agree with the results of density determinations. When sal-ammoniac is it is converted into a mixture of gases, and the vapour is reconverted into solid sal-ammoniac when it is This looks exactly like the process of sublimation, was universally supposed that the vapour given n sal-ammoniac is heated was really sal-ammoniac. But its vapour density corresponds not to the for NH_4Cl and the molecular weight 53·5, but to the this. Now this formula does not admit of dissoc nd the explanation at once suggests itself that pour examined was not really the vapour of sal iac, but of hydrochloric acid and ammoniac gas

potheti- of the decomposition of sal-ammoniac would of course completely explain the apparent y, each molecule NH_4Cl dividing into two mole NH_3 and HCl, the gas from a given weight of sal would of course contain twice as many molecules occupy twice the space which it would do if no such position had occurred. On this supposition the would remain uncombined as long as the ature was above the decomposing point of sal- and when the temperature fell below this point they would unite and reproduce sal-ammoniac. It was sary, however, to prove that this decomposition occu

As has been shown above (p. 618), the rate of dif of a gas depends upon its density. In this case th gases into which the substance may be supposed to up at the moment of volatilization differ considera density; we ought, therefore, to be able to effect p separation by means of diffusion, and it has been that such partial separation actually does occur. if we have hydrogen gas on one side of a porou phragm and volatilized sal-ammoniac on the other we find after a time that, mixed with the hydrog the one side, we have what we may for shortness ca ammoniac vapour that is, a vapour which when forms solid sal-ammoniac with an excess of amm which, being less dense than hydrochloric acid ga diffused faster, while on the other side, also mixed hydrogen which has diffused through the diaphrag have sal-ammoniac vapour with excess of hydrochlori the denser and more slowly diffusing gas. This of proves that the decomposition has occurred, but i not prove that the vapour of sal-ammoniac consists e of hydrochloric acid and ammonia *mixed* with one an That this in fact is not the case has been shown numerous experiment. The two gases were sepa rated to a temperature higher than that at which s moniac volatilizes, and were then allowed to mix in a kept at the same temperature as the two gases. I vessel a delicate thermometer was placed, and it was that the mixing of the two gases was accompanied small but very decided evolution of heat. This that some chemical combination takes place, and th mixed gases must contain some vapour of NH_4Cl. over, careful determinations of the vapour density ammoniac prove that it is a little more than the of the densities of ammonia and hydrochloric ac compared with air at the same temperature and ure, 1·01 instead of 0·925 at 350° C.); and this in of density on mixing the hot gases is easily explain supposing that a small proportion is in the condit NH_4Cl, while the most of the gas consists of se NH and HCl molecules.

In a similar way it has been shown that the vap oil of vitriol is a mixture of two vapours, that of H_2O, and that of sulphuric anhydride, SO_3; and sulphide of ammonium when volatilized breaks up two volumes of ammonia and one of sulphuretted drogen, $(NH_4)_2S = 2NH_3 + H_2S$. We find, therefore in the former case, as in that of sal-ammoniac, $v = \frac{3}{2}v$, and in the latter, $v = 3v$.

The peculiar kind of decomposition is now known by th "dissociation" (Second Year, pp. 175, 176.) In the cases w mentioned the substances undergo nearly complete dissocia the temperature at which they volatilize, and recombinatio place when they are cooled and again assume the solid, o the case of oil of vitriol, the liquid state. These substan therefore not suited for the illustration of the whole co dissociation. This has been carefully studied in the case o compounds in which the dissociation is far from complete, boiling point of the substance, with the result that, if AB compound dissociates into the separate molecules A and represent the amount of dissociation as the ratio of th ber of pairs of separate A and B molecules to the total nu pairs of A and B, both separate and combined. This ratio R is 0 when there is no dissociation, and 1 when dissociation is complete, $R = 1$.

(1) R increases as the temperature rises. (2) dR/dt (whe temperature) has a maximum when $R = \frac{1}{2}$. (3) The presence o either A or B diminishes the value of R. For instance, nearly completely dissociated into PCl_3 and Cl_2 at 300° C.; large excess of PCl_3 is mixed with the vapour it is found to scarcely any Cl_2, so that dissociation is greatly diminished presence of excess of PCl_3. These experimental results are of explanation on the kinetic theory of gas, if we adopt Pfau hypothesis. This is, that for each case of dissociation the

[1] Perhaps it is worth while to note that the molecular weight of sulphur in the form of vapour was first determined by Gay-Lussac and Thénard by taking the density of the vapour relative to that of air, and multiplying the ratio of the densities by 28·88, the molecular weight of air, as determined by Dumas. Their result was 96·3, which is very near the truth.

value for the internal kinetic energy[1] of a molecule of *AB*. ecule of *AB*, by encounters with other molecules or with of the vessel containing the gas, acquires a greater amount al kinetic energy than this limit, it at once breaks up into , so that in the ...cous mixture there are no molecules of ng more internal kinetic energy than the limit. Further, olecules, one of *A* and one of *B*, meet one another with elocity and with such an amount of internal kinetic energy ether the internal kinetic energy is less than the limit, they te to form a molecule of *AB*. Thus the molecules with ternal kinetic energy will be separate molecules of *A* and with small internal kinetic energy will mostly be united as his hypothesis has been to a considerable extent worked out lied by Pfaundler and by Naumann and the deduction gree fairly well with the results of experiment, but in some e theory has not been fully developed, and in one at do altogether to accord with observed fact. Some of the s have been mentioned above. We know enough of the f dissociation to see that it belongs to the class of *reversed actions*, in which a chemical change is reversible, and equili kept up, with constant external conditions, by the two chemical changes taking place to an equal extent in a given We can see that all such cases are explicable by the statistical but we cannot apply this method mathematically until we ore of the intimate nature of the molecule—not of the w they act upon one another. In the direction of the ... have looked specially at the case in which *A*, *B* and *AB* gaseous, because it was the question of molecular vapour s which led us to treat of the subject. Dr Crafts also shows one or two of the substances are dissolved or liquid ow see with what restrictions the method of vapour density able to the determination of molecular weight, and we can and more fully the example given in the text-book, p. 469. It is there shown that acetic acid vapour does not to the laws of Boyle and Charles until the temperature is about 250°, at the ordinary barometric pressure. At and at temperatures the vapour density corresponds to the formula $C_2H_4O_2$.

At lower temperatures the density corresponds to a higher ar weight. Now Playfair and Wanklyn determined the density at much lower temperatures than the ordinary boil- t of acetic acid, by greatly diminishing the pressure of the acetic acid vapour. This they accomplished by mixing it w large quantity of hydrogen, so that the pressure due to acetic vapour formed only a small fraction of the total pressure. vapour density of acetic acid at the low temperatures at which worked was found to correspond very nearly with the fo $C_4H_8O_4$, and, by comparing this result with what has been (p. 620) of the chemical evidence as to the molecular weight of acid, we may reasonably conclude that the molecule of aceti at low temperatures is $C_4H_8O_4$, and that as the temperature is it undergoes dissociation each molecule dividing into t $C_2H_4O_2$. This is then a case where *A* and *B* are equal, and divide into *A* + *A*. Another instance of the same kind is pro to be found in peroxide of ... OLFETTA, a city and seaport of Italy, in the province ari, 16 miles by rail north north west of Bari. From ea it presents a fine appearance with its white stone s and the remains of its turreted walls; and there are al buildings of considerable pretensions. The castle m the 11th century the prison of Otho, duke of wick. The cathedral is dedicated to St Conrad. ttracts well frequented markets, a small foreign trade 0 tons in 1881), and such industries as cotton and net ry, soap boiling, and rope spinning. The population 26,016 in 1871.

letta (Melficta or Matfetum) was given by Charles V. to the of Termoli in 1529, and during his brief spell was overrun by by the French under Lautrec. In 1531 Cesare Gonzaga took le of duke of Guastalla and prince of Molfetta; but in 1540 was sold to the Spanish family, and in 1798 incorporated with yal domain. The Hospitaller bishopric, directly of the papal see.

OLIÈRE (1622–1673), to give Jean Baptiste Poquelin age name which he chose, for some undiscovered reason, ame, was born in Paris, probably in January 1622. baptismal certificate which is usually, and almost with ute certainty, accepted as his is dated 15th January but it is not possible to infer that he was born on ay of his christening. The exact place of his birth s disputed, but it seems tolerably certain that he saw ght in a house of the Rue St Honoré. His father ean Poquelin, an upholsterer, who, in 1631, succeeded vn uncle as "valet tapissier de chambre du roi." The y of Poquelin came from Beauvais, where for some ries they had been prosperous tradesmen. The d of their Scotch descent seems to have been finally oved by the researches of M. E. Reverend du Mesnil. mother of Molière was Marie Cressé; and on his r's side he was connected with the family of Mazuel, rians attached to the court of France. In 1632 ere lost his mother; his father married again in 1633. ather possessed certain shops in the covered Halle de ire, Saint Germain des Près, and the biographers have ned that Molière might have received his first bent ds the stage from the spectacles offered to the holy people at the fair. Of his early education little is n, but it is certain that his mother possessed a Bible Plutarch's *Lives*, books which an intelligent child l not fail to study. In spite of a persistent tradition, is no reason to believe that the later education of re was neglected. "Il fit ses humanitez au College rmont," says the brief life of the comedian published s friend and fellow-actor, La Grange, in the edition s works printed in 1682. La Grange adds that e "eut l'advantage de suivre M. le Prince de Conti toute ses classes." As Conti was seven years ger than Molière, it is not easy to understand how e came to be the school contemporary of the prince. re modern critics studies the Jesuit fathers encouraged pupils to take part in *ballets*, and in later life ere was a distinguished master of this sort of entertainment. According to Grimarest, the first writer who ished a life of Molière in any detail (1705), he not acquired "les humanités, but finished his "philosophie" in five years. He left the College de Clermont in , the year when Gassendi, a great contemner of Aristotle, arrived in Paris. The *Logic* and *Ethics* of Aristotle, his *Physics* and *Metaphysics*, were the chief philosophical text books at the College de Clermont. But when came the pupil of Gassendi (in company with Cyrano ergerac, Chapelle, and Hesnault), Molière was taught preciate the atomic philosophy as taught by Lucretius. seems no doubt that Molière began—and almost or quite finished, a translation of the *De Natura* According to a manuscript note of Trallage, publis M. Paul Lacroix, the manuscript was sold by M widow to a bookseller. His philosophic studies left mark on the genius of Molière. In the *Jugement de sur les deux Parties des Nouveaux Dialogues des* (1684), the verdict is "que Molière ne parleroit p Philosophie." To "talk philosophy" was a favouri cise of his during his life, and his ideas are indicat sufficient clearness in several of his plays. There no connexion between them and the opinions of " le Critique" in a dialogue of that name, published land in 1709. From his study of philosophy, gained his knowledge of the ways of contemporary p of Pancrace the Aristotelian, of Marphorius the stoic, of Tris-otum, "qui s'attache pour l'ordre au tetrachorde", of Philaminte, who loves Platonism, of who relishes "les petits corps," and Armande, wh "les tourbillons." Grimarest has an amusing a of a controversy in which Molière, defending De chose a lay-brother of a begging order for umpire Chapelle appealed to the same expert in favour of Ga His college education over, Molière studied law, an is even evidence—that of tradition in Grimare of Le Boulanger de Chalussay, the libellous auth play called *Elomire Hypochondre*—to prove that actually called to the bar. More trustworthy is th ing remark in La Grange's short biography (168 *entre des écoles de droit*, il choisit la profession d dien." Before joining a troop of half-amateur com however, Molière had some experience in his father ness. In 1637 his father had obtained for him th to succeed to his own office as "valet tapissier de c du roi." The document is mentioned in the inven Molière's effects, taken after his death. When th travelled the valet tapissier accompanied him to the furniture of the royal quarters. There is ve reason to believe (Loiseleur, *Points Obscurs*, p. 9 Molière accompanied Louis XIII. as his valet tap Provence in 1642. It is even not impossible that was the young valet de chambre who concealed Cin just before his arrest at Narbonne, 13th June 164 this is part of the romance rather than of the his Molière. Our next glimpse of the comedian we document of 6th January 1643. Molière ackno the receipt of money due to him from his deceased m estate, and gives up his claim to succeed his father as de chambre du roi." On 28th December of the sa we learn, again from documentary evidence, tha Baptiste Poquelin, with Joseph Béjard, Madeleine Geneviève Béjard, and others, have hired a tenni and fitted it up as a stage for dramatic performance company called themselves L'Illustre Théâtre, *illust* then almost a slang word, very freely employed writers of the period.

We now reach a very important point in the history of Molière, which it is necessary to discuss length in defence of the much maligned charact great writer and a good man. Molière's connecti the family of Béjard brought him much unha The father of this family, Joseph Béjard the elde new tapissier, a man with eleven children at least. His wife was Marie Hervé. The most noted of his childre panions of Molière, were Joseph, Madeleine, Geneviè Armande. Of these, Madeleine was a woman o talent as an actress, and Molière's friend, or perha trees, through all the years of his wanderings. N 14th February 1662 (for we must here leave the logical order of events), Molière married Armand Élisabeth Grésinde Béjard. His enemies at tha

number of his biographers in our own day, have ted to prove that Armande Béjard was not the sister, e daughter of Madeleine, and even that Molière's ay have been his own daughter by Madeleine The arguments of M. Arsène Houssaye in sup this abominable theory are based on reckless and t confusions, and do not deserve criticism. But tem of M. Loiseleur is more serious, and he goes her than the idea that Madeleine was the mother ande. This, certainly, was the opinion of tradition, ion based on the slanders of Montfleury, a rival of e's, on the authority of the spiteful and anonymous of *La Fameuse Comédienne* (1688), and on the libellous play, *Elomire Hypochondre*. In 1821 on received a shock, for Beffara then discovered e's "acte de mariage," in which Armande, the bride, en of as the sister of Madeleine Bejard, by the same and mother. The old scandal, or part of it, was by M. Fournier and M. Bazin, but received another 1863. M. Soulié then discovered a legal document March 1613, in which the widow of Joseph Bejard ced, in the name of herself and her children, his ance, chiefly a collection of unpaid bills. Now in cument all the children are described as minors, and them is "*une petite non encore baptisée*." The little ill not christened in March 1643, is universally ized as the Armande Béjard afterward married by e. We reach this point, then, that when Armande infant she was acknowledged as the sister, not a the er, of Madeleine Bejard. M. Loiseleur refuses, how o accept this evidence. Madeleine, say he, had become the mother, in 1638, of a daughter by Raymond de Moirmoron, comte de Modene, and erlain of Gaston duc d'Orleans, brother of Lou In 1642 Modene, who had been exiled for political s, "was certain to return, for Richelieu had just nd Louis XIII. was likely to follow him." Now ine was again this is M. Loiseleur's hypothesis to become a mother, and if Modene returned, and this fact, he would not continue the *liaison*, still uld he marry her,—which, by the way, he could not his wife was still alive. Madeleine, therefore, d her mother to acknowledge the little girl as her ild. In the first place, all this is pure unsupported esis. In the second place, it has always been denied ejard's wife could have been a mother in 1643, owing advanced age, probably fifty three. But M. Loise imself says that Marie Hervé was young enough to he story "sufficiently probable." If it was probable, more was it possible. M. Loiseleur supports his tion by pointing out that two of the other children, ed as legally minors, were over twenty five, and that ge was understated to make the account of Armande more probable. Nothing is less likely than that e would have consulted this document to ascertain uth about the parentage of Armande, yet M. Loise whole theory rests on that extreme improbability st also be observed that the date of the birth of Béjard is unknown, and he *may* have been, and ing to M. Jal (*Dictionnaire Critique*, p. 178) *must* een, a minor when he was so described in the deed f 10th March 1643, while Madeleine had only passed enty-fifth birthday, her legal majority, by two months iew of Joseph's age is supported by Bonnet (*Molière en*, p. 77). M. Loiseleur's only other proof is that Hervé gave Armande a respectable dowry, and that, do not know whence the money came, it must have from Madeleine. The tradition in Grimarest, which Madeleine behave *en femme furieuse*, when she heard marriage, is based on a juster appreciation of the character of women. It will be admitted, probably the reasons for supposing that Molière espoused the da of a woman who had been his mistress (if she had be mistress) are flimsy and inadequate. The affair dowry is insisted on by M. Livet (*La Fameuse Comé* reprint of 1877, p. 113). But M. Livet explains the by the hypothesis that Armande was the daugh Madeleine and the comte de Modene, which exacti tradicts the theory of M. Loiseleur, and is itself dicted by date at least as understood by M. Loi Such are the conjectures by which the foul calumn Molière's enemies supported the lays of m French critic

To return to the order of events, Molière pass year 1643 playi with, and helping to manag Théâtre Illu The company acted in various courts, with very little co- Molière was ar arrested by the trade man who supplied candles, an company had to borrow money from one Aubrey to their leader from the Grand Châtelet (15th August The process of turning a tennis court into a theat somewhat expensive, even though no seats were pr in the pit The troupe was for a short time under protection he duc d'Orléans, but his favours we lucrative. The duc de Guise, according to some printed in 1646, made Molière a present of his wardrobe But costume was not enough to dra public to the tennis court theatre of the Croix and empty houses at last obliged the Théâtre Illu leave Paris at the end of 1646

"Nul animal n'osait rentrer dans notre salle," s author of the contemporary play on Molière, *Élomire chondre*. But at that time one of the travelling com found means to exist in the provinces, and Molière summoned to play among the rural towns. The care strolling players is all sorts and conditions of mankind. The *Roman* scarcely gives a picture of the adventu nature, the di of transport, the queer cavalcade of horses, mule lumbering carts that drew the wardrobe and prop the sudden metamorph the to ours, who half-have just been rattling, into a large, the square local square, the disturbed nights in overcrowded country all the love and war of art in the march P tells us what the arrangeme at the theatre w Molière's early time. Ta were little com and costume re made by stro

nough the heavy curtain often knocked o hat of the comedian or even a dance took to the of a warrior or a god. Th ghts were candles st tin sconces at the back an de, but luxury soon went so far that a chandelier of ten candles was su from the roof. As interested the candles were let do a rope and pulley, and any one within easy reach them with his finger. A fi e and fanfaron, fiddlers, supplied the music. The highest prices w for seats in the *Salle* (central admission fivepence the privilege of standing on the pit was twopence hal was the charge. The doors were opened at one the curtain rose at four.

The normal division of the Théâtre Illustre provinces was Du Parc, the most noted actor Molière, the Béjards and Du Parc, called Gro Ré extremely difficult to follow exactly the fortunes the company. They played at Pézenas, for some the date of this performance, when Molière presente Montesquieu) failed in tragedy and was pelted, is va given as 1644-45 (Taillaige), 1647 (Desfeuilles), 1 (Lacroix). Perhaps the theatre prospered bette where than in Paris, where the streets were barrica

early days of the war of the Fronde. We find
re at Nantes in 1648, at Fontenay-le-Compte, and
spring of 1649 at Agen, Toulouse, and probably at
ulême and Limoges. In January 1650 they played
rbonne, and between 1650 and 1653 Lyons was the
quarters of the troupe. In January 1653, or perhaps
Molière gave *L'Étourdi* at Lyons, the first of
ed p contrasted with the slight farces with
he generally diverted a country audience. It would
too long to have the precise date of this piece, but
range (1682) says that "in 1653 Molière went to
, where he gave his first comedy, L'Etourdi," while
Registre La Grange enters the year as 1655. At
De Brie and his wife, the famous Mlle. de Brie,
d the troupe, and Du Parc married marquis de Gorla,
known as Mlle. du Parc. The libellous author of
Vie de Corneille reports that Molière's heart was
nt the cock of the heartiful Du Parc and De Brie, and
addition has a persistent life. Molière's own opinion
s ladies and men of his company may be read be
the lines of his *Impromptu de Versailles*. In 1653
de Conti, after many political adventures, was
g at La Grange, near Pézenas, in Languedoc, and
brought him into relations with his old school
Molière. Conti had for first gentleman of his bed
ber the abbé Daniel de Cosnac, whose memoirs now
light for a moment on the fortunes of the wander
troupe. Cosnac engaged the company "of Molière and
Béjart," but another company, that of Cormier, nearly
epted the favour of the prince. Thanks to the resolu
f Cosnac, Molière was given one chance of appearing
private theatre of La Grange. The excellence of
ting the splendour of the time, and the mutual
t Cosnac and of Sarrazin, Conti's secretary, gained
ay for Molière, and a pension was assigned to his
ny (Cosnac, *Mémoires*, t. I^er, Paris, 1852). We
e proposed to pay Molière a thousand crowns of his
money to recompense the honours he had supplanted
ntrast, it is obvious that his profession had become
ently lucrative. In 1654 during the session of the
s of Languedoc Molière and his company played at
ollier. Here Molière danced in a ballet (*Le Ballet
comparaisons*) in which a number of men of rank took
ccording to the fashion of the time. Molière's own
were those of the Poet and the Pedant. The poet
little piece is to introduce opposite characters
e and arguing together. Silence dances with six
n. Truth with four courtiers, Money with a poet
fourth. Whether the ballet, or any part of it, is
here, is still disputed (*La Jeunesse de Molière, avec
Ballets, Documents &c.*, P. L. Jacob, Paris, 1858). In
however it is certain that the troupe was at Lyons,
they met and hospitably entertained a prelate
Cruche d'Alby, who informs the town that
" Molière at Pézenas, w
were convened, and where local
barber's chair in which the poet
hastened. The long list of Molière's
t autograph receipt, dated at Pézenas, 4th Feb
1656, for 6000 livres, granted by the estates of
guedoc. This sum was not divided for the earliest repre
tion, at Pézenas or Montpellier, of Molière's second finished comedy,
Dépit Amoureux. Conti now withdrew to Paris, and
to "make his court the fourth way. Almost his
t of penitence was to dissolve Molière's troupe (1657),
consequently found that the liberality of the estates
ruptly dried over. Conti's relations
Molière must have definitively closed long before 1666,
the now pious prince wrote a treatise against the
stage, and especially charged his old schoolfellow with keeping a new school, a school of atheism (*Traité de la Comédie*, p. 21, Paris, 1666). Molière was now (1657) independent of princes and their favour. He went on a new circuit to Nismes, Orange, and Avignon, where he met another old class-mate, Chapelle, and also encountered the friend of his later life, the painter Mignard. After a later stay at Lyons, ending with a piece given for the benefit of the poor on 27th February 1658, Molière passed to Grenoble, returned to Lyons, and is next found in Rouen, where, we should have said, the Théâtre Illustre had played in 1613 (F. Bouquet, *La Troupe de Molière à Rouen*, p. 90, Paris, 1880). At Rouen Molière must have made or renewed the acquaintance of Pierre and Thomas Corneille. His company had played pieces by Corneille at Lyons and elsewhere. The real business of the comedian in Rouen was to prepare his return to Paris. "After several secret journeys thither he was fortunate enough to secure the patronage of Monsieur, the king's only brother, who granted him his protection, and permitted the company to take his name, presenting them as his servants to the king and the queen-mother" (Preface to La Grange's edition of 1682). The troupe appeared for the first time before Louis XIV. in a theatre arranged in the old Louvre (24th October 1658).

Molière was now thirty-six years of age. He had gained all the experience that fifteen years of practice could give. He had seen men and cities, and noted all the humours of rural and civic France. He was at the head of a company which, as La Grange, his friend and comrade, says, "sincerely loved him. He had the unlucrative patronage of a great prince to back him, and the jealousy of all playwrights, and of the old theatres of the Hôtel de Bourgogne and the Marais, to contend against. In this struggle we can follow him by and of the *Registre* of La Grange (a brief diary of receipts and payments), and by the help of notices in the rhymed chronicles of Loret.

The first appearance of Molière before the king was all but a failure. *Nicomède*, by the elder Corneille, was the piece, and we may believe that the actors of the Hôtel de Bourgogne, who were present, found much to criticize. When the play was over, Molière came forward and asked the king's permission to act "one of the little pieces with which he had been used to regale the provinces." The *Docteur Amoureux*, one of several slight comedies admitting of much "gag," was then performed, and "diverted as much as it surprised the audience." The king commanded that the troupe should establish itself in Paris (Preface, ed. 1682). The theatre assigned to the company was a *salle* in the Petit Bourbon, in a line with the present Rue du Louvre. Some Italian players already occupied the house on Tuesdays, Fridays, and Sundays; the company of Molière played on the other days. The first piece played in the new house (3d Nov. 1658) was *L'Étourdi*. La Grange says the comedy had a great success, producing twenty pistoles for each actor. The success is admitted even by the paternal author of *Élomire Hypochondre* (Paris, 1670)

"Le jour l'Etourdi, qui fut une merveille."

The success, however, is attributed to the farcical element in the play and the acting—the cuckoo cry of Molière's detractors. The original of *L'Étourdi* is the Italian comedy (1629) *L'Inavvertito*, by Nicolò Barbieri detto Beltrame's. Molière pushed rather far his right to "take his own where'er he found it." Had he written nothing more original, the contemporary critic of the *Festin de Pierre* might have said, not untruly, that he only excelled in stealing pieces from the Italians. The piece is conventional: the stock characters of the prodigal son, the impudent valet, the old father occupy the stage. But the dialogue

azing rapidity, and the vivacity of M. Coquelin in
lle still makes *L'Étourdi* a favourite on the stage,
it cannot be read with very much pleasure. The
ece, new in Paris, though not in the provinces, was
pit Amoureux (first acted at Béziers, 1656). The
s not less successful than *L'Étourdi*. It has two

ne praise was given, perhaps even more deservedly, to
ieuses Ridicules (18th November 1659). Doubts have
ised as to whether this famous piece, the first true
atire of contemporary foibles on the French stage,
ew play. La Grange calls it *pièce nouvelle* in his
, but, as he enters it as the third *pièce nouvelle*,
y only mean that, like *L'Étourdi*, it was new to
The short life of 1682, produced under L. Guérin's
d probably written by Marcel the actor-say the
es was "made" in 1659. There is another contro
s to whether the ladies of the Hôtel Rambouillet,
ly their *bourgeoises* and ridiculous mutual worshipped
nage, in later years at least, professed to recognize an
on the over-refinement and affectation of the original
most ways, honourable *précieuses* of the Hôtel Ram
. But, Chapelle and Bachaumont had discovered
ial *précieuses*, hyper-aesthetic literary ladies, at Mont-
before Molière's return to Paris; and Tristan,
Roman Bourgeois (1666), found Paris full of middle
précieuses, who had survived, or, like their modern
parts, had thriven on ridicule. Another
l Molière copy from the earlier *Précieuses* of the
e Pure? This charge of plagiarism was brought by
e, in the preface to his *Véritables Précieuses*. De
work was a novel (1656), from which the Italian
had put together an acting piece in their manner,
a thing of "gag," and improvized speeches. The
h is interesting only because it proves how early
found enemies who, like Thomas Corneille in 1659,
l him of being skilled only in farce, or, like Somaize,
l him with literary larceny. These were the stock
ns of Molière's opponents as long as he lived. The
of the *Précieuses Ridicules* was immense, on one
occasion the king was a spectator, leaning against
eat chair of the dying Cardinal Mazarin. The play
ver cease to please while literary affectation exists,
has a comic force of deathless energy. Yet a man
may spare some sympathy for the poor heroine,
o not wish, in courtship, to "begin with matrimony,"
efer first to have some less formidable acquaintance
eir wooers. Molière's next piece was less important,
ore purely farcical, *Sganarelle; ou le Cocu Imaginaire* (8th May 1660). The public taste preferred a work
light nature, and *Sganarelle* was played every year
as Molière lived. The play was pirated by a man
etended to have retained all the words in his memory.
ounterfeit copy was published by Ribou, a double
to Molière, as, once printed, any company might act
y. With his habitual good-nature, Molière not only
l Ribou to publish later works of his, but actually
oney to that knave (Soulié, *Recherches*, p. 287).
11th October 1660 the Théâtre du Petit Bourbon
emolished by the superintendent of works, without notice given to the company. The king gave Molière
Salle du Palais Royal, but the machinery of the old th
was maliciously destroyed. Meanwhile the older comp
of the Marais and the Hôtel de Bourgogne attempt
lure away Molière's troupe, but, as La Grange de
(*Registre*, p. 26), "all the actors loved their chief
united to extraordinary gentus an honourable cha
and charming manner, which compelled them all to p
that they would never leave him, but always share h
tune..." While the new theatre was being put in
the company played in the houses of the great and
at the Louvre. In (orig
built by Richelieu) Molière began to play on 20th Ja
1661. Molière now gratified his rival by a failure.
Dépit de Amoureux, a heavy tragi-comedy, which had
lain among his papers, was first represented on 11th Feb
1661. Either Molière was a poor actor out of his co
or his manner was not sufficiently "tragic," and, a
say, "démodée," for the taste of the day. He appe
were determined that he could not act in tragi-comedy
he, in turn, burlesqued their pretention and exagge
manner in a later piece. In the *Précieuses* he
lished already rallied "les grands comédiens" of the
Bourgogne. "Les autres," he makes Magdelon say
his own troupe, "sont de grands acteurs qui récitent c
l'on parle, et ne savent pas faire rouler le vers." A
was likely to imitate the *grands comédiens*, and their tr
who avenged themselves on that unfortunate jeune p
Don Garcie de Navarre. The object of the new
drama is one of many examples which bear how Mo
mind was enraged with the serious or romantic pe
jealousy, a passion which he had soon cause to know
intimately. Meantime the everyday life of the thea
on, and the doorkeeper of the Théâtre St Germain
wounded by some revellers who tried to force their
into the house (La Grange, *Registre*). A year lat
Italian actor was stabbed in front of Molière's house,
and sought to take shelter (Campardon, *Nouv*

Pellisson, a friend of Fouquet's, was arrested [illegible]
the superintendent of finance. Pellisson's prologu

were retained in later editions. In the dedication king Molière says that Louis suggested one scene f the Sportsman), and in another place he mentions he piece was written, rehearsed, and played in a ht. The fundamental idea of the play, the inter- s by hores, is suggested by a satire of Régnier's, at by a satire of Horace. Perhaps it may have been knowledged s ns of the king which mac declare that Molière habitually worked up hints ames given him by persons of quality (*Nouvelles* s, 1663).

February 1662 Molière married Armande Béjard. ate is given thus in the *Registre* of La Grange, y 14, Les Vi-onnaires, L'Ecol de M

Part Visite chez M d'Equeuilly"

the marem he ha painted a blue circle, his way of n a happy event, with the words, "mariage de M. ière au sortir de la Visite." M Lorsclem give the one pr ace as 29th February, in another a 20th ry. But La Grange elsewhere mentions the date rove Tuesday, which was it seems, 14th February. ere M Lor-clem make the date of the marriage a lay "in January." The truth is that the marriage t i dated 23d January 1662 (Soulie, *Documents*, p Where it s so difficult to establish the date of the ge, a simple fact, it must be infinitely harder to dis- he truth as to the conduct of Madame Molière. The nable a-sertions of the anonymous libel, *Les Intrigues ère et celles de sa Femme ou la Fameuse Comédienne*, have found their way into tradition, and are accepted But M. Lavet and M Bazin have that the alleged lover of Madame Molière y absent from France, or from the court, at the hen they are reported, in the libel, to have conquered rt. between Chapelle and Molière, h the comedian is made to tell the story of his , is plainly a mere fiction, and is answered in est by another dialogue between Molière and Rohault, ch Molière only complains of a jealousy which he to be unfounded It is noticed too, that the con ary assailant of Molière counted him among jealous among deceived, husbands. The Incest-accusation t by the actor Montfleury that Molière had married daughter, Louis XIV answered by becoming the er of Molière's child. The king, indeed, was a end of the actor, and, when Molière was accused of on the production of *Don Juan* (1665), Louis gave ion. We need not try to make Madame Molière a French ladies of the theatre say, but the actions e charges against her are unsubstantiated. It is ly thought that Molière drew her portrait in *Les Contes d'Eliomire*, acte iii sc ix., "elle est capri- ieuse comme toute les Belles."

n 1663 onwards Molière suffered the increasing of his royal actors. La Grange mentions the visit rlon and Montfleury to the queen mother, and troupe to obtain equal favour, "la troupe de Molière ordinaire beaucoup de jalousie" (12th August 1662). th Dépit amoureux was played for the first time the ble *L'Ecole des Femmes*, which provoked a literary d caused a shower of "paper bullets of the brain." nocence of Agnès was called indecency, the sermon olphe was a deliberate attack on Christian mystères. ve not the place to discuss the religious ideas of ; but both in *L'Ecole des Femmes* and in *Don Juan* s display a bold contempt for the creed of "boiling es" and of a physical hell. A brief list of the nd pamphlet provoked by *L'Ecole des Femmes* is all offer in this place.

ber 26, 1662 *École des Femmes.*

February 9, 1663.—*Nouvelles Nouvelles*, by De Visé. Molière accused of pilfering from Straparola.

June 1, 1663. Molière's own piece, *Critique de l'École Femmes*. In this play Molière retorts on the critics, and espec on his favourite butt, the critical marquise.

August 1663. *Zélinde*, a play by De Visé, is printed. The is in the shop of a seller of lace, where persons of quality meet attack the reputation of "Elomire," that is, Molière. He from the Italian, the Spanish, from Furetière's *Francion*, "il lit les vieux bouquins," he insults the *noblesse*, he insults Christia and so forth.

November 17, 1663.—*Portrait du Peintre* is printed,—an a on Molière by Boursault This piece is a detailed criticism cental personages of *L'Ecole des Femmes*. It is pronounced vulgar, farcical, obscene, and (what chiefly vexed Molière, who the danger of the accusation) impious. Perhaps the only biog real matter we gain from Boursault's play is the interesting that Molière was a front-player. On 4th November 1663 M replied with *L'Impromptu de Versailles*, a witty and mer attack on his critics, in which Boursault was mentioned by n The actors of the Hôtel de Bourgogne were parodied on the s and their art was ridiculed.

The next scenes in this comedy of comedians were:—

November 30 The *Panégyrique de l'Ecole des Femmes*, by Rol

December 7. *La Vengeance de l'Impromptu; ou la Vengeance des quets*, by De Vis

January 19, 1664. *L'Impromptu de l'Hôtel de Condé*. It reply by a friend of Montfleury

March 14, 1664. *La Guerre Comique; ou Défense de l'Éco Femmes*.

1664. *Lettre sur les Nouveaux Théâtre*, published in *Dive Galerie* by the author of *Zélinde*.

In all these quarrels the influence of Corneille opposed to Molière, while his cause was espoused Boileau, a fruitful ally, when "les comédiens et les aut depuis le cadet [Corneille ?] jusqu'à Thysope, sont di ment armés contre lui" (*Impromptu de Versailles*, scène

Molière's next piece was *Le Mariage Forcé* (15th ruary 1664), a farce with a ballet. The comic chara of the reluctant bridegroom excites contemptuous as well as laughter. From the end of April till 22d the troupe was at Versailles, acting among the picture plea-ures of that great festival of the king's. The *Prin d'Elide* was acted for the first time, and the three acts of *Tartuffe* were given Molière's natural hatre hypocrisy had not been diminished by the charges of phemy which were showered on him after the *Ecole Femmes*. *Tartuffe* made enemies everywhere. Janse and Jesuits, like the two marquises in *L'Impromptu Versailles*, each thought the others were aimed at. years passed before Molière got permission to pla whole piece in public. In the interval it was acted b Madame, Condé, the legate, and was frequently rea Molière in private houses. The *Gazette* of 17th May (a paper hostile to Molière) says that the king thought piece inimical to religion. Louis was not at that on good terms with the *dévots*, whom his amours scan ized but, not impossibly, the queen mother (then suffe from her fatal malady) disliked the play. A most vi attack on Molière, "that demon clad in human flesh written by one Pierre Roullé (*Le Roy Glorieux au M* Paris, 1664). This fierce pamphlet was suppressed, the king's own copy, in red morocco with the royal a remains to testify to the bigotry of the author, who curé of Saint Barthélemy. According to Roullé, Mo deserved to be cast through earthly to eternal fires. play was prohibited, as we have seen, but in August the king adopted Molière's troupe as his servants, and them the title of "troupe du roy." This, however, did cause Molière to relax his efforts to obtain permissio *Tartuffe* (or *Tartufe*, or *Tartuffe*, as it was variously spel and his perseverance was at length successful. Tha thoughts were busy with contemporary hypocrisy is pr by certain scenes in one of his greatest pieces, the *F de Pierre*, or *Don Juan* (15th February 1665). The le of *Don Juan* was familiar already on the Spanish, Ita

nch stages. Molière made it a new thing: terrible
antic in its portrait of *un grand seigneur méchant*
modern in its suggested substitution of *la humanité*
gion, comic, even among his comedies, by the mirth-
acter of Sganarelle. The piece filled the theatre,
stopped, probably by authority, after Easter. It
printed by Molière, and even in 1682 the publi
of the full text was not permitted. Happily the
De la Regnie, the chief of the police, escaped
tions, and gave us the full scene of Don Juan and
ggar. The piece provoked a virulent criticism
tions sur le Festin de Pierre, 1665). It allowed
olière has some farcical talent, and is not an killed
giarist, but he "attacks the interests of Heaven,"
a school of infidelity," "insults the king," "con-
irtue," "offends the queen mother," and so forth
olies were published, one of which is by some critics
d to show traces of the hand of Molière. The king
s has been shown, was to adopt Molière's company
servants, and to pension them. *L'Amour Médecin*,
comedy, appeared 22d September 1665. In th
Molière, for the second time, attacked physicians.
ember there was a quarrel with Racine about his
Alexandre, which he treacherously transferred to the
le Bourgogne. June 4, 1666, saw the first repre
n of that famous play, *Le Misanthrope* (or *L'Atra
Amoureux*, as the original second title ran). This,
erhaps the masterpiece of Molière, was n
with the critics, with the court, and with posterity
ith the public. The rival comedians called it "a
le of comedy," and so it was. The eternal passions
timents of human nature, modified by the refinement
utmost refinement of civilization, were the matter of
e. The school for scandal kept by Célimène, with

dignatio of a noble nature soured (Alceste) supe
e intellectual action. The humours of the joyous ly
Célimène and of her court, especially of that death-
or poet Oronte, supply the lighter comedy. Boileau,
, Goethe have combined to give this piece the
rank even among the comedies of Molière. As to
eys" to the characters, and the guesses about the
l from whom Alceste was drawn, they are as value
other contemporary tattle.

iefer summary must be given of the remaining years
ife of Molière. The attractions of *Le Misanthrope*
einforced (6th August) by those of the *Médecin
Lui*, an amusing farce founded on an old *fabliau*.
ember the court and the comedians went to Saint
n, where, among other diversions, the pieces called
te, *La Pastorale Comique* (of which Molière is said
e destroyed the MS.), and the charming little piece
lien, were performed. A cold and fatigue seem to
njured the health of Molière, and we now hear of
sumptive tendency which was cruelly ridiculed in
e Hypochondre. Molière was doubtless obliged to
much of the distracted or pedantic physicians of an
en medicine was the battlefield of tradition, super
and nascent chemical science. On 17th April
obinet, the rhyming gazetteer, says that the life of
e was thought to be in danger. On the 10th of
nowever, he played in *Le Sicilien* before the town.
earlier months of 1667 Louis XIV. was with the
n Flanders. There were embassies sent from the
to the camp, and on 5th August it was apparent
olière had overcome the royal scruples. *Tartuffe*
ayed, but Lamoignon stopped it after the first night.
nge and La Torillière hastened to the camp, and
got the king's promise that he would reconsider the matt
on his return. Molière's next piece (13th January 166
was *Amphitryon*, a free a very free adaptation fro
Plautus, who then seems to have engaged his attentio
for not long afterwards he again borrowed from the ancie
writer in *L'Avare*. There is a controversy as to wheth
Amphitryon was meant to ridicule M. de Montespan, t
husband of the new mistress of Louis XIV. Michelet h
a kind of romance based on the probably groundless hyp
theses. The king still saw the piece occasionally, after
had purged himself and for-worn sack under Madame
Maintenon, and probably neither he nor that devout lad
detected any personal references in the coarse and wit
comedy. Naturally, Molière was accused of plagiarizing, th
time from Rotrou, who had also imitated Plautus. Th
next play was the immortal *George Dandin* (10th July), fir
played at a festival at Versailles. Probably the piece w
a rapid palimpsest on the ground of one of his old farce
but the addition of these typical members of a coun
family, the De Sotenvilles, raises the work from farce
satiric comedy. The story is borrowed from Boccacci
but is of unknown age, and always new. Adolphus Ego
in *The Small Hours at Ulvaston* hence a kind of mode
George Dandin. Though the sad fortunes of the peas
with social ambition do not fail to make us pity him on
what, it is being too refined to regard *George Dandin*
a comedy with a concealed tragic intention. Molière
must have been at work on *L'Avare* before *George Dand*
appeared, for the new comedy after Plautus was first act
on 9th September. There is a tradition that the pie
almost failed; but, if unpopular in the first year of its p
duction, it certainly gained favour before the death of
author. *M. de Pourceaugnac* (17th September 1669) w
first acted at Chambord, for the amusement of the kin

There is no biography of Molière on a level with the latest researches into his life. The best is probably that of M. Taschereau, prefixed to an edition of his works (*Œuvres Complètes*, Paris, 1863). To this may be added Jules Loiseleur's *Les Points Obscurs de la Vie de Molière*, Paris, 1877. We have seen that M. Loiseleur is not always accurate, but he is laborious. For other books it is enough to recommend the excellent *Bibliographie Moliéresque* of M. Paul Lacroix (1875), which is an all but faultless guide. The best edition of Molière's works for the purposes of the student is that published in *Les Grands Écrivains de la France* (Hachette, Paris, 1873-1882). The edition is still incomplete. It contains reprints of many contemporary tracts, and, with the *Registre* of La Grange, and the *Bibliographie Moliéresque* of M. Lacroix, is the chief source of the facts stated in this notice, in cases where the rarity of documents has prevented the writer from studying them in the original text. Another valuable authority is the *Recherches sur Molière* (Paris, 1863) of Ed Soulié (1863). Lotheisen's *Molière, sein Leben und seine Werke* (Frankfurt, 1880), is a respectable German work. *Le Moliériste* (Tresse, Paris, edited by M. Georges [illegible]), a monthly journal, containing notes on Molière and his contributors. The essays, biographies, plays, [illegible] extremely numerous. The best guide to them is the *Bibliographie* of M. Lacroix. The English [illegible] as a rule absolutely untrustworthy. (A. L.)

MOLINA, Luis (1535–1600), a Spanish Jesuit, whom his *Provincial* have rendered immortal, was born at Cuenca in 1535. Having at the age of eighteen become a member of the Company of Jesus, he studied theology at Coimbra, and afterwards became professor in the university of Evora, Portugal. From this post he was called, at the end of twenty years, to the chair of theology in Madrid, where he died on 12th October 1600. Besides other works he wrote *Liberi arbitrii cum gratiæ donis, divina præscientia, providentia, prædestinatione et reprobatione, concordia* (4to, Lisbon, 1588); a commentary on the first part of the *Summa* of Thomas Aquinas (2 vols. fol., Cuenca, 1593); and a treatise *De Justitia et Jure* (6 vols., 1593–1609). It is to the first of these that his fame is principally due. It was an attempt to reconcile in words at least, the Augustinian doctrines of predestination and grace with the Semipelagianism which, as shown by the recent condemnation of BAJUS (*q.v.*), had become prevalent in the Roman Catholic Church. Assuming that man is free to perform or not to perform any act whatever, Molina maintains that this circumstance renders the grace of God neither unnecessary nor impossible:—not impossible, for God never fails to bestow grace upon those who ask it with sincerity; and not unnecessary, for grace, although not an efficient, is still a sufficient cause of salvation. Nor, in Molina's view, does his doctrine of free will exclude predestination. The omniscient God, by means of His "[illegible] media" (the phrase is Molina's invention, though the [illegible] also to be found in his older contemporary Fonseca), or power of knowing future contingent events shall employ our own free-will and treat Him preferred grace, and upon this foreknowledge He can found His predestinating decrees. These doctrines, although in harmony with the prevailing feeling of the Roman Catholic Church of the period, and further recommended by their marked opposition to the teachings of Luther and Calvin, excited violent controversy in some quarters, especially on the part of the Dominicans, and at last rendered it necessary for the pope (Clement VIII.) to interfere. At first (1594) he simply enjoined silence on both parties so far as Spain was concerned; but ultimately, in 1598, he appointed the "Congregatio de Auxiliis Gratiæ" for the settlement of the dispute, which became more and more a party one. After holding very numerous sessions the "congregation" was able to decide nothing, and in 1607 its meetings were suspended by Paul V., who announced his intention of himself pronouncing judgment in due time. He contented himself, however, in 1611

rohibiting all further discussion of the question "de
s," and studious efforts were made to control the
ation even of commentaries on Aquinas. The
st subsequently passed into the Jansenist controversy,
is as a champion of Jansenism that Pascal in th
cial Letters attacks Molina and the *scientia media*
ANSENISM).

LINE, a city of the United States, in Rock Island
, Illinois, is situated in a picturesque district on the
nk of the Mississippi, opposite the upper end of Rock
. First settled in 1832, the town was organized as
in 1872. It is noted for its water-power, developed
aintained by the Government, and for the number and
ance of it. manufacturing establishment. By means
am nearly a mile in length, from the main shore
island, an almost uniform head of 7 feet of water i
d, which is used in driving the machinery of the
nment arsenal on the island, and in supplying power
ral factories. Beds of bituminous coal are mined in
ghbourhood, and three lines of railway pass through
y, affording with the river ample means of communi
The most prominent manufactures are agricultural
ents and machinery generally, waggons, organs,
and stoves. Moline has nine churches, a complete
of graded free schools, including a high school, and
library. The population increased from 1066 in
o 7805 in 1880, and with the suburbs the number
estimated at 12,000.

LINOS, MIGUEL DE (1627 *c.* 1690), a Spanish
whose name is intimately associated with that type
gion known in Italy and Spain during the latter
the 17th century as Quietism, was born of poor
in the diocese of Saragossa, on 21st December 1627.
g entered the priesthood, he settled about his fortieth
a Rome, where he speedily rose to high reputation as a
confessor, and gained many distinguished friends,
whom were several cardinals, including Odescalchi
wards Innocent XI., 1676). In 1675 he published at
a small duodecimo volume entitled *Guida spirituale
involge l'anima e la conduce per l'interno cammino all
o della perfetta contemplazione e del ricco tesoro della
nteriore*, which was soon afterwards followed by the
trattato della cottidiana communione, usually bound
h it in later editions. The work, which breathes a
of simple and earnest piety, is designed to show how
peace may be found by what may be called con-
tive or passive prayer, by obedience, by frequent
nion, and by inward mortification; it was widely
ted, and greatly increased the popularity of its
, whom Innocent XI. after his elevation provided
ooms in the Vatican, and is said to have also taken
spiritual director. Its doctrine of the passivity of
ghest contemplation and purest prayer does not
to have raised the slightest dissension until after
olication, in 1681, of the *Concordia tra la fatica e
te nell' oratione*, by the Jesuit preacher, Paolo Segneri,
gh scrupulously refraining from any mention of
me of Molinos, and indeed displaying considerable
ation as a controversialist, Segneri by this tract and
other with which he followed it up brought upon
f much unpopularity; and so great did the excitement
e that a committee was at last appointed by the
ition to investigate his own views as well as to
ne the writings of Molinos and of his friend Petrucci
r of *La contemplazione mistica acquistata*). The
(1682) was entirely favourable to the doctrines of the
Spirituale, the writings of Segneri being censured
adalous and heretical; but in 1685, in consequence
resentations made to the pope by Louis XIV., under
suit influence of Père La Chaise, both Petrucci and
Molinos were laid under arrest, and the papers of the
including a voluminous correspondence, seized. P
was soon afterwards liberated, and relieved from
persecution by the gift of a cardinal's hat; but, after M
had languished in confinement for two years, sudden
persons, many of them of high rank, were also appre
by order of the Inquisition for what were then for t
time called "Quietist opinions." In 1687 the pope
fied his approval of the condemnation pronounced
Inquisition on sixty-eight doctrines imputed to M
The "heretic" forthwith "abjured" these, and thus
the flames indeed, but did not regain his liberty.

The Molise territory was in ancient times part of the co
the Sabine and Samnite. Under the Lombards it was
in the duchy of Benevento; but the district of Sepino,
and Terra were early all to form a dominion for the Lombard
come to be called King Grimoald. About two centuries later this
the county-ship of Boiano, and the name was soon after cha
count-ship of Molise, probably because the local dynasty lived
di Molise, or Molise. Attached under Frederick II to the
Lavoro, and at a later date incorporated with Capitanata, the
did not again become an independent province till 1811.
it surrendered fifteen communes to Benevento, and received
from Terra di Lavoro.

MOLLUSCA

Mollusca form one of the great "phyla," or sub-
inedoms of the Animal Pedigree or Kingdom.
ry History of the Group. The shell bearing forms
g to this group which were known to Linnæus were
y him (in 1748) in the third order of his class
under the name "Testacea," whilst the Echino
Hydroid, and Annelid, with the naked Molluscs,
his second order, termed "Zoophyta." Ten years
replaced the name "Zoophyta" by "Mollusca,"
as thus in the first instance applied, not to the
t at present so termed, but to a group consisting
f other organisms. Gradually, however, the term
became restricted to include those Mollusca formerly
mong the "Testacea," as well as the naked Mollusca.
mportant to observe that the term *μαλάκια*, of which
is merely a Latinized form, was used by Aristotle
te a group consisting of the Cuttle-fishes only.

definite erection of the Mollusca into the position
f the great primary group of the animal kingdom
George Cuvier (1788-1800), who largely occupied
with the dissection of representative of this type (1).
pendent anatomical investigation of the Mollusca
n carried on by the remarkable Neapolitan naturalist
li (1791), whose researches (2) were not published
ter his death (1817), and were followed by the
l work of another Neapolitan zoologist, the illus-
elle Chiaje (3).

"embranchement" or sub-kingdom Mollusca, as de-
Cuvier, included the following classes of shell-fish:
uttles or poulpes, under the name CEPHALOPODA; 2,
l, whelks, and slugs, both terrestrial and marine,
he name GASTEROPODA; 3, the sea-butterflies or
snails, under the name PTEROPODA; 4, the clams,
, and oysters, under the name ACEPHALA; 5, the
ells, under the name BRACHIOPODA; 6, the sea-
or ascidians, under the name NUDA; and 7, the
s and sea-acorns, under the name CIRRHOPODA.
main limitations of the sub-kingdom or phylum
a, as laid down by Cuvier, and the chief divisions
ognized within its limits by him, hold good to the
day. At the same time, three of the classes con-
by him as Mollusca have been one by one removed
t association in consequence of improved know-
nd one additional class, incorporated since his day
e Mollusca with general approval, has, after more
rty years, been again detached and assigned an
dent position owing to newly acquired knowledge
ost of Cuvier's classes to be removed from the Mol-
that of the Cirrhopoda. Their affinities with the
rustacea were recognized by Cuvier and his contem-
, but it was one of the brilliant discoveries of that
ble and too-little honoured naturalist, J. Vaughan
on of Cork, which decided their position as Crus-
The metamorphoses of the Cirrhopoda were described
ed by him in 1830 in a very complete manner,
legitimate conclusion as to their affinities was for-
by him (4). Thus it is to Thompson (1830), and
Burmeister (1834), as erroneously stated by Keferstein,
hat the merit of this discovery belongs. The next
be removed from Cuvier's Mollusca was that of the
etter known as Tunicata. In 1866 the Russian
ogist Kowalewsky startled the zoological world with
account of the developmental changes of Ascidia,
he Tunicata (5), and it became evident that the

affinities of that class were with the Vertebrata, whilst their
structural agreements with Mollusca were only superficial.
The last class which has been removed from the Cuvierian
Mollusca is that of the Lamp-shells or Brachiopoda. The
history of its dissociation is connected with that of the
class, viz., the Polyzoa or Bryozoa, which has been both
added to and again removed from the Mollusca between
Cuvier's date and the present day. The name of J.
Vaughan Thompson is again that which is primarily con-
nected with the history of a Molluscan class. In 1830
he pointed out that among the numerous kinds of "polypes"
at that time associated by naturalists with the Hydroida
there were many which had a peculiar and more elaborate
type of organization, and for these he proposed the name
Polyzoa (6). Subsequently (7) they were termed Bryozoa
by Ehrenberg (1831).

Henri Milne Edwards in 1844 demonstrated (8) the affi-
nities of the Polyzoa with the Molluscan class Brachiopoda,
and proposed to associate the three classes Brachiopoda,
Polyzoa, and Tunicata in a large group "Molluscoidea"
coordinate with the remaining classes of Cuvier's Mollusca,
which formed a group retaining the name Mollusca. By
subsequent writers the Polyzoa have in some cases been kept
apart from the Mollusca and classed with the "Vermes";
whilst by others (including the present writer) they have,
together with the Brachiopoda, been regarded as true Mol-
lusca. The recent investigation by Mr. Caldwell (1887)
of the developmental history of Phoronis (9), together
with other increase of knowledge, has now, however, estab-
lished the conclusion that the agreement of structure
supposed to obtain between Polyzoa and true Mollusca is
delusive; and accordingly they, together with the Brachio-
poda, have to be removed from the Molluscan phylum.
Further details in regard to this, the last revolution in Mol-
luscan classification, will be found in the article POLYZOA.

As thus finally purified by successive advances of em-
bryological research, the Mollusca are reduced to the
Cuvierian classes of Cephalopoda, Pteropoda, Gastropoda,
and Acephala. Certain modifications in the disposition of
these classes are naturally enough rendered necessary by
the vast accumulation of knowledge as to the anatomy and
embryology of the forms comprised in them during fifty
years. Foremost amongst those who have within this
period laboured in this group are the French zoologists
Henri Milne Edwards (20) and Lacaze Duthiers (21), to
the latter of whom we owe the most accurate dissections
and beautiful illustrations of a number of different types.
To Kölliker (22), Gegenbaur (23), and more recently Spengel
(24), amongst German anatomists, we are indebted for
epoch-making researches of the same kind. In England
Owen's anatomy of the Pearly Nautilus (10), Huxley's dis-
cussion of the general morphology of the Mollusca (11),
and Lankester's embryological investigations (12), have
aided in advancing our knowledge of the group. Two
remarkable works of a systematic character dealing with
the Mollusca deserve mention here—the *Manual of the
Mollusca* by the late Dr. S. P. Woodward, a model of clear
systematic exposition, and the exhaustive treatise on the
Malacozoa or Weichthiere by the late Professor Keferstein
of Göttingen, published as part of Bronn's *Classen und
Ordnungen des Thier-Reichs*. The latter work is the most
completely illustrated and most exhaustive survey of exist-
ing knowledge of a large division of the animal kingdom
which has ever been produced, and, whilst forming a monu-
ment to its lamented author, places the student of Mol-
luscan morphology in a peculiarly favourable position.

figures refer to the bibliography at the end of the article,

es of the Mollusca.—The classes of the Mollusca
ve recognize are as follows:

Phylum MOLLUSCA.

BRANCH A.—**Glossophora.**	BRANCH B.—**Lipocephala** (= Acephala, *Cuvier*).
—GASTROPODA.	Class 1.—LAMELLIBRANCHIA (Syn. Conchifera)
—*Isopleura.*	*Examples*—Oyster, Mussel, Clam, Cockle
mples Chiton, Neo enia.	
Anisopleura.	
mples Limpet, Whelk, nail, Slug.	
—SCAPHOPODA.	
mple—Tooth-shell.	
—CEPHALOPODA.	
Pteropoda.	
mples—Hyalæa, Pneu- nodermon.	
—*Siphonopoda.*	
mples—Nautilus, Cut es, Poulp.	

ral Characters of the Mollusca.—The forms com
in the above groups, whilst exhibiting an extreme
of variety in shape, as may be seen on comparing
ster, a Cuttle-fish, and a Sea-slug such as Doris,
adapted, some to life on dry land, others to the
of the sea, others to running streams, whilst capable,
swimming, others of burrowing, crawling, or jumpe
ne, on the other hand, fixed and immobile, some
t the most formidable of carnivores, others feed
vegetable mud, or on the minutest of micro-scopic
ms—yet all agree in possessing in common a very
rable number of structural details which are not
d in common by any other animal.

structural features which the Mollusca do possess
mon with other animals belonging to other great
of the animal kingdom are those characteristic of
lomata, one of the two great grades (the other and
being that of the Coelentera) into which the higher
s, or Enterozoa as distinguished from the Protozoa,
ided (**13**). The Enterozoa all commence their individ
istence as a single cell or plastid, which multiplies
y transverse division. Unlike the cells of the Proto
se embryonic cells of the Enterozoa do not remain each
neighbour and capable of independent life, but pro
arrange themselves in two layers, taking the form
. The cavity of the two cell layered sac or Diblas
us formed is the primitive gut or ARCHENTERON.
Coelentera, whatever subsequent changes of shape
tle sac may undergo as it grows up to be Polyp or
sh, the original archenteron remains as the one
pervading all regions of the body. In the Coelomat
h-enteron becomes in the course of development
into two totally distinct cavities shut off from one
r an axial cavity, the MET-ENTERON, which retain
uction of a digestive gut; and a peri-axial cavity,
LOM or body-cavity, which is essentially the blood
and receives the nutritive products of digestion and
aste products of tissue-change by osmosis. The
a agree in being Coelomate with the phyla Verte
Platyhelmia (Flat-worms), Echinoderma, Appendicu
nsects, Ringed-worms, &c.), and others. In fact,
l the Enterozoa except the Sponges, Corals, Polyps,
edusæ.

common with all other Coelomata, the Mollusca
one period of life possessed of a PROSTOMIUM
ion in front of the mouth, which is the essential
of the "head," and is connected with the property
ard locomotion in a definite direction and the steady
e of the body (as opposed to rotation of the body
long axis). As a result, the Coelomata, and with
he Mollusca, present (in the first instance) the general
condition of body known as BILATERAL SYMMETRY;
dorsal is differentiated from the ventral surface, whi
right and a left side similar to, or rather the complem
of, one another are permanently established. In com
with all other Coelomata, the Mollusca have the mouth
first part of the alimentary canal which leads into
met-enteron formed by a special invagination of the
layer of the primitive body-wall, not to be confounded
that which often, but not always, accompanies the
cedent formation of the arch-enteron; this invagina
n termed the STOMODÆUM. Similarly, an anal apertu
formed in connexion with a special invagination w
meets the hinder part of the met-enteron, and is te
the PROCTODÆUM.

In common with many (if not all) Coelomata, the
lusca are provided with at least one pair of tube-like org
which open each by one end into the cœlom or body-ca
and by the other end to the exterior, usually in the ne
bourhood of the anus. These are the NEPHRIDIA.

Like all other Coelomata, the Mollusca are also prov
with special groups of cells forming usually paired or me
growths upon the walls of the cœlomic cavity, the
being specially possessed of reproductive power, and
ferentiated as egg-cells and sperm-cells. These are
GONADS. As in other Coelomata, the cell of the ge
may escape to the exterior in one of two ways: e
through the nephridia, or, on the other hand, by sp
apertures.

As in all other Coelomata, the cells which bui
respectively the primary outer layer of the body
lining layer of the met-enteron, and the lining layer
cœlom, are multiplied and differentiated in a variet
ways in the course of growth from the early embry
condition. Tissues are formed by the adhesion of a
ber of similarly modified cells in definite tracts. As
Coelomata, there is a considerable variety of tissues,
acterized by, and differentiated in relation to, parti
physiological activities of the organism. Not only
Coelomata but also many Coelentera show, in additi
the EPITHELIA (the name given to tissue which form
free surfaces, whether it be that of the outer body wa
the gut, or of a blood-space), also deeper lying tis
of which the first to appear is MUSCULAR tissue, an
second NERVOUS tissue.

The epithelia are active in throwing off their constit
cells (blood corpuscles from the wall of the cœlom),
producing secretions (glands of body wall and of gu
in forming horny or calcareous plates, spines, and
, known as CUTICULAR DEPOSITS (shells and bo
of the body wall, teeth of the tongue, gizzard, &c.).

In the Mollusca, as in all other Coelomata, in corres
ence with the primary bilateral symmetry and in rel
to the special mechanical conditions of the proston
the nervous tissue which is in Coelentera, and even in
worms, diffused over the whole body in networks,
to concentrate in paired lateral tracts, having a s
enlargement in the pre-oral region. The earlier plex
arrangement is retained in the nervous tissue of the
of the alimentary canal of many Coelomata, whilst
centration to form large nerve masses (GANGLIA), to
numerous afferent and efferent fibres are attached, a
the nervous tissue of the body wall.

In all Coelomata, including Mollusca, muscular tis
developed in two chief layers, one subjacent to the de
outer epithelium (SOMATIC MUSCULATURE), and a secon
rounding the alimentary canal (SPLANCHNIC MUSCULAT
Thus, primarily, in Coelomata the body has the charac
two muscular sacs or tubes, placed one within the
and separated from one another by the cœlomic s
The somatic musculature is the more copious and de

very generally an outer circular layer (*i.e.*, a layer in which the muscular fibres run in a direction transverse to the long axis of the body) and a deeper longitudinal layer; to these oblique and radiating fibres may be added. The splanchnic musculature, though more delicate, exhibits a circular layer nearer the enteric epithelium, and a longitudinal layer nearer the colomic surface.

In Coelomata and in many Coelentera there are found distributed between the tracts of muscular tissue, bounding them and giving strength and consistency also to the walls of the body, of the alimentary canal, of the colom, and of the various organs and tissue masses (such as nerve centres, gonad, &c.) connected with these, tracts of tissue the function of which is skeletal. The SKELETAL TISSUE of Mollusca, in common with that of other Coelomata, exhibits a wide range of minute structure, and is of differing density in various parts, it may be fibrous, membranous, or cartilaginous. The Mollusca, in common with the other Coelomata, exhibit a remarkable kind of association between the various forms of skeletal tissue and the epithelium which lines the coelomic cavity. The colomic cavity contains a liquid which is albuminous in chemical composition (BLOOD-LYMPH or HÆMOLYMPH), and into this liquid cells are shed from the colomic epithelium. They float therein and are known as BLOOD CORPUSCLES or LYMPH CORPUSCLES. The coelomic space with its contained hæmolymph is not usually in Coelomata, and is not in Mollusca, a simple even walled cavity, but is broken up into numerous passages and recesses by the outgrowth, both of the alimentary canal and of its own walls. By the adhesion of its opposite walls, and by an irregularity in the process of increase of its area during growth, the colom becomes to a very large extent a spongy system of intercommunicating LACUNÆ or irregular spaces, filled with the coelomic fluid. At the same time, the coelomic space has a tendency to push its way in the form of narrow canals and recesses between the layers of skeletal tissue, and thus to permeate together with the skeletal tissue in the form of a spongy, or it may be a tubular, network all the apparently solid portions of the animal body. This association of the nutritive and skeletal function is accompanied by a complete identity of the tissues concerned in these functions. Not only is there complete gradation from one variety of skeletal tissue to another (*e.g.*, from membranous to fibrous, and from fibrous to cartilaginous) even in respect of the form of the cells and their intercellular substance, but the coelomic epithelium, and consequently the hæmolymph with its floating corpuscles derived from that epithelium, is brought into the same continuity. The skeletal and blood containing and producing tissues in fact form one widely varying but continuous whole, which may be called the SKELETOGENIC SYSTEM OF TISSUES.

In many Coelomata not only do the skeletal tissues allow the coelomic space with its fluid and corpuscles to penetrate between their layers, but a special mode of extension of that space is found, which consists in the hollowing out of the solid substance of elongated cells having the form of fibres, which thus become tubular, and, admitting the nutritive fluid, serve as channels for its distribution. These are "capillary vessels," and it has yet to be shown that such are formed in the Mollusca. Larger vessels, however, concerned in guiding the movement of the coelomic fluid in special directions are very usually developed in the Mollusca, as in other Coelomata, by the growth of skeletal tissue around what are at first ill-defined extensions of the coelomic space. In this way a portion of the coelomic space becomes converted into vessels, whilst a large part remains with irregular walls extending in every direction between the skeletal tissues and freely communicating with the system of vessels. As in many other Coelomata, muscular tissue grows around the largest vessel formed from the primitive cœlom, which thus becomes a contractile organ for propelling the blood-lymph fluid. This "HEART" has in Mollusca, as in most other Cœlomata in which it is developed, a dorsal position. A communication of the blood-lymph space with the exterior by means of a pore situated in the foot or elsewhere has been very generally asserted to be characteristic of Mollusca. It has been maintained that water is introduced by such a pore into the blood, or admitted into a special series of water-vessels. It has also been asserted that the blood-fluid is expelled by the Mollusca from these same pores. Recent investigation (14) has, however, made it probable that the pores are the pores of secreting-glands and do not lead into the vascular system. There is, it therefore appears, no admission or expulsion of water through such pores in connexion with the blood, although in some other Coelomata it is established that water is taken in to the cœlomic space through a pore (Echinoderms), whilst in some others there is no doubt that the cœlomic hæmolymph is occasionally discharged in quantity through pores of definite size and character (Earthworm, &c.).

We have thus seen that the Mollusca possess, in common with the other Coelomata—1, a body composed of a vast *number of cells* or plastids, arranged so as to form a sac-like *body wall*, and within that a second sac, the *met-entero*, the wall of which is separated from the first by a *cœlom*, blood-lymph space; 2, a *stomodæum* and a *proctodæum*; 3, a *prostomium*, together with a differentiated *dorsal* and *ventral* surface, and consequently *right* and *left sides*, and bilateral symmetry; 4, a pair of *nephridia*; 5, *gonads* developed on the wall of the cœlom; 6, *dermic* epithelium (producing horny and calcareous deposits on its surface), *enteric* epithelium, and *cœlomic* epithelium; 7, lateral paired masses of *nerve tissue*, especially large in the prostomial region (nerve centres or *ganglia*); 8, *muscular tissue*, forming a *somatic* tunic and a *splanchnic* tunic; 9, *skeletogenic tissues*, consisting of membranous, fibrous, and cartilaginous *supporting tissues*, and of *blood-vessels* and the walls of *blood spaces*, the *cœlomic epithelium*, and the liquid tissue known as *hæmolymph* (commonly blood).

Schematic Mollusc. Starting from this basis of structural features common to them and the rest of the Coelomata, we may now point out what are the peculiar developments of structure which characterize the Mollusca and lead to the inference that they are members of one peculiar branch or phylum of the animal pedigree. In attempting thus to set forth the dominating structural attributes of a great group of organisms it is not possible to make use of ordinary definitions. Of Mollusca, as of other great phyla, it is not possible categorically to enunciate a series of structural peculiarities which will be found to be true in reference to every member of the group. We have to remember that the process of adaptation in the course of long ages of development has removed in some cases one, in others another, of the original features characteristic of the ancestor from which the whole group may be supposed to have taken origin, and that it is possible (and actually realized in fact) that some organisms may have lost all the *primary* characteristics of Molluscan organization, and yet be beyond all doubt definitely stamped as Mollusca by the retention of some *secondary* characteristic which is so peculiar as to prove their relationship with other Mollusca. An example in point is found in the curious fish-like form Phyllirhoe (fig. 58), which has none of the primary characteristics of a Mollusc, and yet is indisputably proved to belong to the Molluscan phylum by possessing the peculiar and elaborate lingual apparatus present in one branch of the phylum, the Glossophora.

In order to exhibit concisely the peculiarities of organization which characterize the Mollusca, we find it most

nvenient to construct a schematic Mollusc, which shall ssess in an unexaggerated form the various structural rangements which are more or less specialized, exaggger- ed, or even suppressed, in particular members of the group.

g. 1.—Schem tic Mollusc. pe, in the sense which has been attributed to that wo d, or as the embodiment of an idea present to a creating mi d, or, even as an epitome of developmental laws. Were kn w- dge sufficient, we should wish to make this schem ic Mollusc the representation of the actual Molluscan an from which the various living forms have sprung. T nitely claim for our schematic form any such signi in the present state of knowledge would be pren but it may be taken as more or less coinciding with we are justified, under present conditions, in pictur ourselves as the original Mollusc or archi Mollusc correctly Archimalakion). After describing this sch form, we shall proceed to show how far it is reali ju tified in each class and order of Mollusca succes si

The schematic Mollusc (figs. 1, A to E) is oblo shape, bilaterally symmetrical, with strongly differ dorsal and ventral surface, and has a well-marked consisting of the prostomium (*s*) and the region diately behind the mouth. Upon the head we p pair of short CEPHALIC TENTACLES (*o*). The *mo* placed in the median line anteriorly, and is overhu the prostomium (B, *o*); the *anus* is placed in the m line posteriorly, well raised on the dorsal surface (The apertures of a pair of NEPHRIDIA are seen neighbourhood of the anus, right and left (A, *l*) the nephridial aperture, and in front of them, rig left, are the pair of apertures (*k*) appropriate to the of the GENERATIVE GLANDS (generative gland).

The most permanent and distinctive Mollusc-can is the foot (Podium). This is formed by an ex development of the somatic musculature along the v surface, distinctly coming at the region of the head, which is suddenly projects as a powerful muscular (B, *p*, E, *p*). It may be compared, probably g ally identical with the muscular ventral surface Planarians and with the sucker of Trematoda, but i extensively developed than are those corresponding tures. The muscular tissue of the foot and of al parts of the body of all Molluscs is cellular and mu as distinguished from the composite muscular fibr sisting of cell-fusions instead of separable cells) occurs in Arthropoda and in Vertebrata, and whic the further distinction of being composed of alter band of substance of differing refractive power "striated"). The appearance of cross-striation s the muscular cells of some Molluscs (odontoph Haliotis, Patella, &c.) requires further investigation is by no means altogether the same thing as the ing characteristic of striated muscular tissue.

Contrasting with the ventral foot is the thin- dorsal region of the body, which may be termed th podial region. The thin-walled region is formed b viscera covered in by the comparatively delicate an muscular body wall (figs. 1, E). A the ventral clearly separate from the posterior head, so is this region, and is conveniently spoken of as the VI SCERAL DOME or "hump" (*zg*). Protecting the viscera is a SHELL (concha), consisting of a horny basis i mixed with carbonate of lime, and secreted by the epithelium of this region of the body (*ca*). The in our schematic Mollusc is single, cap-shaped, and metrical. It does not lie entirely naked upon the of the visceral dome, but is embedded all round it to a large extent in the body wall. In fact, the ment of the visceral dome forms an open flatten in which the shell lies. This is the PRIMARY SAC, or FOLLICLE (A and B, *f*). The wall of the bod pects all round the visceral dome in the form of a skirt, so as to overhang and conceal to some exte head and the sides of the foot. This skirt, really a

[1] As to the minute structure of the shell in various cla Carpenter's article "Shell" in the *Cyclop. of Anat. and Physi* limits of our space do not permit us to deal with this or othe logical tones.

of the dorsal body wall, is called the MANTLE-FLAP
s pallialis), or more shortly the MANTLE or PALLIUM
he space between the overhanging mantle-flap and the
nd neck of the animal which it overhangs is called
E PALLIAL SPACE or CHAMBER. Posteriorly in this
re placed the anus and the pair of nephridial aper

development of the mantle-skirt and its sub-pallial
ppears to have a causal relation, in the way of pro
to a pair of processes of the body wall which
one on the right and one on the left, from the sides
body, nearer the anus than the mouth, and are
ed by the mantle-flap to some extent (A, B, *t*).
rocesses have an axis in which are two blood-vessels,
beset with two rows of flattened filaments, like the
f a comb in double series. These are the CTENIDIA
combs. Usually, as will be seen in the sequel, they
e part of gills, but since in many Mollusca (Lamelli
s) their function is not mainly respiratory, and since
ot completely formed gills are developed as a special
n some Mollusca to the exclusion of these pro
it is well not to speak of them simply as "gills" or
hiæ," but to give them a non-physiological name
that here proposed. Near the base of the stem of
enidium is a patch of the epithelium of the body
cularly modified and supplied with a special nerve
nglion. This is Spengel's olfactory organ, which
e respiratory fluid, and is persistent in its position
rve-supply throughout the group Mollusca. We
to call it the OSPHRADIUM

ing now to the internal organs, our schematic
is found to possess an ALIMENTARY CANAL, which
from mouth to anus, in the middle line, leaving
n it and the muscular body-wall a more or less
, in parts a spacious, CŒLOM. The *stomodæum* is
nd muscular, the *proctodæum* short, the bulk of
entary canal is therefore developed from the met-
or remnant of the archenteron after the cœlom
n pinched off from it. A paired outgrowth of the
eron forms the glandular diverticulum known as
estive gland or (commonly) liver (E, *a*, *l*).

ally to the alimentary tract the cœlom is spacious.
ce (C', E, *s*) is termed the PERICARDIUM, since it is
ed by a vessel running fore and aft in the median
hich has contractile muscular walls and serves as a
o propel the cœlomic blood-fluid. The pericardial
lthough apparently derived from the original cœlom,
n communication with the other spaces and blood-
derived from the cœlom; it never (or perhaps in a
v instances) contains in the adult the Mollusean blood
olymph, and is always in free communication with
terior through the tubes called *nephridia* (renal

The HEART receives symmetrically on each side,
d left, a dilated vessel bringing aerated blood from
adia. These dilated vessels are termed the *auricles*
e a', whilst the median portion itself, at the point
these vessels join it, is termed the *ventricle of the*
(*v*). The vessel passing fore and aft from the
e gives off a few trunks which open into spaces
œlom, the so-called lacunæ: these are excavated in
ection between the viscera and the various bundles
ous and muscular tissue, and may assume more or
character of tube-like vessels with definite walls.
and left opening into the pericardial cœlom is a
tube, the farther extremity of which opens to the
by the side of the anus. These two tubes (C', *n*)
symmetrically disposed NEPHRIDIA (renal organs).
GONADS (ovaries or spermaries) are placed in the
sal region of the cœlom (C', *t*), and have their own
es in the immediate neighbourhood of those of the

nephridia. The apertures are paired right and left,
are the ducts into which they lead; but at present
no ground for determining whether the gonad its
primarily in Molluscs a paired organ or a median
nor have we any well-founded conception as to the
of the ducts, when present, and their original relat

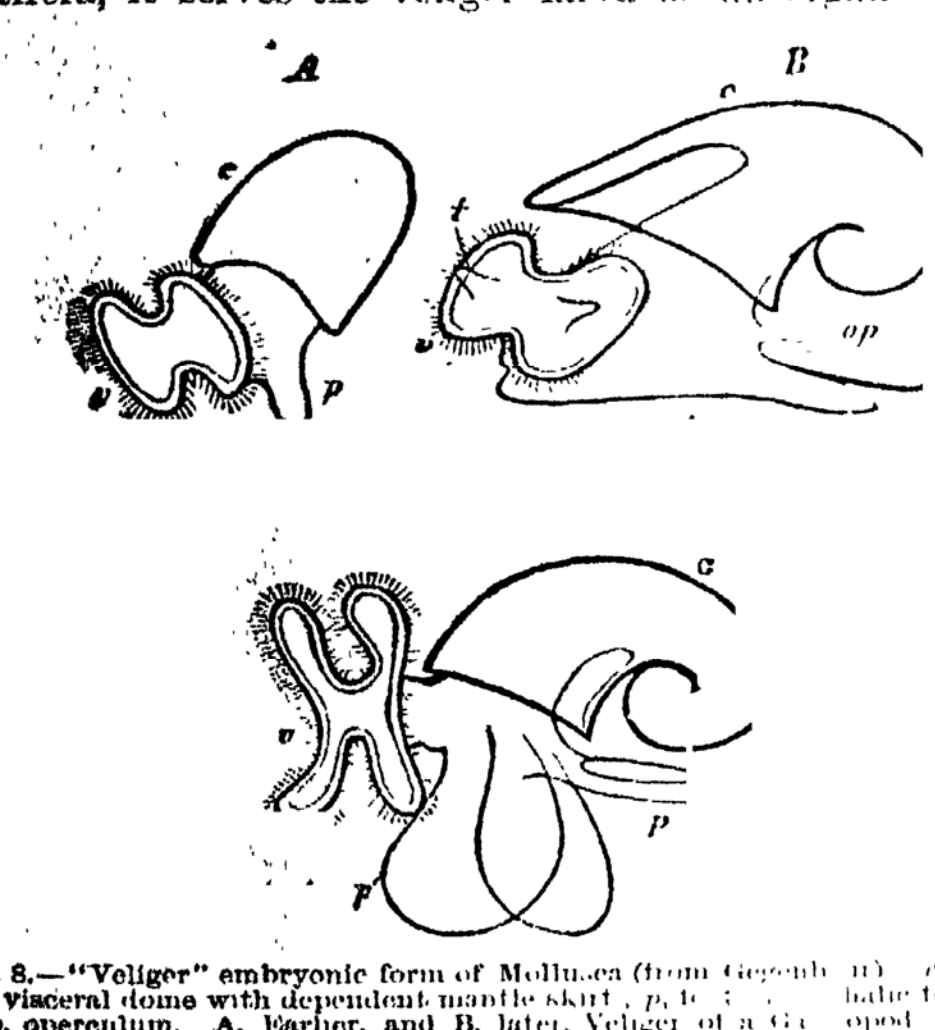
layer the foundations of the cœlomic cavity are lai
some Cœlomata these outgrowths are hollow and of
size. In Mollusca they are not hollow and large, w
probably the archaic condition, but they consist at
a few cells only, adherent to one another; these cell
diverge, applying themselves to the body-wall and
gut wall so as to form the lining layer of the cœ
cavity. Muscular tissue develops from deep-lying cel
the rudiments of the paired nerve-tracts from thick
of the dermic cell layer or ectoderm.

The external form meanwhile passes through highl
acteristic changes, which are on the whole fairly co
throughout the Mollusca. A circlet of cilia forms wh
embryo is still nearly spherical (fig. 4, F; fig. 6, E;

in an equatorial position. As growth proceeds, one nisphere remains relatively small, the other elongates and arges. Both mouth and anus are placed in the larger a; the smaller area is the prostomium simply; the cili- d band is therefore in front of the mouth. The larval m thus produced is known as the Trochosphere. It ctly agrees with the larval form of many Chætopod rms and other Cœlomata. Most remarkable is its eement with the adult form of the Wheel animalcules Rotifera, which retain the præ-oral ciliated band as their ef organ of locomotion and prehension throughout life far the young Molluse has not reached a definitely lluscan stage of development, being only in a condition mmon to it and other Cœlomata. It now passes to the igor phase, a definitely Molluscan form, in which the proportion between the area in front of the ciliated let and that behind it is very greatly increased, so t the former is now simply an emarginated region of head fringed with cilia (fig. 8; fig. 6, F; fig. 7, F, d fig. 60, A). It is termed the "velum," and is frequently drawn out into lobes and processes. As in the tifera, it serves the veliger larva as an organ of loco



8.—"Veliger" embryonic form of Mollusca (from Gegenbaur). *c*, ve visceral dome with dependent mantle skirt; *p*, fo operculum. A, Earlier, and B, later, Veliger of a Gas r of a Pteropod showing lobe-like processes of the vel ured outgrowths of the foot.

tion. In a very few Molluses, but notably in the Com- n Pond-Snail, the emarginated bilobed velum is re ned in full proportions in adult life (fig. 70), having t its marginal fringe of specially long cilia and its omotor function. The body of the Veliger is char erized by the development of the visceral hump on surface, and by that of the foot on the other. Growth greater in the vertical dorso-ventral axis than in the gitudinal oro-anal axis; consequently the foot is relely small and projects as a blunt process between mouth d anus, which are not widely distant from one another, ilst the antipedal area projects in the form of a great mp or dome. In the centre of this antipedal area there appeared (often at a very early period) a gland-like pression or follicle of the integument (fig. 6, C, *sk*; fig. 7, F, *shgl*; fig. 60, B; fig. 68, *shs*; fig. 72***, *ss*). This is primitive shell-sac discovered by Lankester (18) in 1871, d shown by him to precede the development of the permant shell in a variety of Molluscan types. The cavity of s small sac becomes filled by a horny substance, and then very usually disappears, whilst a delicate shell, commencing from this spot as a centre, forms and spreads upon surface of the visceral dome.

The embryonic shell-sac or shell-gland represents transient form, in the individual development of Mollusca, that condition of the shell-forming area we have sketched above in the schematic Mollusc very few instances (in Chiton, and probably in Lima we shall see below, the *primitive shell-sac* is retained enlarged as the permanent shell-forming area. It is planted in other Molluscs by a *secondary shell-forming area*, namely, that afforded by the free surface of visceral hump, the shell-forming activity of which ex even to the surface of the depending mantle-skirt. Accordingly, in most Mollusca the *primitive shell* is represented only by the horny plug of the primitive shell-sac. The permanent shell is a new formation on a new area, should be distinguished as a *secondary shell*.

The ctenidia, it will be observed, have not yet been mentioned, and they are indeed the last of the chief Mollusc organs to make their appearance in ontogeny. A possible relation to the pra-oral and post-oral ciliated bands of embryos similar to the Trochosphere are discussed by the writer in the *Quart. Jour. Micr. Sci.*, vol. xv. p. 423. The Veliger, as soon as its shell begins to assume a definite shape, is no longer of a form common to various classes of Mollusca, but acquires characters peculiar to its class. At this point, therefore, we shall for the present leave it.

Systematic Review of the Classes and Orders of Mollusca.

We are now in a position to pass systematically to review the various groups of Mollusca, showing in what way they conform to the organization of our schematic Molluse, and in what special ways they have modified, even suppressed parts present in it, or phases in the representative embryonic history which has just been sketched. It will be found that the foot, the shell, the mantle, and the ctenidia, undergo the most remarkable changes of form and proportionate development in the various classes, changes which are correlated with extreme changes of elaboration in the respective functions of those parts.

Division of the Phylum into two Branches. The Mollusca are sharply divided into two great lines of descent or branches, according as the pro-tomial region is atrophied on the one hand, or largely developed on the other.

The probabilities are in favour of any ancestral form of the hypothetical ancient Mollusc which connected the Mollusca with their non-Molluscan forefathers having succeeded, as do all the more primitive forms of Cœlomata, a well-marked pro-tomium, and consequently a head, one series of Mollusca descended from the primitive head-bearing Mollusc have acquired an organization in which the Molluscan characters have become modified in definite relation to a sessile or inactive life. As the most prominent result of the adaptation to such sessile life they exhibit an atrophy of the cephalic region. They form the branch Prosoneura—the mussels, oysters, cockles, clams. The other Mollusca have retained an active, in many cases a highly aggressive, mode of life; they have, correspondingly, not only retained a well-developed head, but have developed a special aggressive organ in connection with the mouth, which, on account of its remarkable nature and the peculiarities of the details of its mechanism, seems to indicate a very close genetic connexion between all the animals which possess it. This remarkable organ is the odontophore, consisting of a lingual ribbon, rasp, or radula with its cushion and muscles. On account of the possession of this organ this great branch of the Mollusca phylum may be best designated Glossophora. Any

merely points to the possession of a head is objec-
e, since this is common to them and the hypotheti-
hi Mollusca from which they descend. The term
phora, which has been applied to them, is also un-
, since the organ which characterizes them is not a
but a tongue.

also been seen in living transparent Gastropods. T
tinous ribbon is continuously growing forward fr
tube like diverticulum as a finger nail does on its be
thus the wearing away of the part which rests on t
tilage and is brought into active use, is made up
the advance of the ribbon in the same way as the w
down of the finger-nail is counterbalanced by its o
ward growth. And, just as the new substance
finger nail is formed in the concealed part, sunk post
below a fold of skin, and yet is continually carried f
with the forward movement of the bed on which it
and which forms its undermost layers, so is the ne
stance of the radula formed in the compressed ext
of the radular sac (*n*), and carried forward by the f
movement of the bed (*o*) on which it rests, and by
is formed its undermost layer. This forward-movi
is not merely the ventral wall of the radular diverti
but includes also that portion of the floor of the ora
to which the radula adheres (as far forward as the
in fig. 9, A). At the spot where the radula ceases, t
ward growth-movement of the floor also ceases, jus
the case of the finger-nail the similar growth-mo
cease at the line where the nail becomes free.

The radula or cuticular product of the slowly-r
bed can be stripped off, and is then found to consi
ribbon " e area, upon which are set numerous toc
proces of various form in transverse rows, which
one an et elo-ely, and exactly resemble one another
form of their teeth (fig. 9, B). The tooth-like proces
single tran verse row are of very different shape an
ber in different members of the Glossophora, and it
sible to use a formula for their description. Thu
in each row there is a single median tooth with thre
on each side of it more or less closely resembli
another, as in fig. 9, C, we write the formula 3.1.3.
there are additional lateral pieces of a different s
those immediately adjoining the central tooth, w
cate them by the figure 0, repeated to represen
number, thus 0000.1.1.1.0000 is the formula
lingual teeth of *Chiton Stelleri*. A single median
an admedian series, and a lateral series may be t
tinguished In some Glossophora only median te
present, or large median teeth with a single sm
median tooth on each side of it (fig. 9, H); th
termed Rachiglossa (formula, —.—.1.— or 1.1.1). In
number of Glossophora we have three admedian
side and one median, no lateral pieces (fig. 9, G)
are termed Taenioglossa (formula, 3.1.3). Those with
rous lateral pieces, four to six or more admedian
and a median piece or tooth (fig. 9, C) are termed
doglossa (formula, x.6.1.6.x, where x stands for a
finite number of lateral pieces). The Toxogloss

the central tooth being absent and the lateral teeth
rly long and connected with muscles. The term
lossa (fig. 9, D) is applied to those Glossophora
ch the radula presents no median tooth, but an
ite and large number of admedian teeth, giving
mula x.0.x. When the admedian teeth are inde-
forty to fifty), and a median tooth is present, the
Myriaglossa is applied (formula, x.1.x). It must be
tood that the pieces or teeth thus formulated may
lves vary much in form, being either flat plates, or
lated, hooked, or spine like bodies. We shall revert
terms thus explained in the systematic descriptions
groups of Glossophora.

muscular development in connexion with the whole
mass, and with each part of the radular apparatus,
edingly complicated,—as many as twenty distinct
s having been enumerated in connexion with thi

In addition to the radula, and correlated with its
oment, we find almost universally present in the
ohora a pair of horny jaws (usually calcified) de-
l as cuticular productions upon the epidermis of the
g. 9, A, *b*). The radula and the shelly jaws of the
ohora enable their possessors not only to voraciously
vegetable food, but the radula is used in some in
for boring the shells of other Mollusca, and the
r crushing the shells of Crustacea, and for wound-
n Vertebrata.

PHYLUM MOLLUSCA.

BRANCH A.—*GLOSSOPHORA*.

racters.—Mollusca with head-region more or less
ently developed; always provided with a peculiar
g-tongue—the odontophore rising from the floor of
cal cavity.

Glossophora comprise three classes, chiefly distin-
l from one another by the modifications of the foot.

Class 1.—GASTROPODA.

racters.—Glossophora in which (with special excep-
swimming forms) the FOOT is simple, median in
n, and flattened so as to form a broad sole like sur
the contractions of which the animal crawls, often
into three successive regions—the pro-, meso-, and
odium—by lateral constrictions.

Gastropoda exhibit two divergent lines of descent
ed by the term sub-class (see p. 619).

Sub-class 1.—GASTROPODA ISOPLEURA.

racters.—Gastropoda in which not only the head
ot but also the visceral dome with its contents and
ntle retain the primitive BILATERAL SYMMETRY of
hi-Mollusc. The anus retains its position in the
line at the posterior end of the body. The whole
l mass together with the foot is elongated, so that
s joining mouth and anus is relatively long, whilst
rso-pedal axis at right angles to it is short. The
IA, the NEPHRIDIA, GENITAL DUCTS, and CIRCULA
RGANS are paired and bilaterally symmetrical. The
nd visceral NERVE-CORDS are straight, parallel with
other, and all extend the whole length of the body;
nglionic enlargements are feebly or not at all deve
The Isopleura comprise three orders.

Order 1.—**Polyplacophora** (the Chitons).

racters.—Gastropoda Isopleura with a metameric re-
n of the shell to the number of eight. The shells of
nitive type are partially or wholly concealed in shell-
mparable to the single embryonic shell-sac of other
ca. On the surface of the mantle-flap numerous calcified spines and knobs are frequently developed
ctenidia are of the typical form, small in size, an
merically repeated along the sides of the body

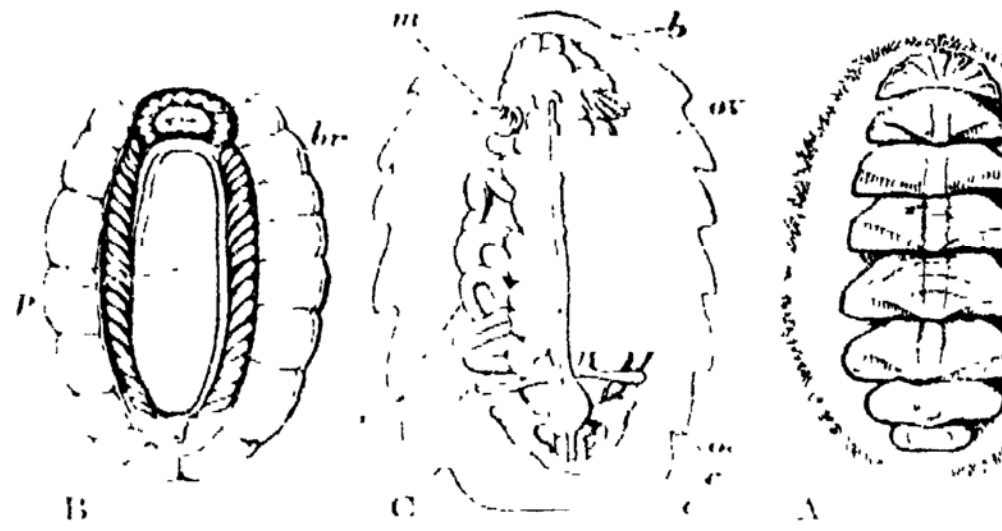

FIG. 10.—Three views of Chiton. A, Dorsal view of *Chiton Hu*
Middendorff) showing the eight shells. B, View of the ventral surface of a specimen of Chiton from the Indian Ocean, showing the mouth at the other end of the foot is seen the anus, situated on a pap
genital furrow, *br*, the branchiæ or ctenidia (branchial plumes) protrudi
these, and all round the animal is the mouth-fold. (After Cuvier.) C, Dorsal view of one specimen of Chiton, with the shells removed and the dorsal mantle reflected. *b*, buccal mass; *m*, retractor muscle of the buccal mass; *ov*, ovary; *ovd*, oviduct; *r*, coil of intestine; *v*, aorta; *v*, left auricle and ventricle.

number of sixteen or more; an osphradium or "olfactory epithelium" (Spengel) is found at the each ctenidium. The other organs are not subj metameric repetition. The odontophore is highly oped; the teeth of the lingual ribbon are varied in t several in each transverse row (fig. 9, E). Paired ducts distinct from the paired nephridia are present

The order Polyplacophora contains but one fam *Chitonida*, with the genera: *Chiton*, Lin. (figs. 10, I *Cryptochiton*, Midd., 1847, and *Cryptoplax* (= *Chito* Blainv., 1818.

Order 2. **Neomeniæ.**

Characters.—Gastropoda Isopleura devoid of which is replaced by innumerable microscopic plates or spicules set in the dorsal epidermis; man not lateral, but reduced to a small collar surroundi

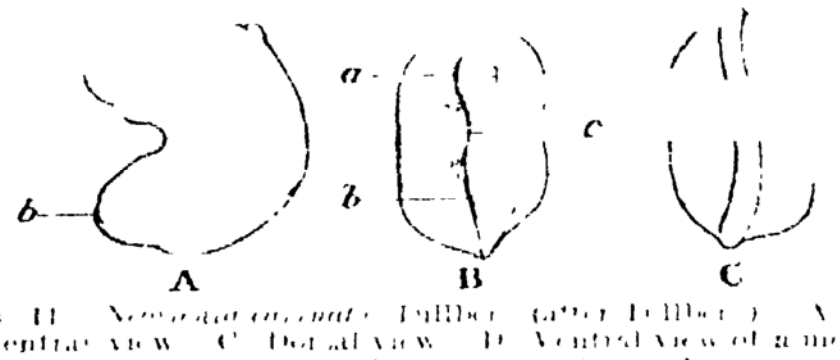

FIG. 11.—*Neomenia carinata*, Tullberg (after Tullberg). A, Lateral v Ventral view. C, Dorsal view. D, Ventral view of a more extend mal. *a*, anterior; *p*, posterior extremity; *s*, furrow, in which th foot is concealed.

anus, ctenidia represented by a symmetrical group dinal filaments on either side of the anus, foot very sunk in a groove, odontophore feebly developed, radula many-toothed; gonads placed in the peric discharging by the nephridia; no special generative

The order Neomeniæ contains the two genera *Ne* Tullberg (*Solenopus*, *Sars*) (fig. 11); and *Prone* Hubrecht.

Order 3. **Chætoderma**

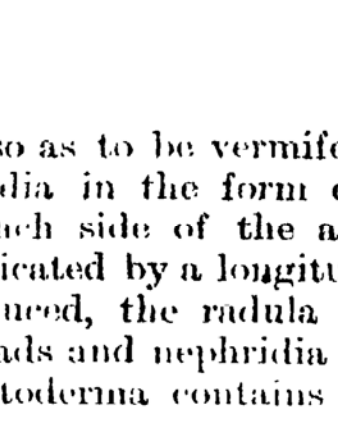
Characters.—Gastropoda Isopleura devoid of which is replaced by numerous minute calcareous

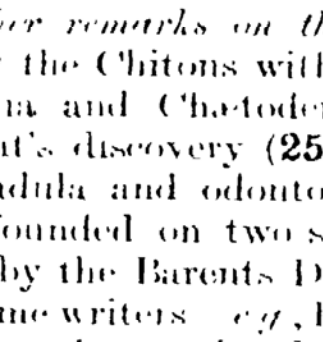
FIG. 12.—*Chætoderma nitidulum*, Loven (after Graff). The cephalic mental (*c*) to the left, the anal chamber (reduced genital chamber, *c* the concealed pair of ctenidia) to the right.

standing up like hairs on the surface of the body

longated so as to be vermiform; mantle-flap as in
niæ; ctenidia in the form of a pair of branchial
one on each side of the anus; foot aborted, its
being indicated by a longitudinal furrow; odonto-
reatly reduced, the radula only represented by a
oth; gonads and nephridia as in Neomenia.
order Chætoderma contains the single genus *Chæ-*
(fig. 12).

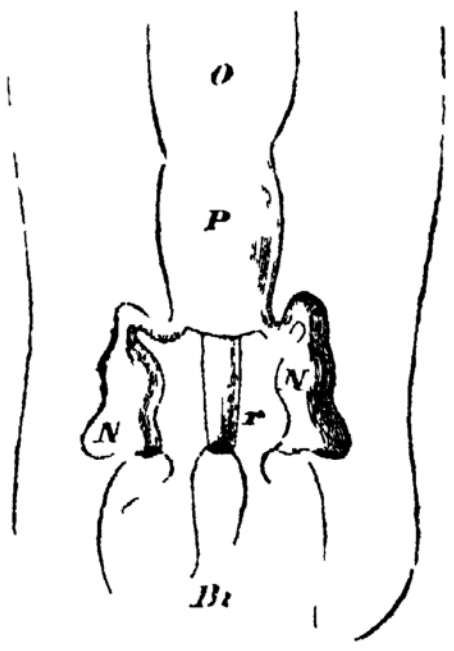
er remarks on the Isopleurous Gastropods. The
the Chitons with the remarkable worm like forms
a and Chætoderma was rendered necessary by
t's discovery (25) in 1881 of a definitely consti-
adula and odontophore in his new genus Proneo
ounded on two specimens brought from the arctic
by the Barents Dutch expedition.
ne writers *e.g.*, Keferstein the Chitons have been
nately associated with the other Gastropoda, whilst,
other hand, Gegenbaur seems to have gone a great
far in separating them altogether from the other
as a primary subdivision of that phylum, inas-
much as they are inti
mately bound to the
other Glossophora by
the possession of a
thoroughly typical
and well developed
odontophore. They
undoubtedly stand
nearer to the archi
Mollusca than any
other Glossophora in
having retained a com
plete bilateral sym
metry and the primi-
tive shell-sac, though
the metameric repe-
tition of this organ
and of the ctenidia is
a complication of, and
departure from, the
primitive character.
It is not improbable
that in the calcareous
spines and plates of
the dorsal integument
of Neomenia and Cha-
toderma, which occur
also on the part of
the dorsum uncovered
by shell in Chiton, we
have the retention of
ion preceding the development of the solid Mol-
hell, or a reversion to it. The minute calcareous
ay have the same relation to a compact shell which
een denticles of the sharks have to a continuous
one.

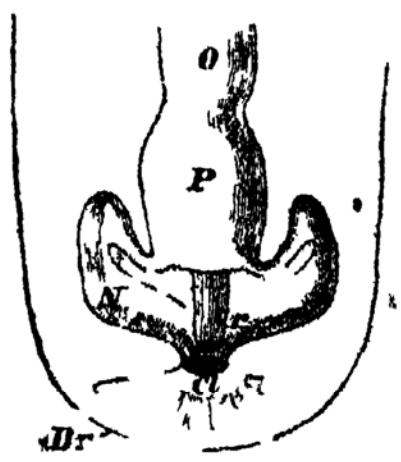


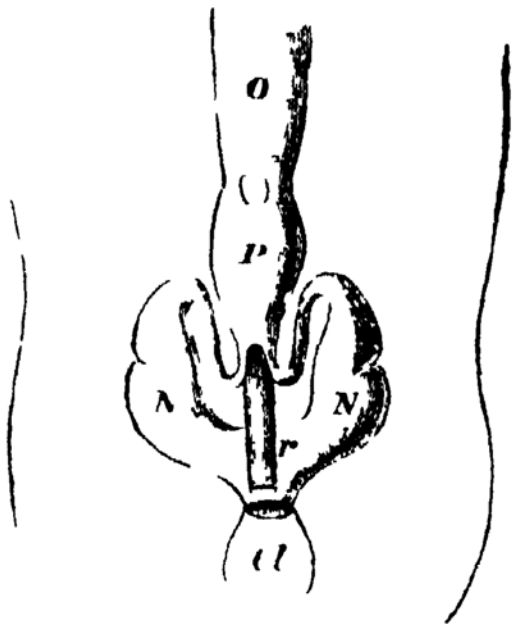


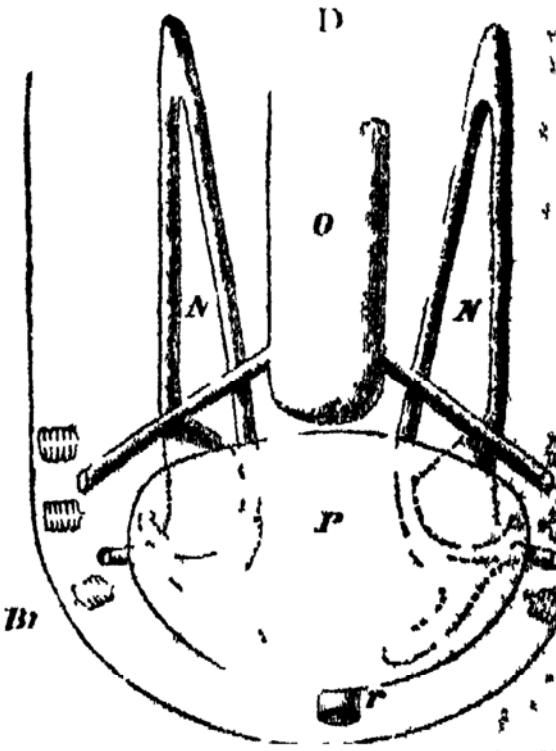
iagrams of the alimentary canal of
(from Hubrecht). *o*, mouth; *d*, anus; *a*, alimentary canal; *l*, liver (digestive gland). A. Neomenia and Proneomenia. B.

natomy of the Gastropoda Isopleura has been largely
d within the past year by the researches of
t and of Sedgwick, who have been the first to
e method of sections to the study of this group.
eading points in the modifications of mantle-flap,
l ctenidia are set forth in the preceding summaries,
he accompanying references to the figures. With
to other organs, we have to note the form of
nentary canal (fig. 13), which is simplest in
rma, symmetrically sacculated in Neomenia, and
upon itself, forming a few coils, in Chiton. The
as a compact liver with arborescent duct, which is
ted by the sacculi in Neomenia and by a single
cæcum in Chætoderma. Salivary glands are present in Chiton and in Proneomenia. The radula is highly developed in Chiton, and, though present in Proneomenia, has not been described in Neomenia. A single tooth in Chætoderma appears to represent the radula in a reduced state. The circulatory organs of Chiton alone are known with any degree of detail (fig. 10, C). There is a median dorsal blood-vessel—the aorta—which is enlarged to form a ventricle in the posterior region of the body. On either side the ventricle is connected to a well-developed auricle, which pours into it the aerated blood from the gills (ctenidia). The extent to which vascular trunks are developed has not been determined, but vessels to and from the ctenidia, and in the mid-line of the foot, are known. As in other Mollusca, the vessels do not extend far, but lead into lacunæ between the organs and tissues. Dorsal and ventral vessels have been detected in Neomenia and Chætoderma, but no specialized heart.









A–C. Excretory and reproductive organs of Isopleura (after Hubrecht). *O*, ovary; *P*, pericardium; *N*, nephridium; *u*, external aperture of nephridium; *g*, external aperture of the genital duct of Chiton; *r*, rectum; *Cl*, cloacal or pallial chamber of Neomenia and Chætoderma; *Br*, ctenidia (branchial plumes). A. Chætoderma. B. Neomenia. C. Proneomenia. D. Chiton.

The heart of Chiton lies in a space which is to be regarded as a specialized part of the cœlom, and, as in other Mollusca, is termed the pericardium. In front of this space in Chiton lies the ovary (fig. 14, D). In the other Isopleura the genital bodies (gonads) lie in the pericardium, which has a longer form and extends dorsally above the intestine. Opening into the pericardium equally in all the Isopleura (fig. 14) is a pair of bent tubes which lead to the exterior. These are the nephridia, which in Chiton are essentially renal in function. Their disposition has been determined by Sedgwick (26), who has shown that each nephridium is much bent on itself, so that, as in the

ridia of Conchifera (organ of Bojanus), the internal ture lies near the external. From the folded stem of nephridium very numerous secreting caeca are given off, mitted in the dia- (fig. 14, D), but rately drawn in 5. The sexes in on are distinct, the ovary or testis, he case may be, gh lying in and g a chamber of original coelom, not discharge into pericardium, but its own ducts, h pass to the ex r just in front of e of the nephridia 14, D, *g*, and fig. In this respect on is less primi- than the other Iso- ra, and even than other Gastropods Zygobranchia), some Conchifera ndylus, &c.), which no special genital tures, but make use he nephridia for purpose. In *Chiton cepans*, in which e are sixteen pairs enidia, the orifices he nephridia are cident with the six- th pair of ctenidia, e of the genital s with a point between the thirteenth and fourteenth idia.

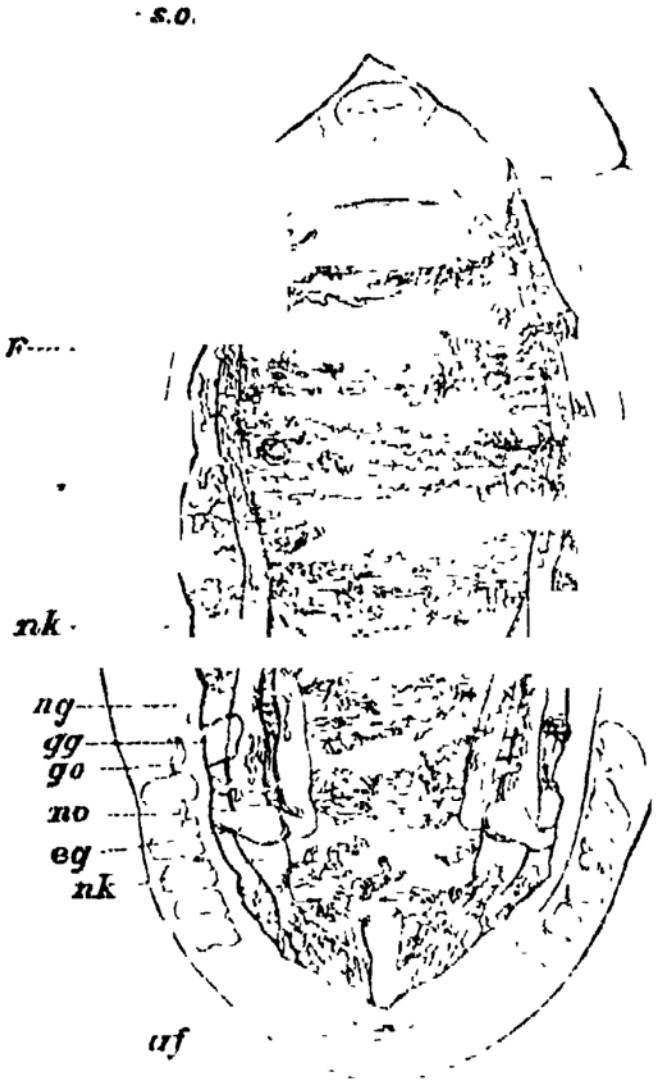


FIG. 15.—Dissection of the renal organs (nephridia) of *Chiton squamosus*, after Haller (*Arbeiten, Zool. Instit.*, Vienna, 1882). *f*, foot; *l*, edge of the mantle not removed in the front part of the specimen; *s.o.*, œsophagus; *af*, anus; *no*, genital duct; *go*, external opening of the same; *eg*, stem of the nephridium leading to *no*, its external aperture; *nk*, reflected portion of the nephridial stem; *ng*, fine cæca of the nephridium, which are seen ramifying transversely over the whole inner surface of the pedal muscular mass.

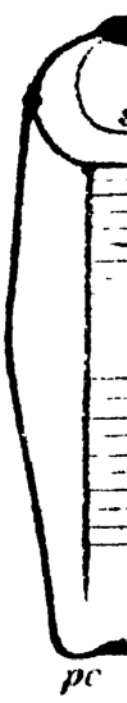
n the Neomeniæ and Chætoderma the nephridia are short and wide (*N* in fig. 14, A, B, C), and function as excretory ducts for the genital products, the gonads being lodged in the long pericardium. Their separate or united apertures open near the anus into the small chamber formed by the restriction of the mantle-skirt to the immediate neighbourhood of the anus.

16.—Ovary and oviducts *Chiton siculus* (after Hal- loc. cit.). *vb*, *hb*, anterior posterior suspensor of ovary; *U*, uterus (en- ged part of oviduct); *a*, duct.

The nervous system of the Gastropoda Isopleura is represented in the diagram fig. 17. In all it is important to observe that nerve ganglion cells are by no means limited to special swellings—the ganglia—but are abundant along the whole course of the four great longitudinal trunks. This is a primitive character comparable to that presented by the nerve-cords of Nemertine worms, and of the Arthropod Peripatus. Higher differentiation in other Mollusca leads to predominance if not an exclusive

sence of nerve-*fibres* in the cords, and of nerve-*ganglion* in the specialized ganglia. The numerous transverse nexions of the pedal nerve-cords in Chiton and Neomenia (seen also in Fissurella (fig. 36) and some Gastropods) are comparable to the transverse com of the ventral nerve-cords of Chætopod worms and Arthropods. In the abundance of the nervous network connected with its longitudinal nerve-tracts, Chiton appears to retain something of the early condition of the Coelomate nervous system when it had the form of a subepidermic network or nerve tunic (seen more clearly in Planarians and some Nemertines), and when the concentration into definitely compacted cords had not set in.



Ganglia are, however, distinguishable on the nervous cords of Chiton (fig. 18). The cerebral ganglia are not distinguishable as such, but a pair of buccal ganglia (B in fig. 18) are developed on two connectives which pass forward from the cerebral region to the great muscular mass of the mouth. These buccal ganglia are special developments connected with the special muscularity of the lips and odontophore, and are found in all Glossophora, but not in the Lipocephala. Such special ganglia related to organs (and not introduced in our schematic Moll

16.—Ovary and oviducts *Chiton siculus* (after Hal- loc. cit.). *vb*, *hb*, anterior posterior suspensor of ovary; *U*, uterus (en- ged part of oviduct); *a*, duct.

The sublingual ganglia are not lettered.

1) we find in connexi the siphons of the phala, and in vario tion upon the viscera cords of other Mollus Glossophora and Lipo A pair of pedal gan little developed (*p* in and a special group lingual ganglia are pr Chiton. On the wh nervous system of pleura is exceedingly and archaic, whilst it well serve as a ty which to compare other Mollusca on ac the small amount of tration of its nerve cells into ganglia, suc find well developed forms.

The development of Neomenia and Chætoder

g is entirely unknown, that of Chiton only par- Impregnation is effected when the eggs have been ged and are lying beneath the mantle-skirt. A phere larva is developed from the Diblastula of (Loven).

Chitons are found in the littoral zone in all parts of ld and are exclusively marine. Neomenia, Proneo nd Chaetoderma have hitherto been dredged from able depths (100 fathoms and upwards) in the a, Proneomenia also in the Mediterranean (Marion).

Sub-class 2. GASTROPODA ANISOPLEURA.

Definition. Gastropoda in which, whilst the head and am the bilateral symmetry of the archi-Mollusca, eral dome, including the mantle-flap dependent from he region on which are placed the ctenidia, anus, ve and nephridial apertures, have been subjected ation tending to bring the anus from its posterior position, by a movement along the right side, to a position above the right side of the animal's even to the middle line above the neck. This connected mechanically with the excessive vertical of the visceral hump and the development upon e of a heavy shell. The shell is not a plate en n a shell-sac, but the primitive shell-sac appears ppears in the course of embryonic development, and vely large mantiloid shell (with rare exceptions) over the whole surface of the visceral hump and hart. Whilst such a shell might retain its median in a swimming animal, it and the visceral hump ly fall to one side in a creeping animal which hem uppermost.

hell and visceral hump in the Anisopleura incline

The unitwisted visceral loop highly shaded. *cer*, cerebral ganglion; *pl*, pleural ganglion; *ped*, pedal ganglion; *ab*, abdominal ganglion which represents also the supra-intestinal ganglion of Streptoneura and gives off the nerve to the osphradium (olfactory organ) *o* and another to the left-lying supra-intestinal ganglion. The buccal nerves and ganglia omitted. (After Spengel.)

ode (desmid) so as to show the effect of torsion and subsequent rotation of the visceral hump in Streptoneurous Gastropoda: *A*, incipient torsion; *B*, greater rotation; *C*, complete torsion (the latter rotation being chiefly in the pleural region); *an*, anus; *ctenidium*, primarily left or pleural and primarily right or pedal ctenidium; *lvg*, primarily left (subsequently the sub-intestinal) visceral ganglion; *rvg*, primarily right (subsequently the supra-intestinal) visceral ganglion; *cer.g*, cerebral ganglion; *pl.g*, pleural ganglion; *ped.g*, pedal ganglion; *abg*, abdominal ganglion; *buc.c*, buccal connectives; *w*, wall of the mantle-cavity; *x*, pins fastening the elastic cord (dotted) along the visceral loop in *B*.

to the right side of the animal. As mechanical there arise a one-sided pressure and a one-sided together with a one-sided development of the muscles which are related to the shell and foot. TORSION THROUGH A SEMICIRCLE of the base of the dome and the continued heliotropic spiral growth visceral dome itself, which is very usual in the ura, appear to be traceable to these mechanical es. Atrophy of the representatives on one side ody of paired organs is very usual. Those placed ly on the left side of the rectum, which in virtue sion become the right side, are the set which suffer 19). Some Anisopleura, after having thus acquired ly marked inequilateral character in regard to such s the ctenidia, nephridia, genital ducts, heart, and appear by further change of conditions of growth to quired a superficial bilateral symmetry, the second

ary nature of which is revealed by anatomical examination (Opisthobranchia, Natantia).

In all groups of Anisopleura examples are numerous in which the shell is greatly developed, forming a "house" into which the whole animal can be withdrawn, the entrance being often closed by a second shelly piece carried upon the foot (the operculum). The power of rapidly extending and of again contracting large regions of the body to an enormous degree is usual, as in the Lipocephalous Mollusca. In spite of the theories which have been held on this matter, it appears highly probable that no fluid from without is introduced into the blood, nor is any expelled during these changes of form. A large mucous gland with a median pore is usually developed on the ventral surface of the foot, comparable to the similar gland and pore in Lipocephala, and in some cases (*e.g.*, Pyrula, fig. 37, B) this has been mistaken for a water-pore.

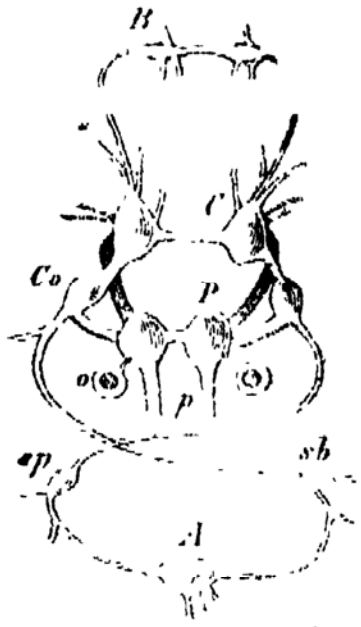

Fig. 21.—Nervous system of Paludina as a type of the Streptoneurous condition. *B*, buccal (sub-oesophageal) ganglion; *C*, cerebral ganglion; *Co*, pleural ganglion; *P*, pedal ganglion with otocyst attached; *p*, pedal nerve; *d*, abdominal ganglion at the extremity of the twisted visceral "loop"; *sp*, supra-intestinal visceral ganglion on the course of the right visceral cord; *sh*, sub-intestinal ganglion on the course of the left visceral cord. (From Gegenbaur, after Jhering.)

The heliotropic torsion of the visceral dome has had less deep-seated effect in one series of Anisopleura than in another. Accordingly, as the loop formed by the two VISCERAL NERVES (fig. 19) is or is not caught, as it were, in the twist, we are able to distinguish one branch or line of descent with straight visceral nerves—the EUTHYNEURA

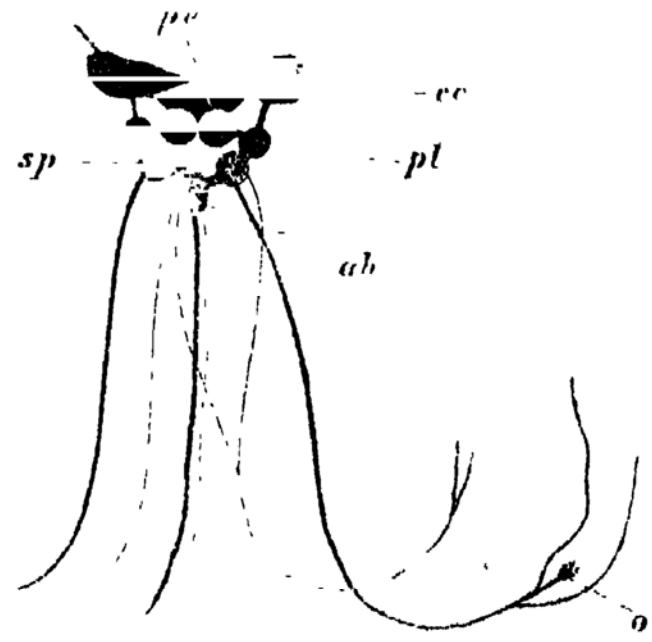

Fig. 22.—Nervous system of the Pond-Snail, *Limnæus stagnalis*, as a type of the short looped Euthyneurous condition. The short visceral "loop" with its three ganglia is lightly-shaded. *ce*, cerebral ganglion; *pe*, pedal ganglion; *pl*, pleural ganglion, *ab*, abdominal ganglion; *sp*, visceral ganglion of the left side, opposite to it is the visceral ganglion of the right side, which gives off the long nerve to the olfactory ganglion and osphradium *o*. In Planorbis and in Auricula (Pulmonata, allied to Limnæus) the olfactory organ is on the *left* side and receives its nerve from the *left* visceral ganglion. (After Spengel.)

(fig. 20)—from a second branch with the visceral nerves

into a figure-of-eight—the STREPTONEURA (fig. Probably the Euthyneura and the Streptoneura veloped independently from the ancestral bilater nmetrical Gastropods. The escape of the visceral oop from the torsion depends on its having acquired what deeper position and shorter extent, previously commencement of the phenomenon of torsion, ancestors of the Euthyneura than in those of reptoneura. In the ancestral Streptoneura the loop was lateral and superficial as in the living ra.

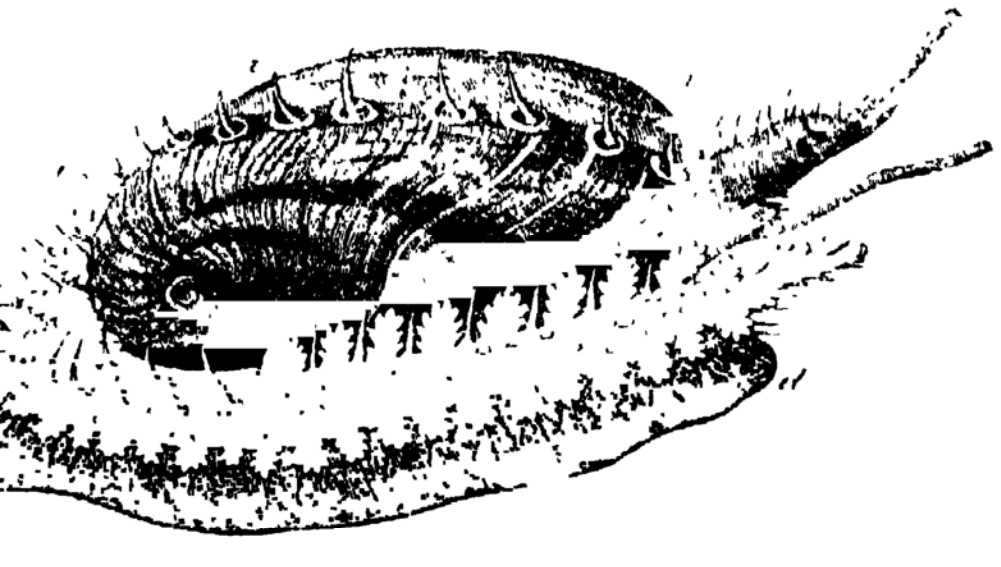
anch *a.*—*STREPTONEURA* (Spengel, 1881)

racters.—Gastropoda Anisopleura in which the "loop" (the conterminous visceral nerves) was nt to the body-wall and so shared in the torsion of ceral hump, the right cord crossing above the left form a figure-of-eight (see fig. 19).

Streptoneura comprise two orders the Zygoa and the Azygobranchia

Order 1.—Zygobranchia.

racters.—Streptoneura in which, whilst the visceral is very complete so as to bring the anus into the line anteriorly or nearly so, the atrophy of the voly left-side organs is not carried out The right t ctenidia, which have now become left and right ively, are of equal size, and are placed symmetrically er side of the neck in the pallial space Related is a simple pair of osphradial patches Both right



Haliotis tuberculata. *d*, foot; *t* tentacle of the mantle (From Owen, after Cuvier)

t nephridia are present, the actual right one being arger than the left. Two auricles may be present nd left of a median ventricle (Haliotis), or only one a). The **Zygobranchia** are further very definitely erized by the archaic character of absence of special ducts. The generative products escape by the nephridium. The sexes are distinct, and there is ulatory or other accessory generative apparatus. eth of the lingual ribbon are highly differentiated doglossate). The visceral dome lies close upon the cker-like foot, and is coextensive with its prolongathe aboral direction.

Zygobranchia comprise three families, arranged in two sub-

Sub-order 1. *Ctenidiobranchia*

rder.—Large paired ctenidia acting as gills

1.—*Haliotidæ.*

a: *Haliotis* (Ear-Shell, Ormer in Guernsey); mostly tropical, *notis.*

2.—*Fissurellidæ.*

a: *Fissurella* (Key-hole Limpet) (figs. 24, 36), *Emarginula.* *rmophorus* (fig. 25); mostly tropical.

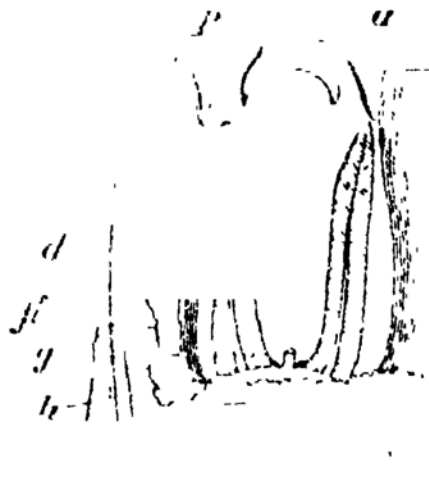
Sub-order 2. *Phyllidiobranchia.*

acters.—Ctenidia reduced to wart-like papillæ; special sub-pallial lamellæ, similar to those of the Opisthobranch phyllidia, perform the function of gills

Family 3.—*Patellidæ.*

Genera. *Patella* (Limpet, figs. 26, &c.), *Nacella* (Bonnet-L *Lottia.*

Further Remarks on Zygobranchia. The Common L is a specially interesting and abundant example remarkable order Zygobranchia A complete and ac account of its anatomy has yet to be written. H have only space for a brief outline. The foot Limpet is a nearly circular disc of muscular tissu



front, projecting from and raised above it, are the head and neck (figs. 26, 30). The visceral hump forms a low conical dome above the rib cordate foot, and standing out all round the base of the dome so as to completely overlap the head and foot, is the circular mantle-skirt. The depth of free mantle-skirt is greatest in front, where the head and neck are covered in by it Upon the surface of the visceral dome, and extending to the edge of the free mantle-skirt, is the conical shell. When the shell is taken away (best effected by immersion in hot water) the surface of the visceral dome is found to be covered by a black coloured epithelium, which may be removed, enabling the observer to note the position of some organs lying below the transparent integument (fig. 27). attaching the foot to the

monstrate the Streptoneurous condition of the viscera
in Zygobranchia.

Thus, then, we find that the Limpet possesses a
metrically-disposed pair of ctenidia in a rudimentary
dition, and justifies its position among Zygobranchia. At the same time it possesses a totally distinct series of *fune tional* gills, which are not derived from the modification of the typical Mollus can ctenidium. These gills are in the form of delicate lamellæ (fig. 26, *f*), which form a series extending com pletely round the inner face of the depending mantle skirt. This circlet of gill lamellæ led Cuvier to cla
Limpets as Cyclobranchiata, and, by erroneous iden
tion of them

University College, Oxford.)

n of the smaller of the two renal organs was deme
ted by Lankester in 1867, at a time when the fa t

that the renal organ of the Mollusca, as a rule, op
the pericardium, and is therefore a typical nep
was not known. Subsequent investigations (27)
under the direction of the same naturalist have shown that the larger as well as the smaller renal sac is in communication with the pericardium. The walls of the renal sacs are deeply plaited and thrown into ridges. Below the surface these walls are excavated with blood-vessels, so that the sac is practically a series of blood vessels covered with renal epithelium, and forming a mesh-work within a space communicating with the exterior. The larger renal sac (remarkably enough, that which is aborted in other Anisopleura) extends between the liver and the integument of the visceral dome very widely. It also bends round the liver as shown in fig. 30, and forms a large sac on half of the upper surface of the muscular mass of the foot. Here it lies close upon the genital body (ovary or testis), and in such intimate relationship with it that, when ripe, the gonad bursts renal sac, and its products are carried to the ex the papilla on the right side of the anus (Rob This fact led Cuvier erroneously to the belief tha existed leading from the gonad to this papill position of the gonad, best seen in the diagr

racters. Streptoneura which, as a sequel to the of the visceral hump, have lost by atrophy the lly left ctenidium and the originally left nephridium, ng the right ctenidium as a comb-like gill plume to nal left of the rectum, and the right nephridium hich is the smaller in the Zygobranchia) also to the left of the rectum, between it and the gill plume. ht olfactory organ only i retained, and may assume n of a comb-like ridge to the actual left of the m or branchial plume. It has been erroneously d as the second gill, and is known as the para a. The rectum itself lies on the animal's right shoulder. The presence of glandular plication of the of the mantle flap (fig. 46, *c*) and an adrectal gland (gland, fig. 47, *gp*) are frequently observed. The se always distinct; a special genital duct (oviduct or duct) unpaired is present, opening either by the side anus or, in the males, on the right side of the neck nexion with a large penis. The shell is usually lar spiral; often an operculum is developed on the upp face of the hinder part of the foot. The dentition lingual ribbon is very varied. In most cases the hump and the foot increase along axes at right an one another, so that the foot is extended far behi visceral hump in the aboral direction, whilst the hump is lofty and spirally twisted.

This is a very large group, and is conveniently into two sections, the Reptantia and the Natantia former, containing the immense majority of the breaks up into three sub-orders, the Holochlamyda monochlamyda, and Siphonochlamyda, characterized presence or absence of a trough-like prolongation margin of the mantle flap, which conducts water respiratory chamber (sub-pallial space where the gil &c., are placed), and notches the mouth of the sh its presence, or again by adaptation to aerial tion. The sub-orders are divided into groups accor the characters of the lingual dentition. In some branchia the mouth is placed at the end of a more elongated snout or rostrum which is not capable of version (Rotifera), in the others (Proboscidifer rostrum is partly invaginated and is often of great It is only everted when the animal is feeding, and i drawn (introverted) by the action of special muscl over-worked term "proboscis" is applied to the re form of snout. The term "introversible snout," or "introvert," would be preferable. The presence or a of this arrangement does not seem to furnish so na division of the Reptant Azygobranchia as that affor the characters of the mantle skirt.

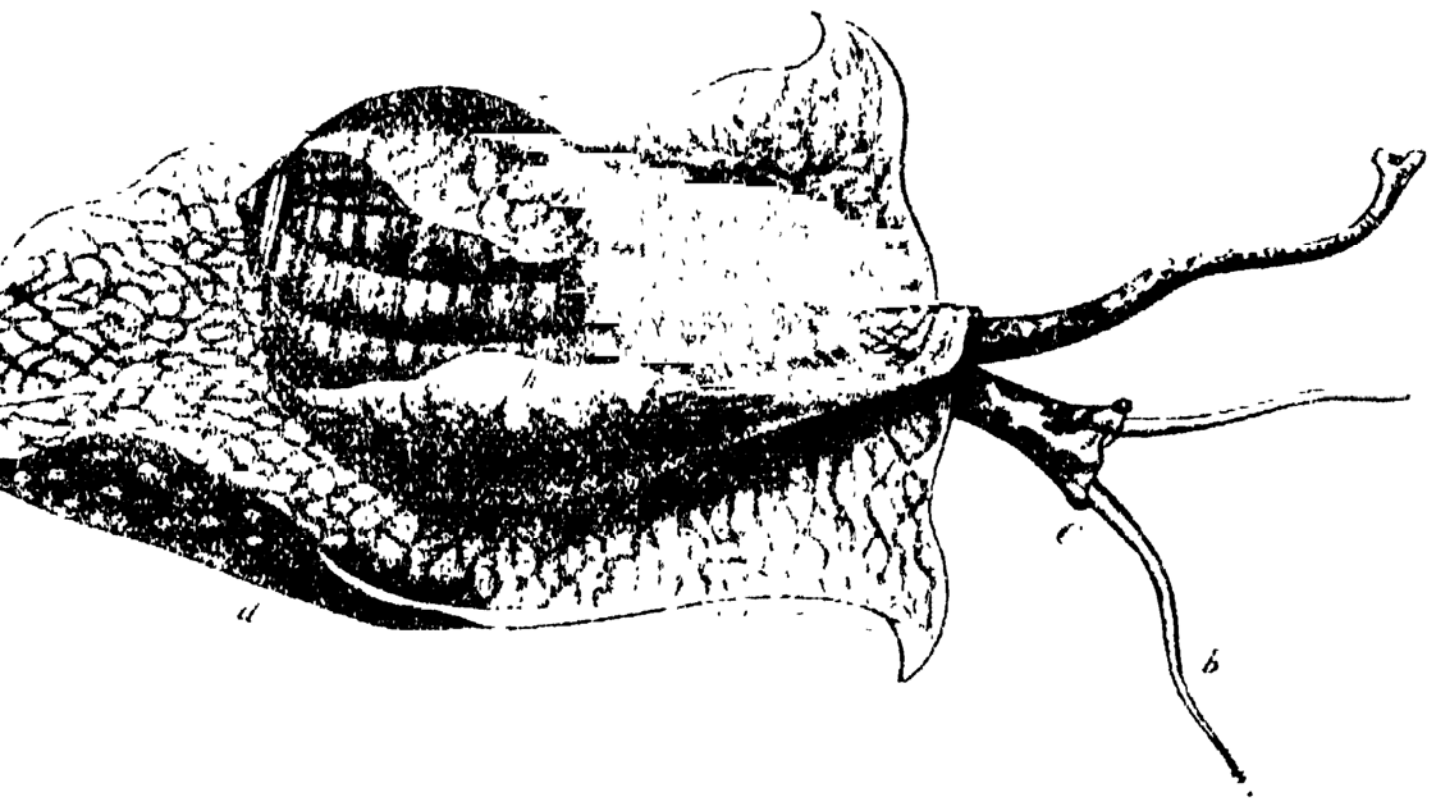
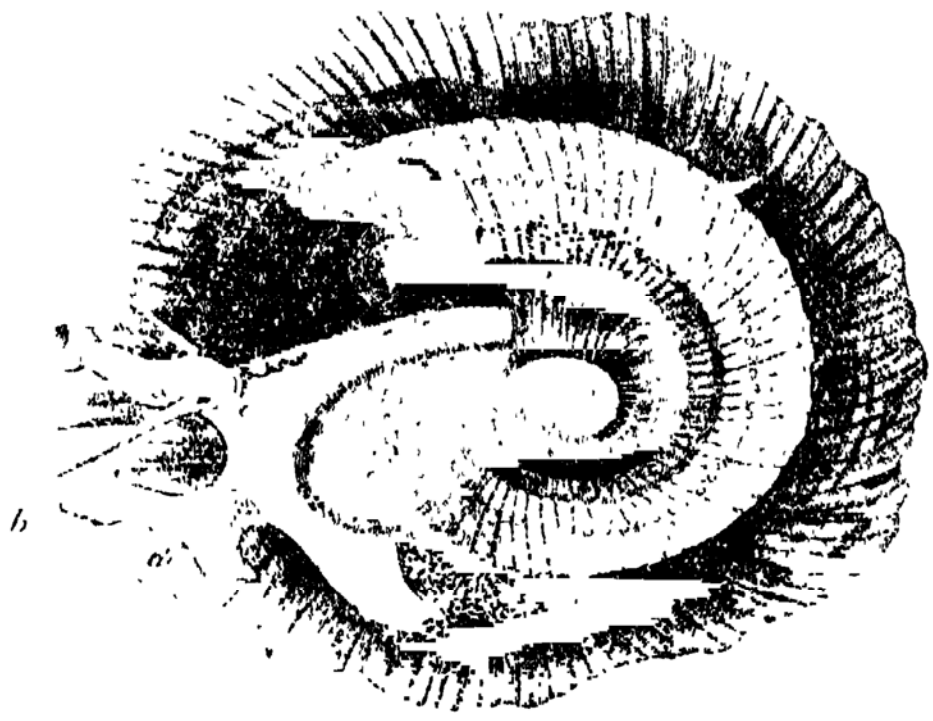
water and some terrestrial forms. The partial dissection of a male specimen of the Common Periwinkle, *Littorina littorea*, drawn in fig. 16, will serve to exhibit the position of viscera which prevails in the group.



Animal and shell of *Lacuna*. [illegible] *a*, head, the letter placed on the side of the foot [illegible] (from Owen

branchial chamber formed by the mantle. But over the head has been exposed by cutting along a line backward from the letters *ol* to the back of the column *lc*, *cc*, and the whole roof of the chamber reflected from the right side of the animal's back has been thrown over to the left, showing the organs which lie on that side. No specimen in the body-cavity has been the ovary, which lies in the coiled visceral hump beneath its transparent walls. The head is seen resting on the foot and carrying a median non-retractile proboscis and a pair of cephalic tentacles, at the base of each of which is an eye. In many Gastropoda the eye is not thus sessile, but is borne on a pedicel or peduncle (fig. 69). To the right of the head is seen the auricular aperture, close to the termination of the vas deferens (*spd*, *ol*). The testis *t* occupies a median position in the dorsal visceral [illegible]. Behind the penis on the same side is the hooklike columella muscle, a development of the



Animal and shell of *Thais scalaris*. *a*, snout (not introversible); *c*, [illegible] *ctn*, right eye; *d*, pro and meso-podium, to the right [illegible] on the metapodium bearing the sculptured operculum.

Of the organs lying on the reflected mantle-skirt, that which in the natural state lay nearest to the vas deferens on the right side of the median line on the roof of the branchial chamber is the rectum *r*, ending in the anus *a*. It can be traced back to the intestine *i* near the surface of the visceral hump, and it is found that the apex of the coil formed by the hump is occupied by the liver *h* and the stomach *s*. The pharynx and œsophagus are concealed in the head. The enlarged glandular structure of the wall of the rectum is frequent in the Azygobranchia, as is also though not universally the gland marked *g*, next to the rectum. It is the adrectal gland, and in the genera Murex and Purpura secretes a colourless liquid which turns purple upon exposure to the atmosphere, and was used by the

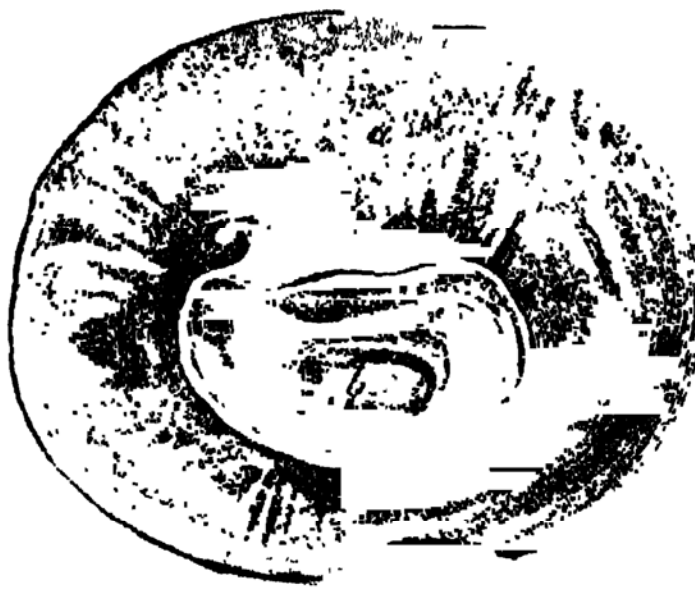


Fig. 40.—Shell of Calyptræa, seen from below so to show the inner whorl *b*, concealed by the c like outer whorl *a*.

ancients as a dye. Near this, and less advanced into the branchial chamber, is the [illegible] renal organ or nephridium *n*, with its opening to the exterior *e*. Internally the glandular sac presents a second slit or aperture which leads into the pericardium (as is now found to be the case in all Mollusca). The heart lying in the pericardium is seen in close proximity

Fig. 46. Mass of [illegible] [illegible] Note the [illegible]

(fig. 139) visceral ganglion

The tenioglossate which are [illegible] branchia are in no [illegible] ently explained by the [illegible] ence attached to [illegible] A an excellent general type of the nervous system, attention may be directed to that of Paludina drawn in fig. 21. On the whole, the ganglia are [illegible] decided in the Azygobranchia, nerve cell tissue being concentrated in the ganglia and absent from the cords (contrast with Zygobranchia and Lipobranchia). At the same time, the junction of the visceral loop above the intestine prevents in all Streptoneura the shortening of the visceral loop, and it is rare to find a fusion of ganglia with either pleural, pedal, or cerebral, which can and does take place where the visceral loop is not above but below the intestine, *e.g.* in the Euthyneura (fig. 67), Cephalopoda (fig. [illegible]), and Lamellibranchia (fig. [illegible]). As contrasted with the Zygobranchia and the Lipobranchia, we find that in the Azygobranchia the pedal nerves are distinctly nerve-cords apart from the pedal ganglia, rather than cord-like nerve tracts containing both nerve cells and nerve fibres. Yet in some Azygobranchia (such as Chiton) the [illegible] of the two [illegible] nerve-cords. The [illegible] branchia has been detected (30). The histology of the nervous system of Mollusca has yet to be carefully inquired into.

The alimentary canal of the Azygobranchia [illegible] little diversity of character, except in so far as the [illegible] region is concerned. Salivary glands are present, and some carnivorous forms (Dolium) the [illegible] secrete [illegible]

which is also the condition presented by the mouth
region in nearly all other Gastropoda. One of the
amples of the introversible mouth-cylinder or pr
which can be found is that of the Common Whelk
immediate allies. In fig. 37 the proboscis is seen
everted state; it is only so carried when feeding,
withdrawn when the animal is at rest. Probably
is to enable the animal to introduce its rasping
king apparatus into very narrow apertures for the
of feeding, *e.g.*, into a small hole bored in the bod
her Mollusc
foot of the Azygobranchia, unlike the simple con
ise of the Isopleura and Zygobranchia often
into lobes, a fore, middle, and hind lobe epip
and meta podium, see figs. 39 and 140. Very usually
universally, the meta podium carries an operculum.
sion of the foot into lobes is a simple case of the
reater elaboration or breaking up into processes and
which it undergoes in the class Cephalopoda. Even
some Gastropoda (viz., the Opisthobranchia) we
e lobation of the foot still further carried [illegible]
ly Azygobranchia, on the other hand, in which the
s a simple oblong form without any trace of lobe
development of the Azygobranchia from the
llowed in several examples, *e.g.*, Paludina, Fissurella,
Vermetus, Neritina. Another Mollusc [illegible]
a wide variation in the early processes of the forma
the first embryonic cells, and their arrangement
stula dependent on the [illegible] of
lk which is present in the egg-cell when it enters
its embryonic changes. In fig. 7, the egg's [illegible]
ulana riuipara are represented. There is little
the food material in the egg of the Azygobranch
nsequently the Diblastula forms by invagination
stopore or orifice of invagination with the
nd never closes entirely. A well-marked Trochosphere
is formed by the development of an equatorial
band, and subsequently, by the disproportionate
of the lower hemisphere, the Trochosphere becomes
ger. The primitive shell-sac or shell-gland is well
l at this stage, and the pharynx is [illegible] a new
th (the stomodæum, about to fuse with and open
e primitively invaginated archenteron (fig. 7 F).
ther Azygobranchs (and such variation is repre
ve for all Mollusca, and not characteristic only of
branchia), we find that there is a very unequal
n of the egg-cell at the commencement of embryonic
oment, as in Nassa (fig. 5). Consequently there is
speaking no invagination (emboly), but an overg
(epiboly) of the smaller cells to enclose the larger
neral features of this process and of the relation of
astopore to mouth and anus have been explained
n treating of the development of Mollusca generally
n cases the blastopore may entirely close and both
and anus develop as new outgrowths (stomodæum
ectodæum), whilst, according to the observations of
zky, the closed blastopore may coincide in position
e mouth in some instances (Nassa, &c.), instead of
e anus. But in these epibolic forms, just as in the
e Paludina, the embryo proceeds to develop its [illegible]
nd and shell-gland, passing through the earlier con
of a Trochosphere to that of the Veliger. In the
stage many Azygobranchia (Purpura, Nassa, &c.)
, in the dorsal region behind the head, a contractile
f the body wall. This acts as a larval heart, but
to pulsate after a time. Similar rhythmically con
e areas are found on the foot of the embryo Pulmo
Limax and on the yolk-sac (distended foot-surface)
Cephalopod Loligo (see fig. 72**).

The history of the shell in the development of
branchia (and other Gastropods) is important
the primitive shell-sac aborts and gives place to a
or boat-like shell, so in some cases (Marsenia, Kro
this first shell has been observed to be shed, and a second
of different shape is formed beneath it.

A detailed treatment of what is known of the
connexion in relation to the cell-layers in the Mollusca
takes us far beyond the limits of the article which
exposing only the well-ascertained characters in
of the Mollusca and the various [illegible]
will suffice to give an accurate knowledge of the d
ment of the Gastropoda, a type for all characters of

ranch *b.* — *EUTHYNEURA* (Spengel, 1881).

racters. — Gastropoda Anisopleura in which the l loop (the contermmous visceral nerves) does not n the torsion of the visceral hump, but, being sunk y below the body wall, remains straight and un l. Although the anus is not brought so far forward

Bulla ventricosa (Chemnitz), as see thys, fig. 67, B), possibly a continu s. (From Owen.)

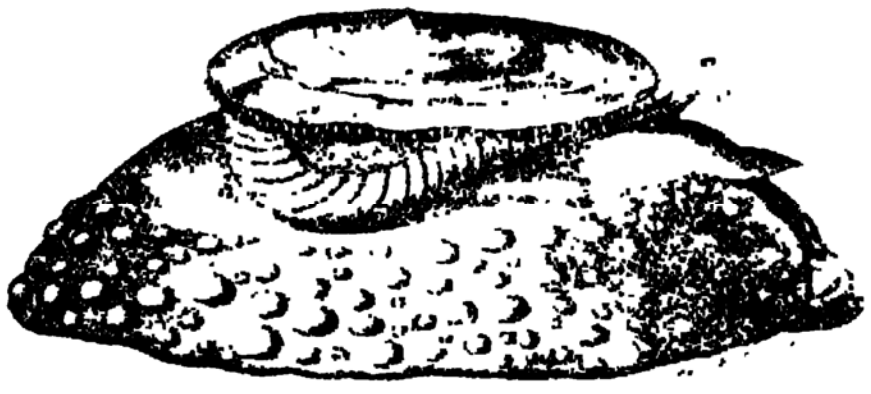
visceral torsion as in the Streptoneura, and may even *dary* growth assume a po-terior median position, yet, y developed, an asymmetry has resulted as in the branchia, only the original right renal organ right ium (if any), right osphradium right auricle of the heart ght genital ducts being retained. All the Euthyneura are hermaphrodite. The lingual ribbon has very numerous fine denticles rentiated into series in ow. The shell is light tle calcified; often it is developed in the adult, present in the embryo. ereulum, often found in lbryo, is never present in ult (except in Tornatella,). Many Euthyneura show a tendency to, or a te accomplishment of, the suppression of the mantle s well as of the shell, also of the etenidium, and at the same time a more or less cylindrical (slug-like) f body.

Fig. 5. — Tornatella. *h*, shell; *a*, mouth; *f*, foot; *o*, operculum.

Euthyneura comprise two orders, the Opisthobranchia and the Pulmonata.

Order 1.—Opisthobranchia

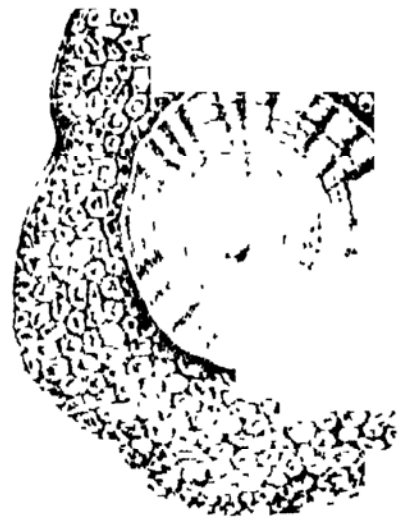
ine Euthyneura the more archaic forms of which relatively large foot and a small visceral hump, the base of which projects on the right side a short e-skirt. The anus is placed in such forms far back



—*Umbrella mediterranea*. *a*, mouth; *b*, [illegible] dium). The free edge of the mantle is seen to ell (compare with Aplysia, fig. 63). (From Ow

d the mantle-skirt. In front of the anus, and only lly covered by the mantle skirt, is the etenidium with o end turned backwards. The heart lies in front of, l of to the side of, the attachment of the etenidium. ee Opisthobranchia as opposed to "Prosobranchia,"

which correspond to the Streptoneura. A shell is pos in the adult state by but few Opisthobranchia, but a through a veliger larval stage with a nautiloid shell (fi



Many Opisthobranchia have by a process of atrophy lost the typical etenidium and the mantle-skirt, and have deve loped other organs in their place. As in some Azygobranchia, the free margin of the mantle-skirt is frequently reflected over the shell when a shell exists, and as in some Azygobranchia, broad lateral outgrowths of the foot (epipodia) are often developed which, as does not occur in Azygobranchia, may be thrown over the shell or naked dorsal surface of the body.

The variety of general development of structure accompanying the atrophy of typical organs and general degeneration of organization renders the classification of this order may be determined Mollusc-can mantle-cavity (branchial shed, and with each section

The development of Aplysia from the egg present
points of interest from point of view of comp
embryology but in relation to the morphology
Opisthobranchs it is sufficient to point to the occ
of a trochosphere and a veliger stage (fig. 60), an
shell gland or primitive shell sac (fig. 68, *shs*), which
ceeded by a nautiloid shell.

The nervous system of Aplysia will be found c
parison on fig. 70, which represents it, with our sel
Mollusc (fig. 1, D) to present but little modification
in fact a nervous system in which the great ganglia
are well developed and distinct. The Euthyneurous
loop is long, and presents only one ganglion (in
cumulus, but two distinct ganglia joined to one and

hybrida of the English coast), placed at its extreme
epresenting both the right and left visceral ganglia
e third or abdominal ganglion, which are so often
ely present. The diagram (fig. 20) shows the nerve
ing this abdomino-
l ganglion with the

e great development of the epipodia seen in Aplysia
ual in Palliate Opisthobranchs, it occurs also in Dyn
62, D) among Non-Palliata; in Doris it seems probable
that the mantle-like fold overhanging the foot is to
terpreted as epipodium, the mantle skirt being also
r absent, as shown by the naked position of the gill
ums on the dorsal surface (fig. 61 and 62, C). The
e surface of the body becomes greatly modified in
Non-Palliate forms which have lost, not only the
le-skirt and the shell, but also the etenidium. Many
ese (Ceratonota) have peculiar processes developed
he dorsal surface (fig. 62, A, B), or retain purely
negative characters (fig. 62, D). The chief modifica
internal organization presented by these forms, as com
with Aplysia, is found in the condition of the alim
canal. The liver is no longer a compact organ op
by a pair of ducts into the median digestive tract, b
find very numerous hepatic diverticula on a sho
axial tract (fig. 66). These diverticula extend usual
into each of the dorsal papillæ or 'cerata' when the
present. They are not merely digestive glands, b
sufficiently wide to act as receptacles of food, and in
the digestion of food proceeds partly in the axial p
similar modification of th
or great dorsal gland is found in the Scorpions,
the axial portion of the digestive canal is short and st
and the lateral ducts unusually wide to admit fo
the communication of the gland there to be direct,
as in the Spider the gland is confined to a series of
ducts.

The typical character is retained by the heart
ventricle, and the communication of pericardium and renal
in all Opisthobranchs. Amongst the Nudibranchs, for example, the
branchia by the fish-like transparent Phyllirhoe (fig.

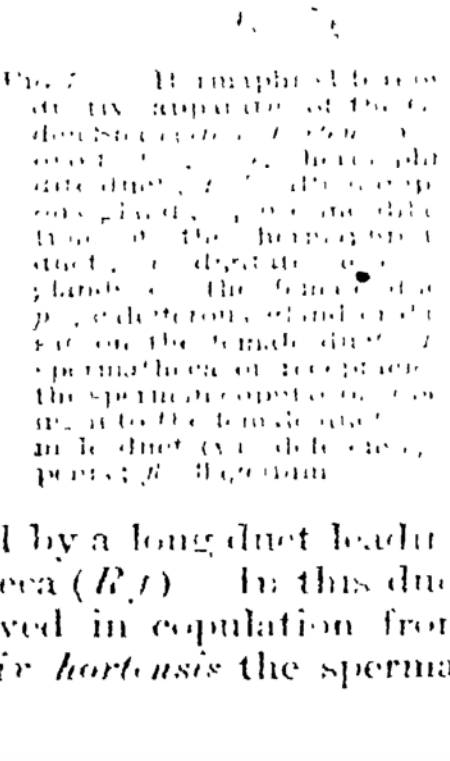
same general range of body form is shown in Pul as in the Natant Azygobranchia and in the Opis- nchia: at one extreme we have Snails with coiled hump, at the other cylindrical or flattened Slugs 69). Limpet like forms are also (fig. 71, Ancylus). The foot is al mple, with its flat crawling surface ng from end to end, but in the Limnæus (fig. 4, H) it shows a character, which leads on to the on characteristic of Pteropoda. adaptation of the Pulmonata to fr life has entailed little modification interna l organization. The vascular s more complete in them than in other G ssels and even capillaries being present , in which arteries and veins find their The subject has not, however, been r proper methods of recent histology and

f it, as of the vascular system of Moll t unsatisfactory. In one genus (H of the blood is coloured red by he only instance of the pre s f this body in the blood of phorous Mollusca, though it in corpuscles in the blood bivalves Area and Solen ster, **31**).

generative apparatus of the Helix may serve as an ex of the hermaphrodite appa common to the Pulmonata Opisthobranchia (fig. 72) the ovo-testis, which lie e apex of the visceral coil, mon hermaphrodite duct *e.d* ds, which receives the duct compact white albuminif gland *E.d.*, and then be much enlarged, the additi width being due to the pment of glandular folds, are regarded as forming a *u*. Where these folds cease mmon duct splits into two s, a male and a female ale duct *e.d* becomes fleshy uscular near its termination genital pore, forming the . Attached to it is a diver *fl.*, in which the sperma- which have descended from o-testis are stored and mo into sperm ropes or sperma es. The female portion of uct is more complex. Soon quitting the uterus it is joined by a long duct leadi a glandular sac, the spermatheca (*R.f*). In this duct ae the spermatophores received in copulation from r snail are lodged. In *Helix hortensis* the sperma-



theca is simple. In other species of Helix a secon (as large in *Helix aspersa* as the chief one) is given o the spermathecal duct, and in the natural state is adherent to the wall of the uterus. Thus second d normally no spermathecal gland at its termination, is simple and blunt. But in rare cases in *Helix a* second spermatheca is found at the end of the secon Tracing the widening female duct onward we now to the open ... duct there are accessory glands *d, d,* ... junction of the oviduct the ... a thick walle ... adhere to the fluted rod ... of lime is found. sted for a brief period.
n Clausilia, according to the observations of Gegenbaur,
primitive shell sac does not flatten out and disappear,
takes the form of a flattened closed sac. Within this
ed sac a plate of calcareous matter is developed, and
r a time the upper wall of the sac disappears, and the
areous plate continues to grow as the nucleus of the
manent shell. In the lung Testacella (fig. 69, C) the
ll plate never attains a large size, though naked. In
o lungs, namely, Limax and Arion, the shell sac remains
nparently closed over the shell plate, which in the latter
ers another more or less calcareous line
permanent primitive shell sac in these lungs is
ount of considerable interest. It is clear enough that
sac is not a differentiation from that of Aplysia (described
the section on the Opisthobranchia), being primitive
ead of secondary. It seems probable that a rudimental
h one of the openings in which each shell plate of a
ation is formed, and the cuticular plate like imbrication
ich are placed behind the mouth, which are on the dorsum
the curious lung Pneumophorus, next to the peculiarity
the formation of a series of shell sacs on the back of
t animal similar to the shell we find in Chiton
ether the closed primary shell sac of the adult (and
h at the transient embryonic shell gland of all other
llusca) gives rise in the same manner to the closed sac in
ich the calcareous portion or shell of the Cephalopod Sepia

The development of the aquatic Pulmonata fr
egg offers considerable facilities for study, and
Limnæus has been elucidated by Lankester, while
has with remarkable skill applied the method of
to the study of the minute embryos of Planorbis
chief features in the development of Limnæus are ex
in the woodcuts (figs. 3, 4, and 72***). There is
very large amount of food material present in the
this snail, and accordingly the cells resulting from
are not so unequal as in many other cases. The fo
first formed are of equal size, and then four smal
are formed by division of these four so as to
one end of the first four (the pole correspon
that at which the "directive corpuscles" *d* are e
and remain). The smaller cells now divide and
over the four larger cells (fig. 3); at the same time

canal etc. (see also the account and figures (fig. 15
the development of the bivalve Pisidium), altho
endoderm cells retain no contact with the middle
of the now closed up blastopore. The anal openin
at a late period by a very short ingrowth or proc
coinciding with the blind termination of the rectal
(fig. 72***, *pp*).

The body cavity and the muscular, fibrous, and
tissues are traced partly to two symmetrically-

lasts," which bud off from the invaginated arch-, partly to cells derived from the ectoderm, which ry early stage is connected by long processes with aginated endoderm, as shown in fig. 3, D. The ex form of the embryo goes through the same changes ther Gastropods, and is not, as was held previously xester's observations, exceptional. When the middle nder regions of the blastopore are closing in, an ial ridge of ciliated cells is formed, converting the into a typical "Trochosphere" (fig. 4, E, F).

foot now protrudes below the mouth (fig. 4), and the al hemisphere of the Trocho-phere grows more rapidly e anterior or velar area. The young foot shows a form (fig. 4, D, *f*). Within the velar area the eye cephalic tentacles commence to rise up (fig. 4, D, the surface of the post-oral region is formed a cap ell and an encircling ridge, which gradually increases inence and becomes the freely depending mantle The outline of the velar area becomes distinctly nated and can be traced through the more mature s to the cephalic lobes or labial processes of the Limnæus (fig. 70).

permanence of the distinction of the part known velar area through embryonic life to the adult is exceptional among Molluscs, and is therefore a point of l interest in Limnæus. None of the figures of Limnæus in recent works on Zoology show properly n of the head and these velar lobes, and accordingly ures here given have been specially described for the article. The increase of the ventral disc, its twisting, and the gradual closure of the space over by the mantle-skirt so as to convert it into a sac with small contractile aperture, belong to stages in the pment later than any represented in our figures.

may now revert briefly to the internal organization eriod when the Trochosphere is becoming to show a nt foot growing out from the area which is the mid of the elongated blastopore which is situated, and having ore at one end of it the mouth and at the other the Fig. 72*** represents such an embryo under a light ession as seen by transmitted light. The ciliated of the left side of the velar area is indicated by a tending from *v* to *v*; the foot *f* is seen between the nx *ph* and the pedicle of invagination *pe*. The ma arch enteron or invaginated endodermal sac has on a bilobed form (compare Planorbis, fig. 15 *b*), and s are swollen (*gs* and *lyc*). This bilobed sac becomes y the liver in the adult; the mid-gut and stomach rmed from the pedicle of invagination, whilst the nx, œsophagus, and crop form from the stomodæal nation *ph*. To the right (in the figure) of the pedunele is seen the deeply invaginated shell gland h a secretion *sh* protruding from it. The shell gland tined in Limnæus to become very rapidly stretched nd to disappear. Farther up, within the velar area, diments of the cerebral nerve ganglia *ne* are seen ting from the ectoderm. A remarkable coiled cell g a position just below the integument on each f the head. In the figure the coil of the left side marked *re*. This paired organ consists of a string of which are perforated by a duct. The opening of the at either end is not known. Such canalized cell aracteristic of the nephridia of many worms, and it that the organs thus formed in the embryo Limnæus mbryonic nephridia. The most important fact about is that they disappear, and are in no way connected the typical nephridium of the adult. In reference ir first observer they are conveniently called "Stiede's." Other Pulmonata possess, when embryos, Stiede's in a more fully-developed state, for instance, the common slug Limax (fig. 72**, *pk*). Here too they d pear during embryonic life. Further knowledge con ing them is greatly needed. It is not clear whether is anything equivalent to them in the embryos of m Gastropoda or other Mollusca, the ectodermal cells "embryonic renal organs" in some Gastropod embryos ing only a remote resemblance to them. The three of transient embryonic nephridia of the mesodermal the ciliated cephalic pits of Nemertine, and the ant nephridia of Cephyrean, all suggest themselves for parison with the segmental canal.

Water Pulmonata. Whilst the Pulmonata are truly a terrestrial and not a water group, there are many of the Pulmonata which frequent the ers (Pereira, fig. 72), whilst there are numerous ecies (Limnæa, Planorbis) found in more or less fresh water per (33) has shown that these have no additio the normal pair of cephalic eyes, a number of eyes develo upon the dorsal mantle-tract. These eyes are perfect in children, possessing lens, retina, optic nerve cerebral ganglion, and optic nerve. Correctly en however, they differ from the cephalic Molluscan eye an account of which see the Ilead, in the fact that, the vertebrate eye, the fibres of the optic nerve te the retina, but are connected with the rods and nerve cells near the base instead of with the opp end. The importance of this arrangement is not kn but it is important to note, as shown by Hensen, Hes and others, that in the Lamellibranch Pecten and Spond which also have eyes upon the mantle-tract, distinct cephalic eyes are absent. The nerve relationships Onchidium of the optic nerve to the retinal elements the In both Onchidium and Pecten the pedal eyes have probably been developed by the modification of tentacles a curious and modified form with the eyes Onchidium are, according to Semper, protected by the hooked tip of the Peroephthalmus, and are of a special value to them in order to from this enemy.

and meta-podium of Gastropoda. The fore-foot inv… hy… the HEAD MERGED into it, and grows up on ea… (right and left) of that part so as to surround the … the two upgrowths of the fore-foot meeting on the … aspect of the snout, whence the name Cephalopod… the more typical forms of both branches of the cl… peri-oral portion of the foot is drawn out into paire…

ocesses, either very short and conical (Clio, Eurybia), hy (Pneumodermon, Octopus); these may be beset ckers or hooks, or both. The mid foot (fig. 75, *mf*) nded into a pair of muscular lobes right and left, ither are used for striking the water like the wings tterfly (Pteropoda), or are bent round towards one so that their free margins meet and constitute a be, - the siphon or funnel (Siphonopoda). The hind ither very small or absent.

stinctive feature of the Cephalopoda is the ABSENCE hing like the TORSION of the VISCERAL MASS in isopleurous Gastropoda, although as an exception rsion occurs in one family (the Limacinidæ).

ANS, although it may be a little displaced from han line, is (except in Limacinidæ) approximately and posterior. The MANTLE-EDGE may be aborted osomatous Pteropoda); when present it is deeply d posteriorly, forming a large subpallial chamber the arms. As in our schematic Mollusc (fig. 75), the ad arms are placed the simple or paired apertures of the DIA, the GENITAL APERTURE (paired only in Nau female Octopoda, female Onchidium, etc.), the e), and the paired TENTACLES on head (A SCERAL HUMP or dome is elevated and m elongated (see fig. 75, *vh*), forming a at right angles to the primary body-axis 75) of the foot.

HELL is frequently, but not invariably, sceral hump and mantle-skirt of Cephalo are both Pteropoda and Siphonopoda. The shell is usually highly differentiated, chambers in correlation with the free activity of the Cephalopoda. It may be e or boat like, or internal, when it is ons minute pigmented sacs (*pigment-spots* or *eyes*) near tion, and known as CHROMATOPHORES, are found t in the integument in both branches of the cla s of both sexes are developed in one molluscoid lopoda (Pteropoda), in other the sexes are separat ST ORGANS, especially the cephalic eyes and the oto are very highly developed in the higher Cephalopoda. sphradia have the typical form and position in the forms, but appear to be more or less completely d by other olfactory organs in the higher. The L NERVE GANGLIA are present, but the connectives ned, and the ganglia concentrated and fused in the ic region. Large specialized ganglia (optic, stellate, a bneeal) are developed in the higher forms (Siphon

Cephalopoda exhibit a greater range from low to rganization than any other Mollusc class, and hence re difficult to characterize in regard to several group ans; but they are definitely held together by the ce in all of the encroachment of the fore foot on a round the head, and by the functionally important ATION OF THE MID-FOOT.

ens organs are highly developed; the eye exhibits a special elaboration of structure in the Dibranchiata, a remarkable archaic form in the Nautilus. Otocysts present in all. The typical osphradium is not present,

pt in Nautilus, but other organs are present in

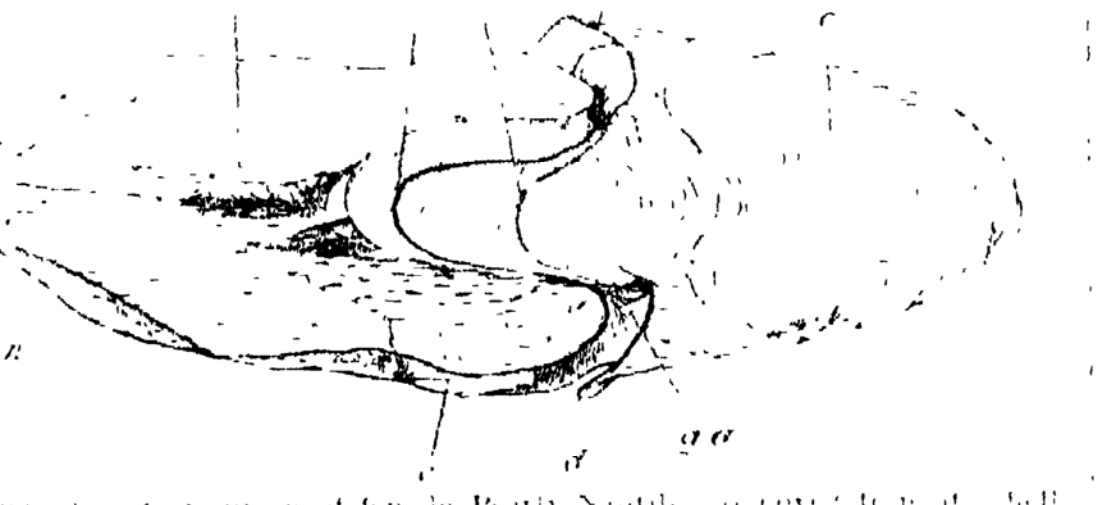
term hectocotylization is applied to this modificatio figs. 88, 95, 96). Elaborate spermatophores or sperm are formed by all Siphonopoda, and very usually the possesses special capsule-forming and nidamental glan providing envelopes to the eggs (fig. 101). The egg of all Siphonopoda is large, a development is much modified by the pr of an excessive amount of food-material d in the protoplasm of the egg cell. Troch and veliger stages of development are quently not recognizable.

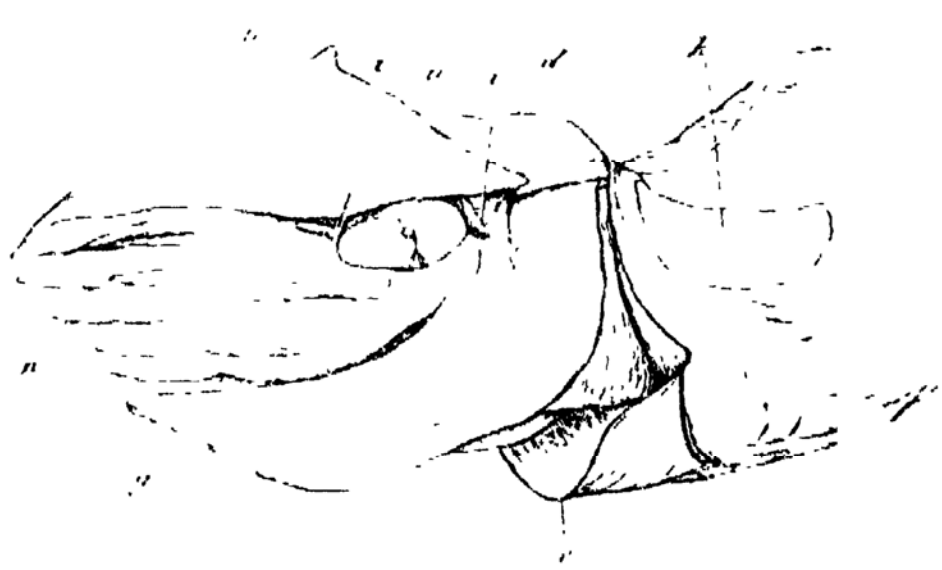
The Siphonopoda are divisible int orders, the names of which (due to Owe scribe the number of gill-plumes presen in fact there are several characters of a importance as those derived from the g which the members of these two or de created from one another.

Order I. **Tetrabranchiata** (Schizosi Tentaculifera).

Characters.—Siphonopodous. Cepha in which the inrolled lateral margins mid-foot are not fused, but form a sipl apparatus (fig. 101). The circumoral of the fore-foot carry numerous sheath tacle-protruders) (fig. 88). There a pairs of ctenidial gills (hence Tetrabranc and two pairs of nephridia, consequent nephridial apertures (fig. 101). The pericardial chamber opens by two indep apertures to the exterior and not in nephridial sacs. There are two o (right and left) in the female and two duct in the male, the left duct i sexes being rudimentary.

A large external shell either coiled or s present, and is not enclosed by reflex the mantle-fold, except such narrow-mouthed sh that of Gomphoceras, which were probably enclosed





ngitudinal section of female Pearly Nautilus (reduced to about half). The shell has been removed and a part of the outer mantle-fold has been cut away in order to show the gill-plumes attached to the roof of the mantle-cavity. On the left side of the head of each are seen the two pairs of tentacles, and on the right side the hood or dorsal portion of the funnel has been removed. The body is supported by the shell and retracted into it by the strong columellar muscle, which has been cut across. The mouth is seen in the floor of the buccal cavity, and the anus and renal papilla on each side of it. The genital papilla is seen in the floor of the mantle-cavity, behind the base of the left gill-plume. The ventral edge of the mantle-fold is seen to be produced into a funnel, which has been cut across. The shell is seen to consist of a series of chambers, the last of which is occupied by the body of the animal, the hinder ones being filled with gas. The suture-line between the septa and the shell-wall is seen on the right side.

Longitudinal section of the same specimen as that drawn in fig. 90 (reduced to about half). *a*, the conical body-whorl; *b*, the last-formed chamber; *c*, the siphuncle; *d*, the funnel; *e*, the mantle-fold; *f*, the nuchal tentacle; *g*, the eye; *h*, the olfactory organ; *i*, the gill-plumes; *k*, the anus; *l*, the renal papilla; *m*, the genital papilla; *n*, the hood; *o*, the mouth; *p*, the buccal cavity; *q*, the radula; *r*, the odontophore; *s*, the tongue; *t*, the buccal tentacle; *u*, the lip; *v*, the fore-foot; *w*, the mid-foot; *x*, the hind-foot; *y*, the operculum; *z*, the shell-wall; *a*, the septa

Further Remarks on the Cephalopoda. In order
a more precise conception of the organization of the C
poda in a concrete form we select the Pearly Naut
further description, and in passing it structure in review we shall take the opportunity of comparing here and there the peculiarities presented by that animal with those obtaining in allied forms. In the last edition of the work the Pearly Nautilus was made the subject of a detailed exposition by Professor Owen, and it has seemed accordingly appropriate that it should be somewhat fully treated on the present occasion also. The figures which illustrate the present description are (excepting fig. 89) original, and prepared from dissections (made under the direction of the writer) of a male and female *Nautilus pompilius*, lately purchased for the Museum of University College, London.

Visceral Hump and Shell.—The visceral hump of Nautilus (if we exclude from consideration the fine, siphuncular pedicle which it trails, as it were, behind it) is very little if at all affected by the coiled form of the shell which it carries, since the animal always slips forward in the shell as it grows, and inhabits a chamber which is practically cylindrical (fig. 89). Were the deserted chambers thrown off of being accumulated behind the inhabited chamb coiled series of air chambers, we should have a more indication in the shell of the extent and form of the a

Amongst Gastropods it is not very unusual to find
imal slipping forward in its shell as growth advances
ving an unoccupied chamber in the apex of the shell.

nbers may be used as a hydrostatic apparatus, and
ation to this use, if any, of the siphuncular pedicle,
lved in obscurity, and is the subject of much in
s speculation. In connexion with the secretion of
the animal, besides the parallel cases ranging from
otozoon Arcella to the Physoclistic Fishes, from
ydroid Siphonophora to the insect larva Oestrus,
e the identical phenomenon observed in the lowly
Sepia when recently hatched. Here, in the pores
internal rudimentary shell, gas is observable, which
essarily been liberated by the tissues which secrete

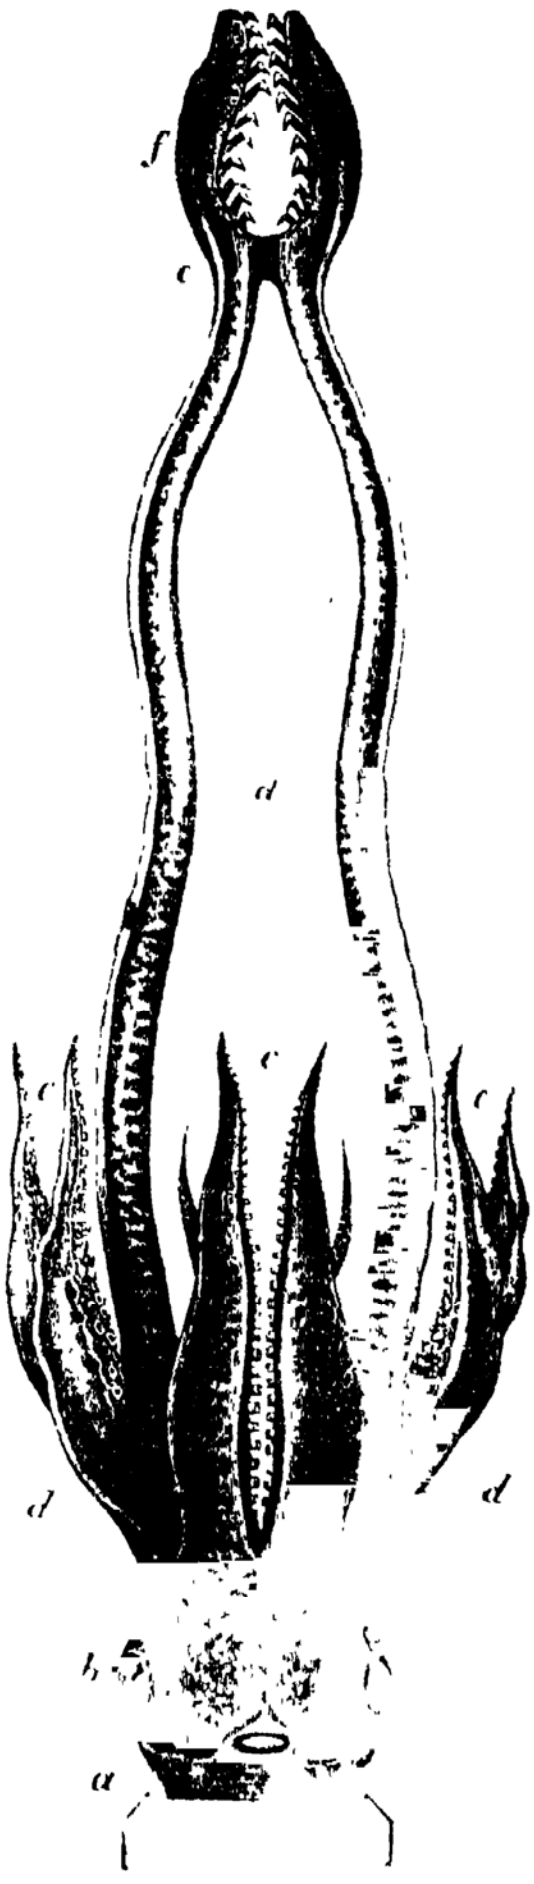

FIG. 97. Head and [illegible] processes of the [illegible] of Octopus [illegible] (from Owen). [illegible] the eight [illegible] pedunculate [illegible] the [illegible] [illegible] of which are provided with [illegible] and with a double row of hooks beyond [illegible]. The [illegible] by contraction of the [illegible] to act in concert.

the shell, and not derived from any external
(Huxley).

The coiled shell of Nautilus, and by analogy that
Ammonites, is peculiar in its relation to the body
animal, inasmuch as the curvature of the coil pro

[illegible]

[illegible] from the centro dorsal area is towards the head on f
instead of away from the head and backwards as
discoid coiled shells such as Planorbis the coil is
absolutely reversed in the two cases. Amongst the
allies of the Nautilus (Tetrabranchiata) we find shells
of a variety of forms,
shapes, open coiled
such as Scaphites,
leading on to perfectly cylindrical
shells with chambers
succeeding each other in a straight
line (Orthoceras),
whence again we
may pass to the
cork screw spire
formed by the shell
of Turrilites.

[illegible]

Whilst the Tetrabranchiata [illegible]
we can see in
their remains [illegible]
characterized by
these large chambered shells, which, as in Nautilus
with the exception of some narrow mouthed forms
(Gomphoceras), but very partially covered by
of the mantle (fig. 89, b), the Dibranchiata
an interesting series of gradations in which we
(a) the diminution in relative size of the
shell; (b) its complete investiture by reflected
the mantle (Spirula, fig. 100, D); (c) the

foids of the mantle to form a definitely-closed
(*d*) the secretion by these mantle-folds or walls
shell as of additional laminæ of calcareous shell-
, which invest the original shell and completely
appearance (Spirulirostra, fig. 100, C; Belemnites),
gradual dwindling and total disappearance of the
branchiate shell, and survival alone of the calcare-
deposited by the inner walls of the sac (Sepia,
(*e*) the disappearance of all calcareous sub-
ben the coni or plate which now represents the
of the shell sac, and its persistence as a horny
mandix (Loligo, fig. 99); (*e*) the total disappearance
both shell and consequently of the pen or plate,
ules the rudiment of the shell sac appearing in
larvæ and then evanescing (Octopus). The early
sac at the base of the mantle in which the shell is
in Dibranchiata, has led to an erroneous identifi-
of the sac with the primitive shell sac of the archi-
(fig. 1) or Chiton (fig. 10, A), or Arion (fig. 69
ated of the normally developing Mollusc an embryo
s and 7, *sh*). The late appearance of the shell
Dibranchiata is seen in fig. 124 and 125, it forms
ary outgrowth of the continuous dorsal area of the
having been demonstrated by Lankester (**34**) in
who subsequently showed (**35**) that the same hollow-sac
and disappears without closing up in Argonauta
topus and pointed out the discrepancies of the sac
primitive shell-gland. The shell of the female
nautilus is not formed by the visceral hump but by the
d lobes of the foot, which are in life always closely
d to it.

adhering to the Pteropoda we have shell (the Thecosomata
exceedingly light, and fits close to the animal, no
mantle being formed. It is important to note that
development of the Cephalopoda there is the same tend-
which is exhibited in the Dibranchiate Siphonata
for the mantle-skirt to be reflected over and closely
d to the head (e.g. Cuvolinia, figs. 79 and 80). But
opoda there is no complete formation of a closed
the reflected mantle, no thickening of the enclosed
no disunion of the original shell and substitution
of a laminated plate. The various forms of torm of
the shell of Pteropoda are peculiarity of that

Shell, Hood, Mantle-skirt, and Sub-pallial Chamber. In
arly Nautilus the dorsal visceral hump is completely
d by the free flap of integument known as mantle-
fig. 91, *d, cf*). In the anterodorsal region this flap
ased so as to be reflected a little over the coil of the
which rests on it. In the posteroventral region the
is deepest, forming an extensive sub-pallial chamber,
entrance of which is placed in fig. 91. A view of
oor of the sub-pallial chamber as seen when the
skirt is retroverted and the observer face to face
is indicated by the reference line passing from *c* in
, as shown in fig. 101. With this should be com-
the dorsal view of the sub-pallial chamber of the
female (seen in fig. 103). It should be noted as a
ce between Nautilus and the Dibranchiate that in
rmer the rudimental gland (in the female) lies on
rface of the pallial chamber formed by the dependent
flap (fig. 101 *cf*, 89, F) whilst in the latter it lies
e surface formed by the body-wall, in fact in the
the base of the loose fold forming the mantle skirt com-
in, as a part of what is termed visceral
in the latter.

apertures of the two pair of nephridia, of the vis-
ericardial sac, of the genital duct, and of the anus

duct (*nephridial sac* of Owen). Other letters as in fig. 101.

tures, viz., the median anus with adjacent orifice
ink-sac, the single pair of nephridial apertures, a
asymmetrical genital aperture (on the left side), ex
female Octopoda and a few others where the
ducts and their apertures are paired. No visce
cardial pores are present on the surface of the
chamber, since in the Dibranchiata the viscero-per

opens by a pore into each nephridium instead of
tly to the surface. A single pair of ctenidia (gill
nes) is present instead of the two pairs in Nautilus.
existence of two pairs of ctenidia and of two pairs
ephridia in Nautilus, placed one behind the other, is
ly remarkable. The interest of this arrangement is in
ion to the general morphology of the Mollusca, for
impossible to view this repetition of organs in a linear
s as anything else than an instance of metamere segmen-
tation, comparable to the segmentation of the ringed
ms and Arthropods. The only other example which
ave of this metamerism in the Mollusca is presented
he Chitons. There we find not two pairs of ctenidia
ly, but sixteen pairs (in some species more) accom-

ied by a similar metamerism of the dorsal integument,
ch carries eight shells. In Chiton the nephridia are
affected by the metamerism as they are in Nautilus
s impossible on the present occasion to discuss in the
which their importance demands the significance of
e two instances among Mollusca of incomplete or partial
amerism; but it would be wrong to pass them by with
insisting upon the great importance which the occur
e of these isolated instances of metamere segmentation
group of otherwise unsegmented organisms possess,
the light which they may be made to throw upon the
ure of metamere segmentation in general.

The foot and head of Nautilus are in the adult inex
ably grown together, the eye being the only part belong
primarily to the head which projects from the all
racing foot. The fore-foot or front portion of the foot

in Nautilus has the form of a number of lobes c
tentacles and completely surrounding the mouth (fi
89, 91). The mid foot is a broad median muscular
which exhibits in the most interesting manner a cu
of its margins so as to form an incomplete siphe
101), a condition which is completed and render
nament in the tubular funnel which is the form pre
by the corresponding part of Dibranchiata (fig. 96)
hind foot possibly represented by the valvula fold
-surface of the siphon-like mid foot. In the Pteropo
wing-like swimming lobes (epipodia or pteropodia)
posed to the two halves of the siphon, and are mu
lar sheet of most of the foot. The fore foot pro
h head and eyes, partly mouth, but in Cheiro and Pt
and sides. A hind foot is no
ments often partly present, it is open to doubt
whether the pending portion of the foot in Sp

The lobes of the fore foot of Nautilus and of the
Dibranchiata require further description. It has
subject whether these lobes were probably recog
fish-type, correct and to be encouraged

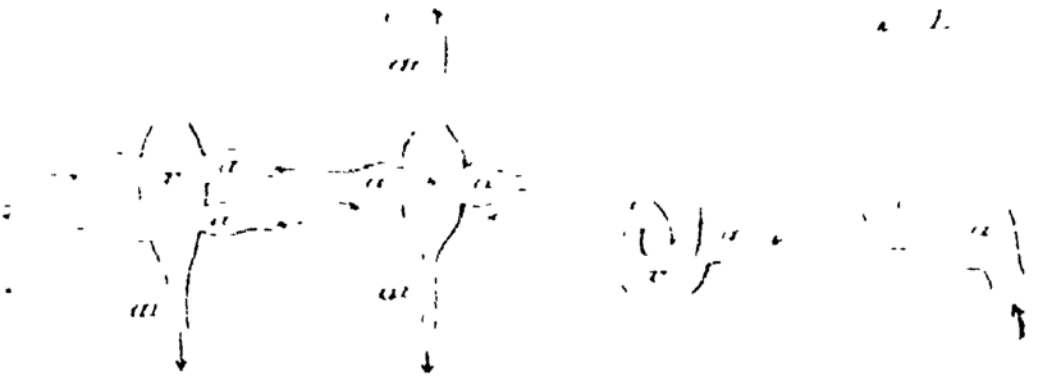
eyes are fore foot." The fore foot of Nautilus con
around the buccal cone (fig. 88, *c*), and to pa
appearance with its expanded tentacles similar to th
disc of a sea-anemone (Actinia). No figure has
been published exhibiting this circumoral disc
tentacles in natural position as when the animal is a
swimming, the small figure of Valenciennes being
in detail. All the published figures represent th
appearance of the contracted spirit specimens. M

e, B.Sc., of University College, has prepared from specimens the drawings of this part in the male and Nautilus reproduced in fig. 88, and has restored the o their natural form when expanded. The drawings ry strikingly the difference between male and female. female (lower figure), we observe in the centre of the buccal cone *c* carrying the beak-like pair of hich project from the finely papillate buccal membrane. tentaculiferous lobes of the fore foot are in immediate with this buccal cone, they are the right and left nner lobes, as we propose to call them, and the in nner lobe (*el*), called inferior because it really lies lwards of the mouth. This inner inferior lobe is a double one, representing a right and left inner lobe fused into one. A lamellated organ on its sur robably olfactory in function (*o*), marks the separation constituent halves of this double lobe. Each half a group of fourteen tentacles. The right and the nner lobes (*e*, *e*) each carry twelve tentacles. Ex-



Diagrams to show the relations of the tentacles and lobes of the fore foot in the Mollusca. [After Lankester.]

I. Dorsal view of the fore foot of *Nautilus*, with the tentacles removed from the left side.

II. Dorsal view of the fore foot of a Dibranchiate Cephalopod, with the tentacles removed from the left side.

to the e three lobe the mu-cular substance of the -emble o me foot is tu ed into a wide ring, which es e pecially thick and large in the dorsal region it i notably modified in form, offering a concavity hich the coil of the hell i received, and furnish protective hood to the retracted ma s of tentacles. part of the e ternal annular lobe of the fore foot is the "hood" (figs. 88, 91, *a*). The median antero ior lin tracer the line nece ity corresponding to ne of conver ence of the two lobe of the fore foot, primitively grea forward on each side of the and finally fu ed together along this line in front of outh. The tentacle carried by the great annular re nineteen on each side, thirty-eight in all. They newhat larger than the tentacle carried on the three lobes. The dorsalmo t pair of tentacles (marked ig. 88) are the only ones which actually belong to art of the disc which forms the great dorsal hood *a*, ood i , in fact, to a large extent formed by the enlarged - of the e two tentacle . In the Ammonite (fossil ranchiata allied to Nautilus) the dorsal surface of ad secreted a helly plate in two piece, known to ete a as Trigonellite and Aptychus. Probably, er, the double plate was carried on the surface of lobed muscular head with the form and sculptur which in Nautilus, it closely a ree. All the ten of the e external di tal ar e t in remarkable tubular s, into which they can be drawn. The sheaths of of these belonging to the external annular lobe are n fig. 91, marked *s*. The sheaths are muscular as the tentacle and are simply tubes from the base ich the solid tentacle grows. The functional signifi of this sheathing arrangement is as obscure as its ological origin. With reference to the latter, it rs highly probable that the tubular sheath represents p of a sucker such as is found on the fore-foot of the Dibranchiata. In any case, it seems to the writer sible to doubt that each tentacle, and its sheath on of the circum-oral disc of Nautilus, corresponds to a on such a lobe of a Dibranchiate. Keferstein follows in strongly opposing this identification, and in reg such tentacle as the equivalent of a whole lobe or ar Decapod or Octopod Dibranch. We find in the de these structures, especially in the facts concerni hectocotylus and spadix, the most conclusive reaso dissenting from Owen's view. We have so far e ated in the female Nautilus ninety tentacles. Fou remain which have a very peculiar position, and lead to the suggestion that the eye itself is a m tentacle. The e remaining tentacles are placed one (before) and one below (behind) each eye, and br the total to ninety four (fig. 91, *e*, *e*). They must sidered as also belonging to the fore foot which th rounds the eye.

In the adult male Nautilus we find the followi portant differences in the tentaculiferous disc as co with the female (see upper drawing in fig. 88) inner inferior lobe is rudimentary, and carries no te It is represented by three groups of lamellæ (*el*), wh not fully expo ed in the drawing. The right and le lobes are subdivided each into two portions. Th shows a larger portion carrying eight tentacles, and detached groups (*y*) of four tentacles, of which thr their sheath- united whilst one stands alone. The tentacle - may be called the "anti spadix." The le lobe shows a imilar larger portion carrying eight te and a curious conical body in front of it correspon the anti spadix. This is the "spadix" of Van der H (36). It carrie - no tentacles, but is terminated by cated lamellæ. These lamellæ appear to represent t tentacles of the anti spadix of the right internal lo are generally regarded as corresponding to that modi of the sucker-bearing arms of male Dibranchiate Ce pods to which the name "hectocotylus" is applied spadix is in fact the hectocotylized portion of th foot of the male Nautilus. The hectocotylized arm of male Dibranchiata is connected with the process o lation, and in the male Nautilus the spadix has pro similar significance, though it is not possible to s how it acts in this relation. It is important to that the modification of the fore foot in the male c pared with the female Nautilus is not confined existence of the spadix. The anti-spadix and the re of the inner inferior lobe are also male peculiarities external annular lobe in the male does not differ fr of the female; it carries nineteen tentacles on eac The four ophthalmic tentacles are also present. In the male Nautilus we find altogether sixty-two te the thirty two additional tentacles of the female being sented by lamelliform structures.

If we now compare the fore-foot of the Dibranchia that of Nautilus, we find in the first place a more arrangement of its lobes, which are either four or fi of tapering processes (called "arms") arranged in around the buccal cone, and a substitution of suck tentacles on the surface of these lobes (figs. 92, 9 The most dorsally placed pair of arms, corresponding two sides of the hood of Nautilus, are in reality th anterior (see fig. 75, (6)), and are termed the first pa the Octopoda there are four pairs of these arms (f 95), in the Decapoda five pairs, of which the fo greatly elongated (figs. 92, 93). In Sepia and othe poda (not all) each of these long arms is withdrawn pouch beside the head, and is only ejected for the of prehension. The figures referred to show some variations in form which these arms may assume.

da they are not unfrequently connected by a web, m an efficient swimming-bell. The suckers are placed ad-oral surface of the arms, and may be in one, four rows, and very numerous. In place of suckers e genera we find on certain arms or parts of the orny hooks; in other cases a hook rises from the of each sucker. The hooks on the long arms of oteuthis are drawn in fig. 97. The fore foot, with aratus of suckers and hooks, is in the Dibranchiata ally a prehensile apparatus, though the whole serie s in the Octopoda serve as swimming organs, and in (*e.g.*, the Common Octopus or Poulp) the sucker surface is used as a crawling organ.

he males of the Dibranchiata one of the arms i r less modified in connexion with the reproductive n, and is called the "hectocotylized arm." This s derived from the condition assumed by the arm se cases in which its modification is carried out to atest extent. These cases are those of the Oc *rgonauta argo* and *Parasira catenulata* (fig. 96) males of these the third arm (on the left side in uta, on the right side in Parasira) is found before eding season to be represented by a globular sac of nent. This sac bursts, and from it a long arm han its neighbours, having a small sac at its extremity asira (fig. 96, *s*), from which subsequently a long t issues. Before copulation the male clasps this th the spermatophores or packets of spermatozoa d from its generative orifice beneath the mantle-skirt, ring coitus the arm becomes detached and is left g to the female by means of its suckers. A new arm ed at the cicatrix before the next breeding season. nale, being much larger than the male, swims away he detached arm lodged beneath her mantle-skirt in a way which is not under stood, the fertilization eggs is effected. Specimens of the female Parasira e detached arm adherent were examined by Cuvier, istook the arm for a parasitic worm and gave to it ne Hectocotylus. Accordingly, the corresponding ed arms of other Siphonopoda are said to be hecto ed. Steenstrup has determined the hectocotylized on of one or other of the arms in a number of male chs as follows:—in all, except the Argonauta and a, the modification of the arm is slight, consisting in l enlargement of part or the whole of the arm, and iteration of some of its suckers, as shown in fig. 95, in Octopus and Eledone the third right arm is otylized; in Rossia the first left arm is hectocotylized ts whole length, and the first right arm also in the only; in Sepiola only the first left arm along its length; in Sepia it is the fourth left arm which is d, and at its base only; in Sepiotenthis, the same at x; in Loligo, the same also at its apex; in Loliolus, ame along its whole length; in Onuma trephes, oteuthis, and Loligopsis no hectocotylized arm has to been observed.

the females of several Dibranchs (Sepia, &c.) the s of spermatozoa or spermatophores received from ale have been observed adhering to the mantle-arms hey are passed in this case by the female to the ova er to fertilize them is unknown.

sculature, Fins, and Cartilaginous Skeleton. Without ng into a detailed account of the musculature of lus, we may point out that the great muscular masses fore-foot and of the mid-foot (siphon) are ultimately ble to a large transverse mass of muscular tissue, nds of which are visible through the integument on ght and left surfaces of the body dorsal of the ap of the mantle-skirt (fig. 89, *l*, *l*, and fig. 91, *l*). muscular areæ have a certain adhesion to the shell, and serve both to hold the animal in its shell and fixed supports for the various movements of the te ferous lobes and the siphon. They are to be ide with the ring-like area of adhesion by which the foot of the Limpet is attached to the shell of that anim fig. 27). In the Dibranchs a similar origin of the m masses of the fore-foot and mid foot from the sides shell—modified, as this is, in position and relations traced.

In Nautilus there are no fin-like expansions of the ment, whereas such occur in the Decapod Dibranch the sides of the visceral hump (figs. 92, 93). As an tion among Octopoda lateral fins occur in Pinnoctop 94, V), and in Cirrhoteuthis (fig. 94, D). In the podous division of the Cephalopoda such fin-like expa of the dorsal integument do not occur, which is to connected with the fact that another region, the mid foot, in Siphonopods [illegible] ted in expanded as a pair of fi

In Nautilus there is a curious plate-like expan integument in the mid dorsal region just behind the lying between that structure and the portion of t skirt which is reflected over the shell. This is sh fig. 90, *h*. If we trace out the margin of the pl find that it becomes continuous on each side wi sides of the siphon or mid foot. In Sepia and other pods (not in Octopoda) a closely similar plate exi exactly corresponding position (see *h* in figs. 110, 111 Sepia a cartilaginous development occurs here imme is below the integument forming the so-called "mucha drawn in fig. 116, D. The morphological signific this mucha lamella, as seen both in Nautilus and in is not obvious. Cartilage having the structure sho fig. 117 occurs in various region of the body of Si poda. In all Glossophorous Mollusca the lung-sac is supported by internal skeletal pieces, having th acter of cartilage, but in the Siphonopodous Cepha such cartilage has a wider range.

In Nautilus a large H-shaped piece of cartilage s forming the axis of the mid foot or siphon (fig. 1 B). Its hinder part extends up into the head and a the peri-œsophageal nerve-collar (*c*), while the two a ramii extend into the tongue-like siphon. In Sepia Dibranchs generally the cartilage takes a different as shown in fig. 110, C. The processes of this c cannot be identified in any way with those of the pedal cartilage of Nautilus. The lower larger pro the cartilage in Sepia is called the cephalic cartila forms a complete ring round the œsophagus, it com nerves also the gasteropod nerve-collar, so that nerves from the latter have to pass through fora the cartilage. The outer angles of this cartilage on each side so as to form a cup-like receptacle eyes. The two processes projecting right and left fr cartilage in the median line (fig. 110, C) "pro-ophthalmic cartilages;" in front of these, appa seen a piece like an inverted T, which forms a sup the base of the "arms" of the fore foot, and is the "brachial" cartilage. The Decapod Dibranchs have also the [illegible] already mentioned, and are the plate-like "[illegible]" (or [illegible]) described above the anterior end of which rests on and fits into the nuchal cartilage. In Octopoda there is no nuchal ca but two hind-like "dorsal cartilages." In Decapo are also two cartilaginous sockets on the side of the "siphon-lunge cartilages" into which the lobes of the mantle-skirt are loosely fitted. In Sepia and whole base-line of each lateral fin of the mantle (f is a "basi-pterygial cartilage." It is worthy of rema we have, thus developed, in Dibranch Siphonopods

e internal cartilaginous skeleton than is to be found of the lower Vertebrates. There are other instances Klaginous endo-skeleton in groups other than the eata. Thus in some capito-branchiate Chætopods e forms a skeletal support for the gill plumes, whilst Arachnids (Mygale, Scorpio) and in Limulus a large cartilaginous plate the ento-sternite is developed as support for a large series of muscles

Horny Teeth. The buccal cone of Nautilus is ter- by a villous mucous buccal membrane, surround pair of horny jaws. These are very strong and Nautilus, being calcified. Polished beaks of Tetra- ata are known under the name of Rhyncholite- ach the beaks are horny, but more nearly to Nautilus. They resemble in general form those of a the lower beak being the overlapping the upper one ach. The lingual ribbon and buccal apparatus be the case which is typical for Gasteropoda Mollusca. In fig. 107, A is ted a single row of teeth lingual ribbon of Nautilus, g. 107, *b*, C of other Gasteropoda.

Nautilus a long and wide œso- ed œsophagus (*œs*, fig. 105, om the ton- cular bag the apex of the visceral hump into a highly convolute sac enabling the animal to hold 110 c.c. A nearly straight s pass from the pouch- to the stomach, at which it s well-known ink-bag. In other pod these opaque contents (*i*, fig. 106, *a*, and the mu- stomach have a brown- which is very important in the alimentary tract by the cæcum. In all Dib- the cæcum be- near the and may be very spacious, larger than the stomach in ed into a spa-

hp, *lg*, *hpd*, *lod*, *b.a*

plicity in consequence of their visceral hump bein twisted. The acini of the large liver of Nautilu compacted into a solid reddish-brown mass by a membrane, as also is the case in the Dibranc The liver has four paired lobes in Nautilus, which by two bile ducts into the alimentary canal at the mencement of the intestine. The bile-ducts unite entering the intestine. In Dibranchiata the two lobes of the liver are placed antero-dorsally (b the shell in Decapoda), and the bile-ducts open in cæcum. Upon the bile-ducts in Dibranchiata are loped yellowish glandular diverticula, which are as "pancreas," though neither physiologically nor m logically is there any ground for considering either called liver or the so-called pancreas as strictly equi to the glands so-denominated in the Vertebrata. In lus the equivalent of the pancreatic diverticula Dibranchiata can be traced upon the relatively shorte duct.

Salivary Glands are not developed in Nautilus u pair of glandular masses lying on the buccal cavity be considered as such. In the Dibranchs, on the co one (Sepia, Loligo) or two pairs of large salivary are present an anterior and a posterior (Octopus, E Onychoteuthis). Each pair of salivary glands h paired duct united to form a single duct, which forward from the gland and opens into the buccal

pr
chamber (fig. 109, *vcp*). In Nautilus the viscero-per
sac open to the exterior directly by a pair of aperture
placed close to the right and on close to the left p
nephridial aperture (fig. 101, *ne*, *ne'*). The direct
of the pericardial sac to the exterior is an exception
occurs in all other Mollusca. In all other Molluscs
pericardial sac open into the nephridia and thro
or the anterior nephridium to the exterior. In Nautilu
two openings, from the viscero-pericardial sac to
nephridia. Therefore the external pore of the visc
cardial sac may possibly be regarded as a lateral
viscero-pericardial orifice from the actual modified po
sac to a position along side of its orifice. Parall
of such shifting are seen in the various positions
orifice of the ink-bag in Dibranchiata and in the
of the genital ducts of Mollusca, which in some fo
(*e.g.*, Spondylus) open into the nephridia, whilst
cases they open close by the side of the nephridia
surface of the body. The viscero-pericardial sac

-hs is very large also, and extends into the dorsal
It varies in shape -that is to say, in the extensions
rg ri ht and left between the various viscera in
i genera, but in the Decapods is largest. In an ex-
of this chamber is placed the ovary of Sepia, whilst
ricle of the heart and the branchial hearts and their
ces also lie in it. It is probable that water is
nto this chamber through the nephridia, since sand
r foreign matters are found in it. In all it opens
pair of nephridial sacs by an orifice on the wall of
ot far from the external orifice (fig. 108, *y*, *y'*).
oes not seem any room for doubting that each orifice
ond to the reno-pericardial orifice which we have
the Gastropoda, and half find accord in the Lamelli-
a. The single tube like nephridium and the peri-
n of the Pteropoda also communicate by an aperture.
irculatory organs, blood vessels, and blood of Nauti
ot differ greatly from those of Gastropoda. The
e of the heart is a four cornered body, receiving a
branchial efferent vessel (auricle) at each corner
y). It gives off a cephalic aorta anteriorly, and
r abdominal aorta posteriorly. The diagram, fig.
ves to show how this simple form of heart is related
orsal vessel of a worm or of an Arthropod, and how
mple flexure of the ventricle (D) and a sub-sequent
ion of one auricle, following on the suppression of
nchia, one may obtain the form of heart characte-
of the Ani-pleurous Gastropoda (excepting the
nchia). The flexed condition of the heart is seen
pus and is to some extent approached by Nautilus,
hat we do not perceive that perfect parallelism
hown in the figure (D). The most remarkable
presented by the heart of Nautilus is the possession
n stead of two auricles, a feature which is simply
to the metamerism of the branchiae. By the left
he heart of Nautilus, attached to it by a membrane,
ging loosely in the visceropericardial chamber, is
storm sac of Owen. This has recently been shown
e rudimentary left oviduct or sperm duct, as the
y be (Lankester and Bourne, **37**), the functional
ac and its duct being attached by a membrane
pposite side of the heart.

ephalic and abdominal aortæ of Nautilus appear,
ning to the antero-root and postero-root trunks of the
respectively, to open into sinus-like spaces surround-
viscera, muscular masses, &c. These spaces are
, but confined and shallow. Capillaries are stated
in the integument. In the Dibranchs the arterial
is very much more complete: it appears in some
end in irregular lacunæ or sinuses, in other cases
capillaries which lead on into veins. An investiga-
the capillaries in the light of modern histological
ds is much needed. From the sinuses and capil-
veins take origin, collecting into a large median
ior vena cava), which in the Dibranchs as well as in
has a ventral (pre-to-ventral) position, and runs
to the long axis of the animal. In Nautilus this
arises off at the level of the gills four branchial
ent veins (fig. 109, *avv*), which pass into the four
thent arteries. In the Dibranch at a similar posi-
vena cava gives off a right and a left branchial
ent vein (fig. 108, *v.a.v.c*, *v.a.v.c'*), each of which,
ng the wall of the corresponding nephridial sac and
g additional factors (fig. 108, *a.a*, *e.p.d*, *v.a.d*, *a.b.v*),
at the base of the corresponding branchial plume,
there a pulsating sac—the branchial heart (fig. 104,
fig. 108, *c.h*). Attached to each branchial heart is a
glandular body, which may possibly be related to
ger masses (*axc* in fig. 109) which depend into the
pericardial cavity from the branchial advehent veins
of Nautilus. From the dilated branchial heart the
chial advehent vessel proceeds, running up the ad-
face of the gill-plume (*ai*, *ai'*, fig. 104). From each
plume the blood passes by the branchial efferent ve
(*v'*, fig. 104) to the heart, the two auricles being for
by the dilatation of these vessels (*v*, *v* in fig. 104).

The blood of Siphonopoda contains the usual amœboi
puscles, and a diffused colouring matter—the hæmocy
of Fredericque—which has been found also in the blo
Helix, and in that of the Arthropods Homarus and Lim
It is colourless in the oxidized, blue in the deoxidized s
and contains copper as a chemical constituent.

The nephridial sacs and renal glandular tissue are cl
connected with the branchial advehent vessels in Nau
and in the other Siphonopoda. The arrangement is
as to render the typical relations and form of a nephri
difficult to trace. In accordance with the metameris
Nautilus already noticed, there are two pairs of neph
Each nephridium assumes the form of a sac opening
pore to the exterior. As is usual in nephridia, a glan
and a non-glandular portion are distinguished in each
these portions, however, are not successive parts of a tu
happens in other cases, but they are localized areæ of the
of the sac. The glandular renal tissue is, in fact, con
to a tract extending along that part of the sac's wall w
immediately invests the great branchial advehent
The vein in this region gives off directly from its w
complete herbage of little vessels, which branch and
stomose with one another, and are clothed by the glan
epithelium of the nephridial sac. The secretion is acc
lated in the sac and passed by its aperture to the exte
Probably the nitrogenous excretory product is very ra
discharged; in Nautilus a pink coloured powder is f
accumulated in the nephridial sacs, consisting of cal
phosphate. The presence of this phosphatic calculus by no means proves that such was the sole excretion of the renal glandular tissue. In Nautilus a glandular growth like that rising from the wall of the branchial vessel into its corresponding nephridial sac, but larger in size, depends from each branchial advehent vessel into the visceropericardial sac, probably identical with the "appendage" of the branchial hearts of Dibranchs.

m, nerves from the
ganglion to the mantle

The chief difference, other than that of number between the nephridia of the Dibranchs and those of Nautilus, is the absence of the accessory growths depending into the viscero-pericardial space just mentioned, and, of more importance, the presence in the former of a pore leading from the nephridial sac into the viscero-pericardial sac (*a*, *a'* in fig. 108). The external orifices of the nephridia are also more prominent in Dibranchs than in Nautilus, being raised on papillæ (*ap* in fig. 108; *x* in fig. 103). In Sepia, according to Vigelius (**38**), the two nephridia give off each a divertículum dorsalwards, which unites with its fellows and forms a great median renal chamber, lying between the ventral portions of the nephridia the viscero-pericardial chamber. In Loligo the f

the two nephridia to form one sac is still more obvious, ce the ventral portions are united. In Octopus the ohridia are quite separate.

Tegumental pores have not been described in Nautilus, t exist in Dibranchiata, and have been (probably oneously, but further investigation is needed) supposed introduce water into the vascular system. A pair of

Nervous System.—autilus, like the other ephalopoda (*e.g.*, Pneu- odermon, fig. 87; ctopus, fig. 113), ex bits a great concentra on of the typical Mol- scan ganglia, as shown fig. 112. The gan ia take on a band-like rm, and are but little fferentiated from their mmissures and con- ectives, an archaic ondition reminding us of Chiton. The special optic out rowth of the cerebral ganglion, the optic ganglion (fig. 12, *o*), is characteristic of the big-eyed Siphonopoda. he cerebral ganglion-pair (*a*) lying above the œsophagus is connected with two sub-œsophageal ganglion ps band-like form. The anterior of these is the peda and supplies the fore-foot with nerves *c'*, *c*, as al mid-foot (siphon). The hinder band is the viscer pleural pair fused (compare fig. 112 with fig. 8 especially with the typical Enthyneurous nervous s of Limnæus, fig. 22); from its pleural portion nerve to the mantle, from its visceral portion nerves branchiæ and genital ganglion (*d* in fig. 112), a immediate connexion with the latter is a nerve osphradium or olfactory papilla. No buccal ganglia been observed in Nautilus, nor has an enteric nervous been described in this animal, though both attain a development in the Dibranchiata. The figures (11 115) representing the nerve centres of Octopus, se exhibit the disposition of these parts in the Dibran The ganglia are more distinctly swollen than in Na In Octopus an intra-buccal ganglion pair are prese responding to the buccal ganglion pair of Gastropoda Decapoda a supra-buccal ganglion pair connecte these are also developed. In lieu of the numerou ating pallial nerves of Nautilus, we have in the D chiata on each side (right and left) a large erve passing from the pleural portion of the visceral ganglion to the mantle, where it enlar form the stellate ganglion. From each stellate ga nerves radiate to supply the powerful muscles mantle-skirt. The nerves from the visceral portion pleuro-visceral ganglion have the same course as in Na but no osphradial papilla is present. An enteric system is richly developed in the Dibranchiata, con with the somatic nervous centres through the ganglia, as in the Arthropoda through the stomato ganglia, and anastomosing with deep branches of t ceral nerves of the viscero-pleural ganglion pair been especially described by Hancock (39) in strephes. Upon the stomach it forms a single lar readily-detected gastric ganglion. It is questionable how far this and the "coeliac ganglion" formed in Decapoda by branches of the visceral nerves which pany the vena cava are to be considered as the equi of the "abdominal ganglion," which in a typical Ga nervous system lies in the middle of the visceral ner or commissure, having the right and left visceral on either side of it, separated by a greater or less of visceral nerve cord (see figs. 20, 21, 22). There little doubt that the enteric nervous system is more developed in the Dibranchiata than in other Mollus that it effects a fusion with the typical "visceral more extensive than obtains even in Gastropoda, such a fusion no doubt must also be admitted.

Special Sense Organs.—Nautilus possesses a osphradial papilla (fig. 101, *olf*) corresponding in and innervation to Spengel's organ placed at the bas ctenidia (branchiæ) in all classes of Mollusca. Thi has not been detected in other Siphonopoda. In pods it is well developed as a single ciliated pit, a the ctenidia are in that group aborted (fig. 87, Nautilus possesses other olfactory organs in the of the head. Just below the eye is a small tr process (not seen in our figures), having the struct shortened and highly modified tentacle and sheat Valenciennes, who is followed by Keferstein, this is a an olfactory organ. The large nerve which runs organ originates from the point of junction of th with the optic ganglion. The lamelliform organ i inner inferior tentacular lobe of Nautilus is poss olfactory in function. In Dibranchs behind the pit or open canal supplied by a nerve corresponding origin to the olfactory nerve of Nautilus above me

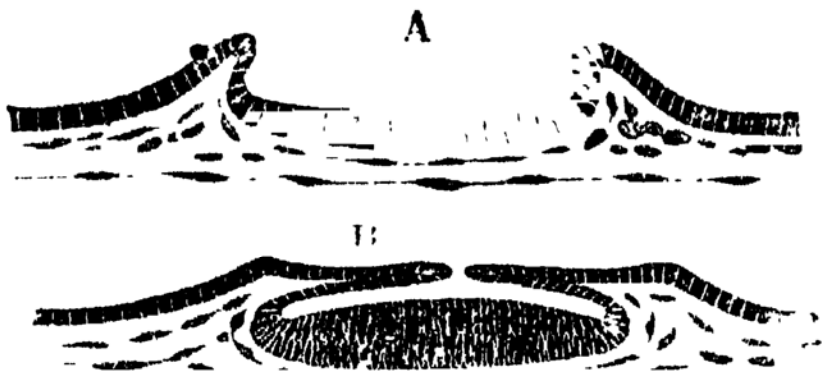
s forms as a structureless growth, projecting inwards from front wall of this vesicle (fig. 123, B, *l*). The integument und the primitive optic vesicle which has sunk below



119.—Diagrams of sections showing the early stage e of Loligo when it is, like the permanent eye of N of Patella open sac. A First appearance of the eye as a n growth of the ring-like wall to form a sac, the Loligo. (From Lankester.)

surface now rises up and forms firstly in front of the axi the eye the iridian folds (*cf* in B, fig. 123, *cf* in fig. 120 in fig. 118), and then secondly an outer circular fold ws up like a wall and completely closes over the iridian ds and the axis of the primitive vesicle (fig. 120, *C*). s covering is transparent, and is the cornea. In the anic Decapoda the cornea does not completely close leaves a central aperture traversed by the optic nerv ese forms are termed Oligopsidæ by d'Orbigny (42), whil Decapoda with closed cornea are termed Myopsidæ the Octopoda the cornea is closed, and there is ever ther fold thrown over the eye. The iris surrounding cornea presents a free circular margin, and can be drawn r the surface of the cornea by a sphincter muscle. It is acts as an adjustable diaphragm, exactly similar an

(From Hensen, after Hensen.)

ovement to the iris of Vertebrates. Sepia and allied Deca ds have a horizontal lower eyelid, that is to say, only e-half of the sphincter like fold of integument is movable he exact history of the later growth of the lens in the branchs' eye is not clear. As seen in fig. 120, it appears ter attaining a certain size, to push through the front ll of the primitive optic vesicle at the point correspond g to its centre of closure, and to project a little into the terior chamber formed by the cornea. The wall of the primitive optic vesicle adjacent to the embedded l now becomes modified, forming a so-called "ciliary in which muscular tissue is present, serving to regul focus of the lens (*cf* in fig. 120). Bobretzky (43) from Lankester, whose view is above given, in ass distinct origin to the protruding anterior segment lens (*l*¹ in fig. 118). The optic ganglion, as well other large ganglia of the Dibranchiata, originate mesoblast of the embryo. The connexion between t of the retina and the nerve fibres proceeding from th ganglion must therefore be a secondary one.

Chromatophores.—In Nautilus these remarkable ture, which we mention here as being intimately ated with the nervous system appear to be absent Dibranchiata they play an important part in the ec enabling them to compete in comparison with the sl of the contents of the mid-body, to elude the observa either prey or foe. They consist of large vesicula (true nucleated cells converted into vesicles), arran a layer immediately below the epidermis. Each c tophore cell has processes to ten muscular bands a to the walls, radiating from it on all sides. The cont of the cell itself causes the chromatophore cell to out or return to its spherical resting state by i elasticity. In the physiological state, after such a c mechanical stimulus, which is usually protected by it- nuclei it covers an area of 3 mm. The sp of the chromatophore cells is intensely coloured w of the following colours—scarlet, yellow, blue, b which are usually of the greatest purity and brilliance action of the chromatophores may be watched most in young Loligos, either under the microscope or w naked eye. The chromatophores are suddenly ex and more slowly retracted with rapidly recurring nation. All the blue, or all the red, or all the may be expanded and the other colours left qu Thus the animal can assume any particular hu changeful appearance in a most striking way with extra rapidity. There is a distinct adaptation of the assumed in the case of Sepia and other to the co the surrounding rock and bottom.

Gonads and Genital Ducts.—In Nautilus it has been shown by Lankester and Bourne (37) that the duct of both eyes are joined right and left the l large rudimentary and tentacle-like appendage described by Owen as adhering by membranous ment to the ventricle of the heart, and known by stem to communicate by a pore with the exterior the Cephalopoda agree with other Mollusca in bilaterally symmetrical genital duct to the ca not archaic members of the class. The ovary gonad) on the testis-pouch consists in Nautilu the Dibranchiata in a cut-off cavity walled off fr other viscera, near its ventro-dorsal region. This is formed by the coalescence of peritoneal wall, th enclosed is originally part of the coelom, and i and Dibranchiata, in the adult part of the visceral chamber. In Octopus and its allies the genital chamber communicates by a right and a left canal with the exterior at the end of a prominent cone of peritoneum ovary or testis is set at the growth from the inner wall chamber, which it only partly fills. In Nautilus t genital duct, which is functional, is supplied conti to the pore on the postero-dorsal part of the ou walls of the capsule in which lie the ovary testis, as the case may be. The gonad itself ap represents a single median or bilateral organ.

The true morphological nature of the genital duc Cephalopoda and of other Mollusca is a subject which speculation and inquiry. In all the cases in whi

ontinuous with the tunic of the gonad itself occur – Nematoid worms, in Arthropoda, and in Teleostean he sides. Mollusca there is an absence of definite lge as to the mode of development of the duct. s, however, from such facts as have been ascer- that the gonad lies at first freely in the cœlom, t the duct develops in connexion with the genital ad attaches itself to the embryonic gonad, or to the which grows around it. The question then arises e nature of the pore. In other groups of animals that the pore, and tunnel or tube connected with which the genital products are conveyed to the , is a modified nephridium (usually a pair, one nd one left). Is it possible that this is also the here the duct very early becomes united to the and even gives rise to the appearance of a tubular testis? Probably this is the case in Teleostean see Huxley's observations on the oviducts of the 4) but it seems to be a tenable position that in other including the Mollusca, the genital pore is a simple in the body wall leading into the body cavity ont, such as we find on the dorsal surface of the orm, which has become specialized for the extrusion genital products. Possibly, as in Nemertine and ood worms, the condition preceding the development definite genital pores was one in which a temporary of the body wall occurred at the breeding season, is temporary aperture has gradually become perma The absence of genital pores in Patella, and some branchs which make use of the nephridia for the on of their genital products, suggests that the very Mollusca or their forefathers were devoid of genital nd pore. In no Mollusca, however, is the nephrid ed in the same way as a genital duct as it is in the oda, the Cephalopoda, and the Vertebrata; for the outh of the nephridium in Mollusca leads into the dial space, and it is not through this space and thus that the genital products of any Mollusca enter phridium (except perhaps in Neomenia), although y this month that the genital products enter the dium in the former classes above named. Hence angement in Patella, &c., is to be looked upon as a development from the simpler condition when the a brought forth by rupture of schizocœlic, trochoïds, , and not as derived from the common arrangement otation of a nephridium to the genital efferent func nephridial.[1]

unctional oviduct of Nautilus forms an albuminif gland as a diverticulum, which appears to corres a dilatation in the male duct, which succeeds the ell, and is called the "accessory gland." The male s a second dilatation (Needham's sac), and then is ed in the form of a large papilla. In Dibranchs, e ducts are but little more elaborated. They are externally. In female Octopoda, in Omma-trephes, and in the Octopod (*Eledone moschata*) the genital are paired, opening right and left of the anus. But other Dibranchs a male genital duct only is deve viz., that of the left side, and leads from the genital ere it embraces the gonad to a symmetrically placed In the male Dibranchs the genital duct is coiled rovided with a series of glandular dilatations and

[1] Intermediate arrangements lead over to this nephridial future, either ome of Polychæta (in Eunicidæ, genus Eunice, divisible into Ne- e and Ichnoteæ), the testis or the nephridium serving as a the latter a portal vein appears to be being developed. In each of ver groups the pore may be (1) devoid of a duct, (2) provided t which is unattached to the gonad and opens into the body- 3) provided with a duct which fuses with the gonad. The ducts of Ichnoteæ forms may be called Ichnogonaducts, as dis- ed from the Nephrogonaducts of nephridial forms.

receptacles. These are connected with the formati he spermatophores. In the Siphonopoda the sper fluid does not flow as a liquid from the genital po the spermatozoa are made up into little packets extrusion. In other Mollusca (Pulmonata) and in annuals (Chætopoda) this formation of "sperm-ro known, but in the Siphonopoda it attains its h development. Exceedingly complicated structures cylindrical form (sometimes an inch in length) are in the male genital duct by a secretion which embe cements together the spermatozoa. They are form Nautilus as well as in Dibranchs, the actual manner in their complicated structure is produced being not cap pictured. Accessory glands not forming part of the o but furnishing the material for enclosing the eggs in an envelope, are found as paired structures, opening sou behind the anus in Nautilus (101, *g.n.*) and in t branchs. They are known as the nidamental gland the female Sepia they are particularly large and pro and are accompanied by a second smaller pair.

Reproduction and Development. The details of congress and of the actual fertilization of the egg are unknown in Nautilus, and imperfectly in the Dib and the Pteropoda. Allusion has already been m the subject in connexion with the heterocotylized arm mature eggs of Nautilus are unknown, as well as the ance which they present when deposited. In the Dib the eggs are always very large; in some cases the a of food-yelk infused into the original egg cell is so g to give it the size of a large pea. This results mode of development which is only known outsi class among the Vertebrata, it is discoblastic. The plasm of the fertilized egg cell segregates to one the egg, and there undergoes cell division, resulting formation of a disc of cleavage cells (fig. 121, (1)) bling the cicatricula of the hen's egg, which subse spreads over and invests the whole egg (fig. 121, (2) details of this process we must refer the reader t works (**45, 46**); but it may here be noted that in addi the layer of cleavage cells, which consists of more th stratum of cells in the future embryonic area as c to the yelk-sac area, additional cells are formed mass of residual yelk apparently by an independent of segregation, each cell having a separate origin, they are termed "autoplasts." The autoplasts eve form a layer of fusiform cells (fig. 121, (7), *h*; fig. and fig. 123, *ps*), the "yelk-membrane" which ever rests upon and encloses the residual yelk. The c cells form a single layer on the yelk-sac area and two on the embryonic area, an outer layer one cell deep (f *ep*), and an inner the middle layer of the three is often thick and many cells deep (fig. 122, *m*). T great difficulty here in identifying the layers with th typical layers of other animal embryos, except in to the outermost, which corresponds with the epib Vertebrates in many respects. The middle layer, he gives rise to the nerve ganglia as well as to the m cœlom, and skeleto-trophic tissues, and to the mid of the alimentary canal with its hepatic diverticu liver (see fig. 121, (7) and explanation, where the c the mid gut as a vesicle *x* is seen). It is clearly, th something more than the mesoblast of the Ver giving rise, as it does, to important organs formed epiblast and hypoblast in other animals. Lastly, th membrane, though corresponding to the Vertebrat blast in position and structure, furnishes no part alimentary tract, but disappears when the yelk pletely absorbed. In fact, the developmental phe in Sepia, Loligo, and Octopus are profoundly pertu the excessive proportion of food-yelk. Balfour ha

the chick the orifice of closure of the overspreading
arm does not represent the whole of the blastopore,

The FOOT is comm imple cylindrical or ploughshare-shaped organ, use boring in sand and mud, and more rarely presents a ng disc similar to that of Gastropoda; in some forn aborted. The paired CTENIDIA are very greatly dev ht and left of the elongated body, and form the prominent organ of the group. Their function is not respiratory but nutritive, since it is by the cu produced by their ciliated surface that food partic brought to the feebly developed mouth and buccal

The Lamellibranchia present as a whole a som uniform structure, so that, although they are very num it is not possible to divide them into well-marked sub- or sections, and orders. The chief points in whic vary are (1) in the structure of the ctenidia or bra plates, (2) in the presence of one or of two chief m the fibres of which run across the animal's body fro valve of the shell to the other (adductors); (3) in the g or less elaboration of the posterior portion of the m but so as to form a pair of tubes, by one of which i introduced into the sub pallial chamber, whilst other it is expelled; (4) in the perfect or deficient syn of the two valves of the shell and the connected soft as compared with one another; (5) in the develop the foot as a disc like crawling organ (Area, Nucula, N culus, Trigonia, Lepton, Galeomma), as a simple p like or tongue-shaped organ (Unionacea, &c.), as a re- saltatory organ (Cardium, &c.), as a long burrowing dra (Solenacea, &c.), or its partial (Mytilacea) or eve plete abortion (Ostracea).

The essential Molluscan organs are, with these tion, uniformly well developed. The MANTLE SK always long, and hides the rest of the animal from vi dependent margins meeting in the middle line belo ventral surface when the animal is retracted; it is were, cut in the median line before and behind s form two flaps, a right and a left; on these the rig the left calcareous valves of the shell are borne respec connected by an uncalcified part of the shell call ligament In many embryo Lamellibranchs a centr PRIMITIVE SHELL GLAND or follicle has been detecte 8 and 151). The MOUTH lies in the median line ant the ANUS in the median line posteriorly.

Both CTENIDIA right and left are invariably prese axis of each taking origin from the side of the body the schematic archi Mollusc (see fig. 1 and fig. 13 pair of NEPHRIDIA opening right and left, rather far f on the sides of the body, are always present. Each by its internal extremity into the pericardium. A GENITAL APERTURES, connected by genital ducts wi paired gonads, are found right and left near the nep pores, except in a few cases where the genital duc that of the nephridium (Spondylus). The sexes are but not always, distinct. No accessory glands or cop organs are ever present in Lamellibranchs. The e often act as brood-pouches.

A dorsal contractile HEART, with symmetrical rig left auricles (fig. 113, A) receiving aerated blood fr ctenidia and mantle-skirt, is present, being unequa

development of the Pteropoda, so far as known, no point of contact with that of the Siphonopoda than with that of the Gastropoda, owing to the fact the mouth does not acquire a process of food-yolk. Con ly, we find typical trochosphere and veliger larvae the Lamellibranchia (fig. 8, C, and fig. 8 D), whilst the Ihering has made known very table to the Gymnosomata, and with ordered (fig. 8 D). The former set of demonstrations for all the view which ... some zoologists, viz., that the velar ... the same thing as the ptero lobes of ... and foot of Pteropoda. The latter are of imp... ing, showing that, as in embryo opoda so ... Pteropoda the tucker bearing f the foot ... tructures, and only e the head and ... round the mouth as the result of bryonic growth

BRANCH B. *LIPOCEPHALA.*

Characters.—Mollusca with the head region undeveloped Shelly eyes are present, the buccal cavity is devoid

veloped only in those few forms which are inequivalve. The typical PERICARDIUM is well developed. It appears, as in other Mollusca, not to be a blood-space although developed from the cœlom, and it communicates with the exterior by the pair of nephridia. As in Cephalopoda (and possibly other Mollusca) water can be introduced through the nephridia into this space. The ALIMENTARY CANAL keeps very nearly to the median vertical plane whilst exhibiting a number of flexures and loopings in this plane. A pair of large glandular outgrowths, the so-called "liver" or great digestive gland, exists as in other Molluscs. A pair of pedal OTOCYSTS, and a pair of OSPHRADIA at the base of the gills, appear to be always present. A typical NERVOUS SYSTEM is present (fig. 144), consisting of a cerebro-pleuro visceral ganglion pair, united by connectives to a pedal ganglion-pair and an osphradial ganglion pair (parieto splanchnic).

A special cæcum connected with the pharynx is sometimes found, containing a tough flexible cylinder of transparent cartilaginous appearance and unknown significance, called the "crystalline style" (Mactra), which probably represents the radular sac of Glossophora. In many Lamellibranchs a gland is found on the hinder surface of the foot in the mid line, which secretes a substance which sets into the form of threads: the so-called "by-sus" by means of which the animal can fix itself. Sometimes the gland is found in the young and not in the adult (Anodon Unio, Cyclas). In some Lamellibranchs (Pecten, Spondylus, Ostrea, Solenomya, Tellina, Pectunculus, Galeommata, &c.), although cephalic eyes are always absent, special eyes are developed on the free margin of the mantle-lobe, apparently by the modification of tentacles which are commonly found there (fig. 145). The existence of pores in the foot and elsewhere in Lamellibranchs by which liquid can pass into and out of the vascular system although asserted as in the case of other Mollusca, appears to be improbable. It has yet to be shown by satisfactory microscopic sections that the supposed pores are anything but epidermal glands.

The Lamellibranchia live chiefly in the sea, some in fresh waters. A very few have the power of swimming by opening and shutting the valves of the shell (Pecten, Lima), most can slowly crawl or rapidly burrow; others are when adult, permanently fixed to stones or rocks either by the shell or the byssus. In development some Lamellibranchia pass through a free-swimming trochosphere stage with preoral ciliated band; other fresh water forms which carry the young in brood pouches formed by the ctenidia have suppressed this larval phase.

The following classification and enumeration of genera are based primarily upon the characters of the adductor muscles. The Heteromya and Monomya must be conceived of as derived from forms resembling such Gastroconchon-Isomya as Nucula and Trigonia, which undoubtedly are the nearest living representatives of the ancestral Lamellibranchia, and bring us nearest to the other branch of the Mollusca, the Glossophora.

Order 1.- Isomya.

Character. Anterior and posterior adductor muscles of approximately equal size.

Sub-order 1. - *Integropallia.*

Characters. — Marginal attachment of the mantle to the shell not inflected to form a sinus; siphons not developed in some, present in most.

Family 1. — *Arcacea.*

Genera: *Arca*, L. (fig. 132); *Cucullæa*, Lam.; *Pectunculus*, Lam.; *Limopsis*, Sassi; *Nucula*, Lam. (fig. 131); *Isocardia*, Munster; *Leda*, Schu.; *Yoldia*, Moll.; *Solenella*, Sowerby, &c.

Family 2. — *Trigoniacea.*

Genera: *Trigonia*, Brug.; *Axinus*, Sow.; *Lyrodesma*, Conrad.

Family 3. — *Unionacea.*

Genera: *Unio*, Retz.; *Castalia*, Lam.; *Anodon*, Cuv. &c.); *Iridina*, Lam.; *Mycetopus*, d'Orb., &c.

Family 4.- *Lucinacea*

Genera: *Lucina*, Brug.; *Cardis*, Cuv.; *Diplodonta* *Kellia*, Turton; *Montacuta*, Turton; *Lepton*, Turton *omma*, Turton; *Astarte*, Sow.; *Crassatella*, Lam.; Ag.; *Cardita*, Brug., &c.

Family 5. *Cyprinacea*

Genera: *Tridacna*, De C.; *Chama*, L.; *Diceras*, Lk.; *Lucinodon*, Lam.; *Hippopodium* Sow.; *Cardi* *Corbicula* Mke.; *Cyrena*, Lk. *ata*, Brug. (fig. 14 S:1351); *Cyprina*, Lam., &c.

Order 2. *Sesamyaria*

Lamellibranch. In some of the Siphonate Isomya,
are hence termed "Sinupallia," the pallial muscle
simple but deeply incurved at the posterior region s
allow of the large pallial siphons being retracted wit
shell or expanded at will (fig. 127, and figs. 140, 1

It is the approximate equality in the size of the anterior and posterior adductor muscles which has led to the name Isomya for the group to which Anodon belongs. The hinder adductor muscle may be considered as representing morphologically the transverse fibres of the root of the foot of Nautilus by which it adheres to its shell (fig. 91, *k*), the annular muscular area of Patella (fig. 27, *c*), and the columella muscle of the Gastropods generally. It is always large in Lamellibranchs, but the anterior adductor may be very small (Heteromya), or absent altogether (Monomya). The anterior adductor muscle is in front of the mouth and alimentary tract alto and must be regarded as a special and peculia lopment of the median anterior part of the man

of gaping of the shell valves is essential to the life
Lamellibranch appears from the fact that food to
it, water to aerate its blood, and spermatozoa to
its eggs, are all introduced into this gaping cham
currents of water, which are set going by the
developed etenidia. The current of water enters i
sub-pallial space at the spot marked *e* in fig. 12
and, after passing as far forward as the mouth *m* in f
(5), takes an outward course and leaves the sub
space by the upper notch *d*. These notches are
in Anodon as the afferent and efferent siphonal
respectively, and correspond to the long tube like
inferior and efferent superior "siphons" formed
mantle in many other Lamellibranchs (fig. 130).

Whilst the valves of the shell are equal in Ano
and in many Lamellibranch (Ostrea, Chama, Corbu
one valve larger, and the other smaller and sometim
whilst the larger shell may be fixed to rock or to
(Ostrea, &c.). A further variation consists in the d
ment of additional shelly plates upon the dorsal
tween the two large valves (Pholadidae). In *Pholas*
we find a pair of umbonal plates, a dorsal umbonal pl
a dorsal plate. It is to be remembered that the whol
cuticular hard product produced on the dorsal surfa
on the mantle flaps is to be regarded as the shell
which a median band like area, the ligament usually
unsclerified, so as to result in the production of two
united by the cuticle ligament. But the shelly su
does not always in boring forms adhere to this for
its first growth. In *Xylophaga* the whole of the
mantle area secretes a continuous
tube, although in the young conditi
valves were present. These are se
129) set in the firm substance of th
tubular shell, which has even replac
ligament, so that the tube is comple
To redo a similar tube is formed as the
elongate (boring in wood), the original
valves not adhering to it but remaining
able and provided with a special m
apparatus in place of a ligament.

Let us now examine the organs w
beneath the mantle-skirt of Anodon,
bathed by the current of water wh

and the posterior a continuation of the inner gill-
There is no embryological evidence to support this
gested connexion, and, as will appear immediately
history of the gill-plates in various forms of La
branchs does not directly favour it. Yet it is very
able that the labial tentacles and gill plates are
fications of a double horseshoe-shaped area of ci
filamentous processes which existed in ancestral Mo
much as in Phoronis and the Polyzoa, and is to be
pared with the continuous prae- and post-oral ciliated
of the Echinid larva Pluteus and of Tornaria (**49**).

The gill plates have a structure very different from
of the labial tentacles, and one which in Anodon is
larly complicated as compared with the condition pres
by these organs in some other Lamellibranchs, and
what must have been their original condition in the
tors of the whole series of living Lamellibranchia.
phenomenon of "coalescence" which we have alread
to note as showing itself so importantly in regard t
free edges of the mantle-skirt and the formation o
siphons, is what, above all things, has complicate
structure of the Lamellibranch ctenidium. Our p
knowledge of the interesting series of modifications th
which the Lamellibranch gill-plates have developed to
complex final form is due to R. Holman Peck
of Mytilus (**51**). The Molluscan ctenidium is
cally, as shown in fig. 2, a plume like
ture, consisting of a vascular axis, on
side of which is set a row of numero
demibranch or filamentous processes,
processes are hollow, and receive the v
blood from, and return it again aerated

how that the neighbour-
ing filaments are held to-
gether by patches of cilia,
called 'ciliated junc-
tions,' which interlock
with one another just as
two brushes may be made
to do. In fig. 133, A a
portion of four filaments
of a ctenidium of the Sea
Mussel (Mytilus) is repre-
sented, having precisely
the same structure as
those of Area. The fila
ments of the gill (ctenid-
dium) of Mytilus and
Area thus form two
closely set rows which
depend from the axis of
the gill like two parallel
plates. Further, their structure is profoundly modifi
the curious condition of the free ends of the depe
filaments. These are actually reflected at a sharp an

s the condition seen in Arca and Mytilus, the so
plates dividing upon the slightest touch into their
tuent filaments, which are but loosely conjoined by
"ciliated junctions." Complications follow upon
n other forms. Even in Mytilus and Arca a con
n is here and there formed between the ascending
escending rami of a filament by hollow extendible
owths called "interlamellar junctions" (*ilj.* in B, fig.
Nevertheless the filament is a complete tube formed
tonous substance and clothed externally by ciliated
elium, internally by endothelium and lacunar tissue
n of connective tissue"—as shown in fig. 133, C
let us suppose, as happens in the genus Dreissena
us not far removed from Mytilus that the ciliated
ilamentar junctions (fig. 136) give place to solid
ament inter-filamentar junctions, so that the filament
onverted, as it were, into a trellis work. Then let us
so that the inter lamellar junctions which we have
ly noted in Mytilus become very numerous, large,
rregular; by them the two trellis works of filaments
be united so as to leave only a sponge-like set
aces between them. Within the trabeculæ of the
e-work blood circulates, and between the trabeculæ
vater passes, having entered by the apertures left

in the trellis-work formed by the united gill fila
(fig. 138, A, B). The larger the intra lamellar s

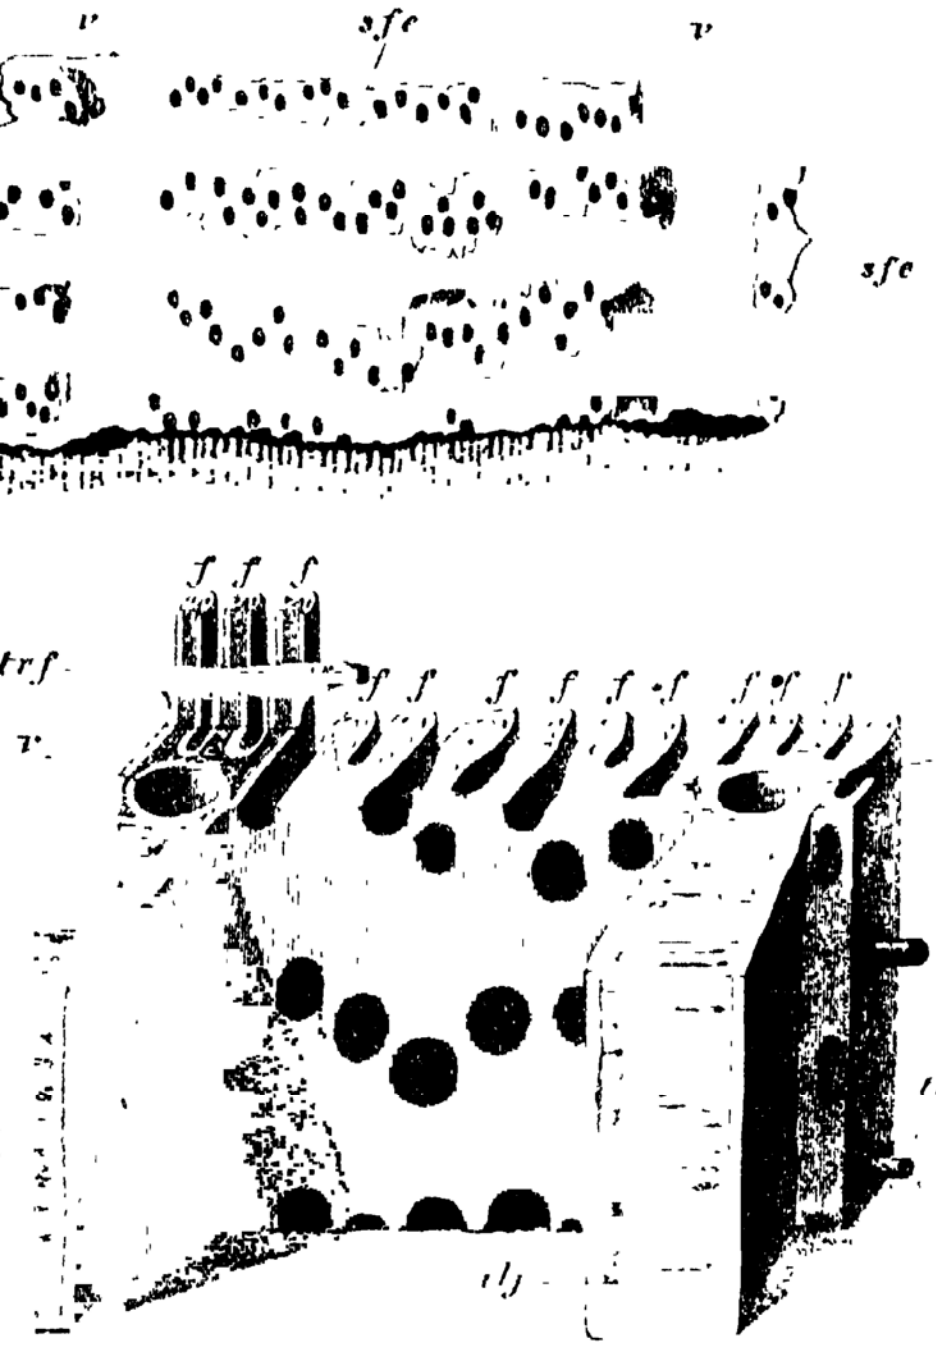
the foot is reached. This is difficult to see at all i don, but if the mantle-skirt be entirely cleared awa if the dependent lamellae which spring from the et axis be carefully cropped away so as to leave the axi intact, we obtain the form shown in fig. 131, where *b* are respectively the left and the right ctenidial ax jecting freely beyond the body. In Area this can with far less trouble, for the filaments are more ea moved than are the consolidated lamellae formed filaments of Anodon, and in Area the free axes ctenidia are large and firm in texture (fig. 132, *c*, *d*

If we were to make a vertical section across th axis of a Lamellibranch which had the axis of its cte free from its origin onwards, we should find such re as are shown in the diagram fig. 135, A. The gill is seen lying in the sub-pallial chamber between t *b* and the mantle *c*. From it depend the gill-filam lamellae formed by united filaments—drawn as bla *f*. On the left side these lamellae are represented ing only a small reflected growth, on the right si reflected ramus or lamella is complete (*fr* and *cr*) actual condition in Anodon at the region where t commence anteriorly is shown in fig. 135, B. The the ctenidium is seen to be adherent to, or fused crescence with, the body-wall, and moreover on ea the outer lamella of the outer gill-plate is fused mantle, whilst the inner lamella of the inner gill- fused to the foot. If we pass a little backwards a another section nearer the hinder margin of the f

arrangement shown diagrammatically in fig. 135, more correctly in fig. 142. In this region the inner of the inner gill-plates are no longer affixed to the Passing still further back behind the foot, we find



—Gill-lamellæ of Anodon (after Peck). A, Piece of an inner gill-plate torn from the connective tissue also partly cut away round the s, their transverse junctions *tr*, and the "window *gl*, internal surface of the lamella; *x*, *y*, *z* in the outer lamella of the outer gill plate and surface (after Peck). *f*, constituent filaments, *tr* nsverse inter-filamentar junctions; *z* n. lon the condition shown in the section D, fig. 135. es *i* are now free; the outer lamella of the outer es (*x*) still adhere by coneresceuce to the mantle hilst the inner lamellæ of the inner gill plates meet nother and by coneres- at *g*. In eral view of inal with l mantle- and gill the line of rence of the lamellæ of nner gill- is readily it is marked *aa* in fig. 124, (5). In the same the free part of the inner lamella of the inner e resting on the foot is marked , whilst the l part the most anterior- - has been snipped issors so as to show the genital and nephridial es *x* and *y*. The coneresceuce, then, of the ge of the reflected lamellæ of the gill plates of is very extensive. It is important, because such rescence is by no means universal, and does not or example, in Mytilus or in Area; further, because

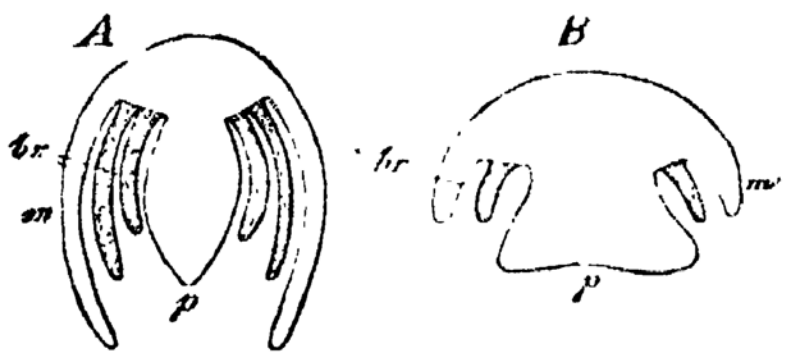

FIG. 139. Transverse sections of *A*, a Lamellibranch, and *B*, an Isopleurous Gastropod (Chiton). They show the relations of *p*, the foot; *br*, the branchiæ; and *m*, the mantle. (From Gegenbaur.)

when its occurrence is once appreciated, the reduc the gill-plates of Anodon to the plume-type of the s etenidium presents no difficulty; and, lastly, it has ance in reference to its physio logical significance. The me- chanical result of the coales- cence of the outer lamellæ to the mantle flap, and of the inner lamellæ to one another as shown in section D, fig. 135, is that the sub-pallial space is divided into two paces by a horizontal sep tum. The upper space (*x*) communicates with the outer world by the excurrent or su perior siphonal notch of the mantle (fig. 124, *d*), the lower pace communicates by the lower siphonal notch (*e* in fig. 124). The only comm tion between the two spaces, excepting through the work of the gill plate, is by the slit *c* in fig. 124, by the non-coalescence of a part of the inner lamella inner gill plate with the foot. A probe (*z*) t nto through this slit-like passage, and it can be seen to pa the excurrent siphonal notch. It through this p or indirectly through the pores of the gill plates, t water introduced into the lower sub-pallial space m on its way to the excurrent siphonal notch. subdivision of the pallial chamber, and direction

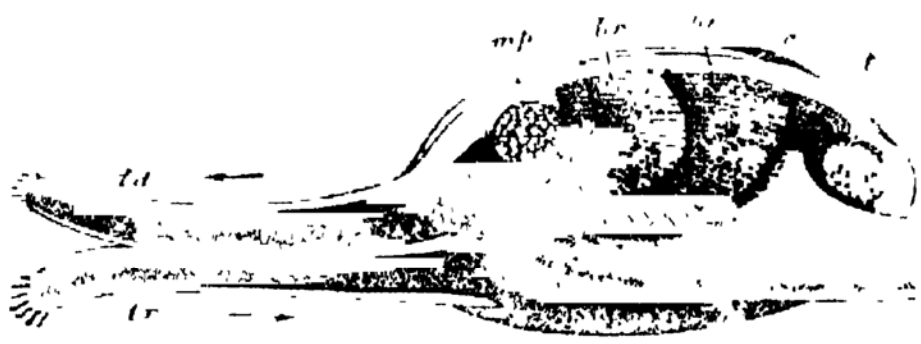

FIG. 141.—The same animal as fig. 140, with the foot and siphons Letters as in fig. 140. (From the Challenger.)

currents set up within it do not exist in a num Lamellibranchs which have the gill lamellæ compar

free (Mytilus, Area, Trigonia, &c.), and it is in these that there is least modification by coalescence of t mary filamentous elements of the lamellæ. Proba gill-structure of Lamellibranchs will ultimately some classificatory characters of value when the been thoroughly investigated throughout the class.

The alimentary canal of Anodon is shown in fig. 1 The mouth is placed between the anterior adduct the foot; the anus opens on a median papilla ov the posterior adductor, and discharges into the s pallial chamber along which the excurrent stream The coil of the intestine in Anodon is similar to other Lamellibranchs, but the crystalline style diverticulum are not present here. The rectum t the pericardium, and has the ventricle of the heart w as it were around it. This is not an unusual arran in Lamellibranchs, and a similar disposition occurs Gastropoda (Haliotis). A pair of ducts (*rr*) lead t last enlargement of the alimentary tract called s into a pair of large digestive glands, the so-called the branches of which are closely packed in this (*gl*). The food of the Anodon, as of other Lamellib consists of microscopic animal and vegetable org which are brought to the mouth by the stream wh into the sub-pallial chamber at the lower siphona (*c* in fig. 124). Probably a straining of water fro

s is effected by the lattice-work of the ctenidia or
es.

heart of Anodon consists of a median ventricle em-
the rectum (fig. 143, *A*), and giving off an anterior
osterior artery, and of two auricles which open into
rice by orifices protected by valves.

blood is colourless, and has colourless amœboid
, floating in it. In two Lamellibranchs, *Solen*
ilis (Lankester, 31) and *Area Noæ*, the blood is crimson,
to the presence of corpuscles impregnated with
obin (Lankester, 31). In Anodon the blood is
by the ventricle through the arteries into vessel
, which soon become irregular lacunæ surround

pair of nephridia or Anodon called in Lamelli
the organs of Bojanus, lie below the membranous
the pericardium, and open into it by two well
apertures (*e* and *f* in fig. 143). Each nephridium,
ing bent upon itself as shown in fig. 143, C, D,
the exterior by a pore placed at the point marked
121, (5), (6)). It is no doubt possible, as in the

Gastropoda and Cephalopoda, for water to enter from the
exterior by the nephridia into the pericardium, but that
if ever does so is as yet not proved. What is certain
from the set of the ciliary currents is that liquid generally

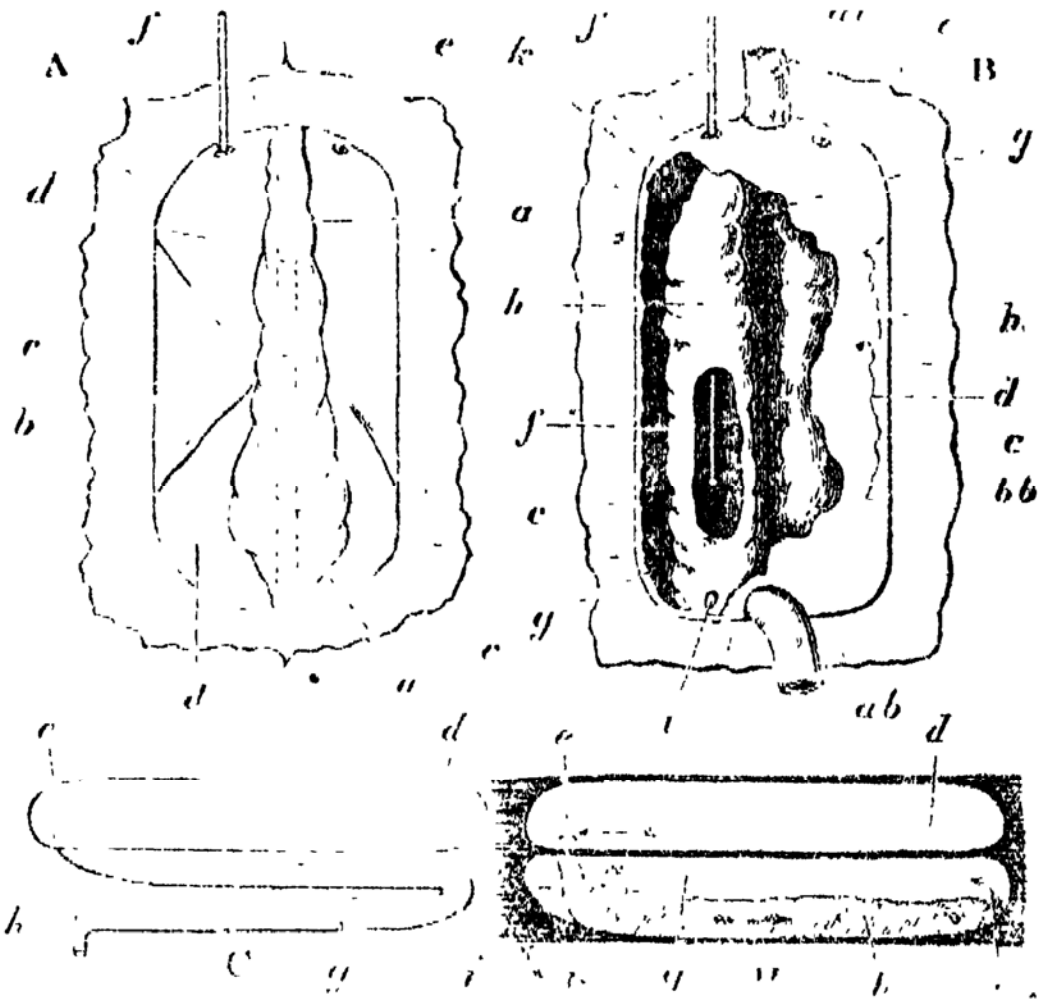

FIG. 143.—Diagrams showing the relations of pericardium and nephridia in a Lamellibranch such as Anodon. A, Pericardium opened dorsally so as to expose the heart and the floor of the pericardial chamber *d*. B, Heart removed, floor of the pericardium cut away on the left side so as to expose the non-glandular sac of the nephridium, exposing the glandular sac *b* which has also cut away so as to show the probe *i*. C, Ideal pericardium and nephridium viewed dorsally. D, Lateral view showing the actual relations of the glandular and non-glandular sacs of the nephridium. The arrows indicate the course of fluid from the pericardium outwards. *a*, ventricle of the heart; *a'*, auricle; *b*, cut remnant of the auricle; *c*, dorsal wall of the pericardium cut and reflected; *e*, reno-pericardial orifice; *f*, probe introduced into the left reno-pericardial orifice; *g*, non-glandular sac of the left nephridium; *h*, glandular sac of the left nephridium; *k*, pore leading from the nephridium into the non-glandular sac of the left nephridium; *k'*, pore leading from the non-glandular sac to the exterior; *ac*, anterior, *ab*, posterior extremities of the intestine and ventricle.

pass out of the pericardium by the nephridia. One half of each nephridium is of a dark green colour and glandular (*h* in fig. 143). This opens into the reflected portion which overlies it as shown in the diagram fig. 143, D, *i*; the latter has non-glandular walls, and opens by the pore *k* to the exterior. The nephridia may be more ramified in other Lamellibranchs than they are in Anodon. In some they are difficult to discover. That of the common oyster has recently (1882) been detected by Hoek (54). Each nephridium in the oyster is a pyriform sac, which communicates by a narrow canal with the urino-genital groove placed to the front of the great adductor muscle; by a second narrow canal it communicates with the pericardium. From all parts of the pyriform sac narrow stalk-like tubes are given off, ending in abundant widely spread branching glandular cæca, which form the essential renal secreting apparatus. The genital duct opens by a pore into the urino-genital groove of the oyster (the same arrangement being repeated on each side of the body) close to but distinct from the aperture of the nephridial canal. Hence, except for the formation of a urino-genital groove, the apertures are placed as they are in Anodon. Previously to Hoek's discovery a brown-coloured investment of the auricles of the heart of the oyster had been supposed to represent the nephridia in a rudimentary state. This investment, which occurs also in Mytilus but not in Anodon, may possibly consist of secreting cells, and may be comparable to the pericardial accessory glandular growths of Cephalopoda.

Nervous System and Sense-organs.—In Anodon there are three well developed pairs of nerve-ganglia (fig. 144, B and fig. 121, (6)). An anterior pair, lying one on each side of the

mouth (fig. 144, B, *a*) and connected in front of it by a commissure, are the representatives of the cerebral, pleural, and visceral ganglia of the typical Mollusc, which are not here differentiated as they are in Gastropods (compare, however, fig. 67). A pair placed close together in the foot (fig. 144, B, *b*, and fig. 124, (6), *ax*) are the typical pedal ganglia; they are joined to the cerebro-pleuro-visceral ganglia by connectives.

Posteriorly beneath the posterior adductors, and covered only by a thin layer of elongated epidermal cells, are the olfactory ganglia, their epidermal clothing constituting the pair of osphradia, which are thus seen in Lamellibranchs to occupy their typical position and to have the typical innervation, the nerve to each osphradium being given off by the visceral ganglion that is to say, by the undifferentiated cerebro-pleuro-visceral proper side. This identification of the pe pair of Lamellibranchs is due to Spen-

anatomists have considered this ganglion pair as corresponding to either the pleural or the visceral of Gastropods, or to both, and very usually it is termed "the parieto splanchnic" (Huxley).

The sense organs of Anodon other than the osphradia consist of a pair of otocysts attached to the pedal ganglia (fig. 124, (6), *ay*). The otocysts of Cyclas are peculiarly favourable for study on account of the transparency of the small foot in which they lie, and may be taken as typical of those of Lamellibranchs generally. The structure of one is exhibited in fig. 146. A single otolith is present as in the veliger embryos of Opisthobranchia. In adult Gastropoda there are frequently a large number of red lime otoliths instead of one.

Anodon has no eyes of any sort, and the tentacles on the mantle edge are limited to its posterior border. This deficiency is very usual in the class; at the same time, many Lamellibranchs have tentacles on the edge of the mantle supplied by a pair of large well-developed nerves, which are given off from the cerebro pleuro visceral ganglion pair,

and very frequently some of these tentacles have und a special metamorphosis converting them into organized eyes. Such eyes on the mantle-edge are in Pecten, Spondylus, Lima, Ostrea (?), Pinna, Pectu Modiola, Mytilus (?), Cardium, Tellina, Mactra, Venus, Solen, Pholas, and Galeomma. They are totally distinct from the cephalic eyes of typical Mollusca, and have a different structure and histological development. They have not originated as pits but as tentacles. They agree with the dorsal eyes of Onchidium (Pulmonata) in the curious fact that the optic nerve penetrates the capsule of the eye and passes in front of the retinal body (fig. 145), so that its fibres join the anterior face of the nerve-end in Vertebrates, instead of their posterior face as cephalic eye of Mollusca and Arthropoda, moreov lens is not a cuticular product but a cellular str which, again, is a feature of agreement with the Ver eye. It must, however, be distinctly borne in mi there is a fundamental difference between the eye of brates and of all other groups in the fact that Vertebrata the retinal body itself a part of the nervous system, and not a separate modification epidermis (nervous as opposed to epidermic). The ture of the repaired eye of several of the above genera has not been carefully examined. In Pect Spondylus, however, they have been fully studied (145, and explanation).

The gonads of Anodon are placed in distinct m female individual. In some Lamellibranchs (for in the European Oyster and the *Pecten opercularis* th are united in the same individual, but here, as i hermaphrodite animals, the two sexual elements ripe in the same individual at the same moment. been conclusively shown that the *Ostrea edulis* de fertilize itself. The American Oyster (*O. virginia* the Portuguese Oyster (*O. angulata*) have the sexe rate, and fertilization is effected in the open wate the discharge of the ova and the spermatozoa fr female and male respectively. In the *Ostrea edulis* zation of the ova is effected at the moment of their from the uro-genital groove, or even before, by m spermatozoa drawn into the sub-pallial chamber by current of water, and the embryos pass through early stages of development whilst contained between cell-lamellæ of the female parent (fig. 69). In Anod pass into the space between the two lamellæ plate, and are there fertilized, and advance

LOCH, or MOLECH—in Hebrew, with the doubtful on of 1 Kings xi. 7, always הַמֹּלֶךְ with the article ame or title of the divinity which the men of Judah

in the last ages of the kingdom were wont to propi the sacrifice of their own children. The phra in speaking of these sacrifices is "to make pass daughter pass through fire to the Moloch" (2 Kings

. xxxii. 35, and so without the words "through fire" viii. 21). but it appears from Ezek. xvi. 20, 21 is piacle denotes a human holocaust,[1] and not, as es has been thought, a mere consecration to Moloch ing" through or between fires, as in the Roman *Palilia* ntal rites elsewhere. Human sacrifices were com- s mute heathenism, and at least the idea of such was not unknown to Israel in early times (Isaac, ah daughter: though in the sunny days of the when religion was a joyous thing, there is no to think that they were actually practised.' It nerwise in the neighbouring nations, and in par we learn from 2 Kings iii. 27 that the proudest of his sons and heir was the last offering which e of Moab made to deliver his country. Even the historical writers to this act the effect of rous indignation against the invading host of Israel, a therefore surprising that under the more favour- time by the westward march of the Assyrian when the old gladness of Israel's faith was ed upon a gloomier sense of divine anger, the idea sacrifice of one's own son, as the most powerful of rite, should have taken hold of those kings of Ahaz and Manasseh, 2 Kings xvi. 3, xxi. 6; who between priests, in their hopeless need of help from religion of Jehovah, to look to strange peoples' rite. Ahaz' sacrifice of his son (which noted a somewhat late authority) must have been an act of despair, human sacrifices are not an ruptions of the popular religion spoken of and Micah. But in the 7th century, when the old had assumed rude hardness, and all religion was ned into cruel fear (Micah vi. 7), before the Micah the example of Manasseh spread to ple, and Jeremiah and Ezekiel make frequent and nt reference to the "high places" for the sacrifice dren by their parents which rose beneath the very t the temple in the gloomy ravine of Hinnom ley (Jer. vii. 31 f., xxxii. 35; Ezek. xvi. 20, 57). It is with these sacrifices that the name of Moloch is always connected, sometimes "the bomb" appears as a synonym. At the same time, rid ritual was so closely connected with Jehovah (Ezek. xxiii. 39) that Jer. might more than once necessary to protect that name of Jehovah- on (Jer. xxxi. 31, xix. 5). So too in the idea of ng the firstborn to Jehovah that is declared and l in Micah vi. It is indeed plain that such a for we have here to do, not with human victim- cal, but with the sacrifice of the dearest earthly ings could only be paid to the supreme deity, and ople never ceased to acknowledge in Israel, though they sought to make sacrifices by the adoption of foreign the which Jeremiah, and after him 2 Kings xvi. 3 a single letter

that Micah everywhere the offering the expression "to Moloch," is rather the other sacrifices) of children and justify the

"(Gen. ii. other men" is of too late to Moloch in old Israel. sacrificial consecration of criminals or [illegible] neighbours (alone of sacrifice in which the child was burnt through fire and Topheth is elsewhere; its meaning LXX. o.

the legislation of Leviticus and the author of Kings to mark out the Moloch or Baal as a false god, d from Jehovah, is precisely parallel to the way in Hosea speaks of the golden calves or Baalim. In ease the people thought themselves to be worsh Jehovah under the title of Moloch or Baal; but the p refuses to admit that this is so, because the w itself is of heathenish origin and character. Moloch," in fact, like "the Baal," is not the proper of a deity, but a honorific title, as appears from the the article with it. According to the Hebrew conso it might simply be read "the king," which is a co appellation for the supreme deity of a Semitic st tribe.[1] And so the LXX., except in 2 Kings xxi and perhaps Jer. xxxii. 35, actually treat the name appellative ("ruler," "rulers"). The traditional pron tion, which goes back as far as the LXX. version of (Μολόχ), appears to mean "the kingship"—an unus sense, which lend probability to the conjecture th old form was simply "the king," and that the later gave it the vowel of בשת, the contemptuous nam Baal (G. Hoffmann in *Z. f. A.W.*, 1883, p. 124).

From these arguments it would appear that the Moloch worship does not imply the introduction in religion of Judah of an altogether new deity, but heathenish development of Jehovah worship, in the fa fashion of religious syncretism, and under that s the inadequacy of the old popular ritual to dive wrath of the Godhead which was inspired by the cala of the nation in the 7th century B.C., and led to mor one new development of atoning ritual. The key phenomenon is to be found in Micah vi., not in an of mythological speculation as to the forces of natur as is supposed in Movers's theory that Moloch rep the fiery destructive power of the sun. Moloch, i in the Old Testament has no more to do with fir any other deity. The children offered to him we burned alive, they were slain and burned like any holocaust (Ezek. *ut supra*; Isa. lvii. 5); their bloo shed at the sanctuary (Jer. xix. 4; Ps. cvi. 38). the late Rabbinical picture of the calf headed brazen of Moloch within which children were burned alive fable, and with it falls the favourite comparison b Moloch and the Carthaginian idol from whose braze children were rolled into an abyss of fire, and Diodorus (xix. 14) naturally identifies with the chil Kronos, thus leading many moderns to make Mol planet Saturn. On the other hand, the Massoret of 1 Kings xi. 7 makes Moloch (without the artic name of the god of the Ammonites, elsewhere Melcom or Malcam. But in this place the LXX. tran certainly found the longer form מלכם in their M the Hebrew still reads in verse 33), while it is plai 2 Kings xxiii. 10, 13 that the worship of Milcom shrine set up by Solomon was distinct from the later Moloch worship of Tophet. In the usual text of the LXX., indeed, this distinction is not m 2 Kings xxiii., but this is an error of the Roman e the Vatican MS. really reading MOAXOA in verse (W. R

LYBDENUM, one of the rare metallic elements l for atomic weight, Mo 96. It occurs in chiefly in the two forms of Yellow Lead Ore oO$_3$) and Molybdenite (MoS_2). The latter mineral similar in appearance and in mechanical properties hite or black lead, and in fact, was long confounded chemically, until Scheele in 1778 and 1779 proved ifference by showing that only the mineral now nolybdenite yields a white earth on oxidation, etallic radical of the earth, after its discovery by was called molybdenum, from *μόλυβδος*, lead.

ating molybdenite in a combustion tube in a stream of ox- n the trioxide MoO_3 (molybdic acid), which collects in e. The substance, when heated to some moderate degree, thout much volatilization into a yellow liquid which on freezes into a crystalline radiated mass of 4·69 specific It dissolves in 500 parts of cold and in 900 of boiling It dissolves readily in aqueous ammonia or alkali forming *molybdates*. Like silica, it combines with bases in several of proportions. Of the ammonium salts, a mixture said of position $3(NH_4)_2O, 4MoO_3, 4H_2O$ (known in laboratory simply as molybdate of ammonia) is the most important g, as it does, the most delicate, characteristic and widely- le precipitant for ortho-phosphoric acid. To detect phos- ed in any substance soluble in water or nitric acid, add solution of molybdate of ammonia in excess of nitric acid n (not too much) of the nitric solution of the phosphate p the mixture at 40° C.; the whole of the phosphoric y separates out in the shape of a canary-yellow crystal- ate of "*phospho-molybdate of ammonia*," of the composition

$$\left.\begin{matrix}24MoO_3.P_2O_5.3(NH_4)_2O \\ +24MoO_3.P_2O_5.2(NH_4)_2O\end{matrix}\right\} + 10H_2O$$

ng to Gibbs), which is insoluble in the strongest even in e of dilute nitric acid, but soluble in excess of phosphoric ment of this complex ammonia salt with aqueous ammo- le its acid $24MoO_3.P_2O_5.3H_2O$ nd crystallizing from this solution with 9 molecules of

phospho-molybdic acid plays a great part in chemical being a generically characteristic precipitant for all sorts of s, which combine with it, pretty much as ammonium do cipitates insoluble in dilute mineral acids. A solution of l sufficient for this purpose may be obtained by adding te of soda solution with molybdic acid adding phosphate one part for every five of MoO_3, evaporating to dryness dissolving in water, filtering, and adding nitric acid until id becomes yellow.

llic molybdenum is obtained by reduction of the trioxide in n gas at very high temperatures. It is thus obtained in rystalline granules which are infusible even in the oxy- n flame. An alloy of the metal with four or five per cent. of carbon (formerly accepted as molybdenum) fuses in the oxy- hydrogen flame into a silver-white metal, of 8·6 specific gravity which is harder than topaz (Debray).

Analysis. Molybdenum in all its forms is readily converted into molybdic acid by oxidizing agents, such as nitric acid, or alkalies volatile forms into alkaline molybdate by fusion with carbonate of alkali and nitre. Alkaline molybdate is soluble in water, a solution, on gradual addition of hydrochloric acid gives first a white precipitate which then dissolves in the excess of acid. When pieces of zinc are added to such a solution, the latter gradual reduction of the MoO_3 to lower oxides, at once first a blue then a green, and lastly a deep black-brown colour. Molybdic acid colours the blowpipe flame yellowish green. It dissolves in borax, forming a bead which in the oxidizing flame becomes yellow in the heat, but almost colourless on cooling; the reducing flame colours it dark brown and opaque. See the operation of the Duke of Modena.

MONACHISM

THE word Monachism, or Monasticism, primarily meaning the act of "dwelling alone" (μοναχός, μοναζειν, μόνος), has come, by an easy and natural transition, to denote the corporate life of religious communities living a life of poverty, celibacy, and obedience, under a fixed rule of discipline. The root-idea of monachism, in all its varieties of age, creed, and country, is the same — namely retirement from society in search of some ideal of life which society cannot supply, but which is thought attainable by abnegation of self and withdrawal from the world. This definition applies to all the forms of monachism which have left their mark on history, whether amongst Brahmans, Buddhists, Jews, Christians, Moslems, or the communistic societies of the present day, even when theoretically anti-theological.

This broad general conception of monachism is differenced in the following ways. It may take the form of absolute separation, so far as practicable, from all human intercourse, so as to give the whole life to solitary contemplation — the anchoretic type; or, contrariwise, it may seek fellowship with kindred spirits in a new association for the same common end — the cœnobitic type; it may abandon society as incurably corrupt, as a City of Destruction out of which the penitent must flee absolutely (the Oriental view, for the most part); or it may consider itself as having a mission to influence and regenerate society — which has been, on the whole, and with minor exceptions, the Western theory of the monastic life.

The question has been warmly debated whether monachism be an evil or a good, whether a natural, perhaps a necessary, part of Christianity (as being, indeed, the strictest logical issue of the triple vow of baptism, literally construed), or a foreign element introduced into it with unfortunate results, and rather an excrescence on its system than an orderly and healthy development. Unlike many other institutions which have needed the lapse of centuries and the gradual approach of decay and degeneracy to show their weak places, monachism in its Christian form displays some of its most unlovely features while yet almost in its cradle, whereas not a few of its best achievements belong to a late period in its history, and it has throughout displayed a singular elasticity and power of taking a fresh departure, after seeming to have exhausted its energies. Its champions and its opponents have thus always had ample materials for their brief, and there is little probability of the controversy ever coming to an end. But the most philosophical mode of viewing its relation to Christianity is to recognize that monachism has made a part of every creed which has attained a certain stage of ethical and theological development, that there is a class of mind for which it has always had a powerful attraction and which can otherwise find no satisfaction; and consequently that Christianity, if it is to make good its claim to be a universal religion, must provide expression for a principle which is as deeply seated in human nature as does any other, albeit limited to a much smaller section of mankind.

Three causes seem to have combined to produce the phenomenon of monachism in early Christianity, each of them set in motion by the general dissolution of morals in the pagan society of the time, of which we get a sufficient glimpse from the Christian standpoint in the first chapter of the Epistle to the Romans, and from the pagan standpoint in the sixth Satire of Juvenal. These three factors were (1) the Oriental tendency towards retirement, contemplation, and asceticism, influencing the infant Christian church through the agency of the Jewish ascetics, the Essenes and Therapeutæ, who had begun long before the Christian times both the solitary and the common life in Palestine and Egypt, and who probably contributed many converts to Christianity, and became practically merged therein when they disappear from history in the first century of the Christian era; (2) the Hellenic teaching of the Alexandrian Neo-Platonists on the purification of the intellect by abstraction from physical indulgence; and (3), perhaps a more powerful influence than either, that old Roman sense of austerity and discipline which, while looking back sorrowfully to the memories of the simpler habits of republican times, could find nothing amidst the social luxury and administrative weakness of the decaying empire which suited its ideal, save the monastic system with its proscription of luxury, and even of comfort, in every form. The first named of these three factors was, however, probably the earliest to operate. The Scriptures attest clearly the existence of a body of ascetics in the persons of the Nazarites, leading always for a certain period, and sometimes for life, a stricter existence than the ordinary Jew; and John the Baptist furnished examples of the solitary hermit type. The Schools of the Prophets at least seem to have been celibate and cœnobitic communities, living under a fixed ascetic rule; and it is familiar to all that such was the actual discipline of the Essenes (see ESSENES). These, with the Therapeutæ, known to us only from the book *De Vita Contemplativa* (ascribed to Philo), and described as existing, though not exclusively, established in Egypt, bore a close resemblance to the Essenes, differing from them for the most part by greater austerity in the matter of food, and by their preference for the solitary life over the cœnobitic fellowship of the Essenes; for their custom was that each member confined himself to his lonely dwelling (called by the afterwards famous name of *μοναστήριον*) throughout the week, while all assembled on the Sabbath for worship, and for instruction from the senior of the community. So closely does this polity resemble that of several of the earliest Christian societies of the kind that Eusebius devotes a chapter of his *Ecclesiastical History* (ii. 17) to asserting their identity, holding that Philo could have been speaking of none save Christian ascetics, a view in which he is followed by Sozomen and Cassian in ancient times, as also by many moderns. This view has been rendered much more probable by recent inquirers, who seem to have made out that the *De Vit. Cont.* is spurious, and written about 300 A.D.;[1] for there is a general agreement amongst the fathers that the monastic life did not exist till nearly two hundred years after Philo lived; and Tertullian (160-240 A.D.) declares explicitly that Christians in his time did not withdraw *from* society. "We are not Indian Brâhmans or Gymnosophists, dwellers in woods and exiles from life; . . . we sojourn with you in the world" (*Apol.*, xlii.). Yet there is no reason to doubt that the leaven of Essenism was at work in the Church from the earliest time, and helped to form the atmosphere which issued in monachism. Still, the process was slow and gradual, passing through very much the same stages as can be traced by careful inquiry in the case of the Essenes. That is to say, the new converts to Christianity, being for the most part dwellers in cities, were in need of close and daily contact with the heathen society around them, whose relaxation was such as to induce an even greater recession from the habits of self indulgence than the stricter morality of the new creed enjoined, so that a body known by the name of "Ascetics" sprang up very soon within the church

[1] See especially Lucius, *Die Therapeuten*, 1879.

were urged on to still greater severity of life when the rapid progress of Christianity brought large numbers of merely nominal converts in, whose practice fell too conspicuously below their profession. The desire of protest against such a state of things led to the gradual separation of the devotees into a kind of order within the main body, and to their actual withdrawal from habitual intercourse with their less strict fellows, which led in turn to their departure from the towns into more secluded places, even before any formal conception of the monastic life had shaped itself in their minds. But the first glimpse obtainable of the "common life," and that only an indistinct one, is in the New Testament, and applies to women alone. There is mention in the pastoral epistles (1 Tim. v. 9 12) of a class of widows, apparently not as mere recipients of relief, but as constituting an ecclesiastical grade; while in Acts ix 39 it appears as if a number of women belonging to the order were united in some kind of community under the headship of Dorcas, for the narrative rather implies that they were her assistants in making clothing for the poor than themselves the objects of her bounty. This conjecture receives some confirmation from the mention of "the virgins who are called widows" (*τὰς παρθένους τὰς λεγομένας χήρας*) in the shorter recension of the Ignatian Epistle to the Smyrnaeans, and from the statement of Athanasius that Anthony, when himself about to begin the solitary life which he is regarded as having instituted, first placed his sister in a convent of virgins (*παρθενῶνι*), a fact which proves the organization of women at an earlier date in community life than of men, and lends some probability to the notion that it may have begun very soon and ed, especially when the prominence given to the virgins as a separate and seemingly long-established order in the church by such early writers as Tertullian and Cyprian is borne in mind.

Two other causes must be taken into account as tending to stimulate monachism when once it began. First is the theological opinion, early formulated, and never since without many advocates, that two distinct standards of life and holiness are set forth in the gospel, that of precept, and that of "counsels of perfection," the former binding all Christians without exception, the latter being voluntary, and merely offered for acceptance to such as aim at especial sanctity. The second, and even more powerful, agent was Gnosticism, not only in its earlier forms and in the kindred spirit of Montanism, but still more in its Manichaean development, when its dualism led to exaggeration of the antagonism between flesh and spirit, and the human body was regarded no longer as a servant to be trained, but as an enemy to be crushed and beaten down with unrelenting hostility. But in every age of monachism, from the earliest to the latest, social disorders and insecurity have proved the chief feeders of the cloister, never widely popular in times of healthy and orderly national life, but eagerly resorted to as a place of shelter from social turbulence.

There are five main classes of monastic institution, each of which approximately marks a new departure in the history of Western monachism (for the East has never had more than the first), as they succeed one another in chronological order, without in any instance involving the abandonment of the previous foundations. They are (1) Monks; (2) Canons Regular; (3) Military Orders, (4) Friars; (5) Clerks Regular. All of these have communities of women, either actually affiliated to them, or formed on similar lines.

There is no doubt as to the time and the person, when, and by whom, the first decisive step was taken which left a marked interval for all time between those ascetics who continued to live in family life, if not really part of it, or who at least dwelt close to some ordinary church, to which they resorted habitually, and the seekers after some more retired and separate mode of life, whether singly or in communities. During the stress of the Decian persecution (249 250 A.D.) Paul, a native of the Lower Thebaid, born of wealthy parents about 228, was denounced by his brother-in-law to the authorities as a Christian, and fled for safety to the desert, where he established himself in a cave shaded by a palm tree, and with a spring of water close by. There he remained till extreme old age, dying, if we may accept Jerome's chronology, in his hundred and thirteenth year, about 342. Although he did not collect any band of disciples around him, nor even, so far as is recorded, attract any casual visitors, except his more famous successor, Anthony, who is alleged, in a narrative containing many legendary details, to have had an interview with him when himself a very old man, the day before Paul's death, yet there seems reason to believe that the fame of his example spread sufficiently to induce imitation of it, and that anchoretic cells began to be set up sparsely in the deserts even before Anthony adopted that mode of life. Anthony's career differed in various respects from that of his precursor. In the first place, it was voluntary choice, not fear of persecution, which sent him into solitude. He was born about 250 at Coma in Upper Egypt, of wealthy Christian parents, and was left at eighteen years of age in possession of a large fortune and of the guardianship of a younger sister. He had received what was probably a fair vernacular education, but distaste for study or perhaps more probably that difficulty which contemplative intellects experience in the acquisition of language left him unacquainted with Greek or Latin, yet the intimate knowledge of Scripture which he afterwards displayed cannot be satisfactorily accounted for in any other way than as the result of attentive perusal, since mere listening to the lections in church would suffice to convey it; and we must reject therefore Athanasius's statement of his ignorance of letters to denote the absence of culture not as implying actual illiteracy. One day, hearing the gospel read, "Go and sell that thou hast, and give to the poor, and come, and follow Me," he took it as a direct address to himself, and at once returned home, distributed his property amongst his neighbours, reserving only a small sum for the support of his sister whom he placed in charge of some Christian virgins, and then betook himself to solitary life, first visiting the most eminent ascetics or anchorets he could find, in order that he might learn the peculiar merit of each and imitate it. He fixed his dwelling first in a tomb, then in a ruined fort near the Nile, where he remained for twenty years, leaving it but once in 311, to encourage the Christians of Alexandria during the persecution of Maximin; and lastly in a small grove of date palms, a few miles west of the western coast of the Red Sea, near the base of Mount Kolzim, where he made an enclosure and planted it as a garden. He quitted his retirement but once in his remaining life, when he again visited Alexandria in 335, at the request of Athanasius, to preach against the Arians. Yet his fame drew not only frequent visitors to his cell, but numerous disciples and imitators around him, attracted not alone by his personal virtues, but by his cheerful and courteous manners and shrewd practical judgment. He made the solitary life honourable and popular, fully justifying Jerome's phrase in comparing him with Paul, "Hujus vitae auctor Paulus, illustrator etiam Antonius." When Anthony died in 365, aged one hundred and five, the desert was already studded with hermitages in every direction, and the second great step in the development of monachism had been already taken by Pachomius, who stands out in history at once as the founder of the cœnobitic life among Christians and as the author of the first formal monastic rule. Born about

nverted to Christianity in early manhood while in the army he was baptized on obtaining his dis- and at once adopted the ascetic life under the n of the hermit Palæmon, with whom he retired ome and land on the Nile, between Faoûoot and eh. Here he began his new institute, whose dis- rs' features were as follows. The monks were t small cells, each of which contained three inmates, on the relation a *monk* (the usual number in Egyptian foundations was two in each cell, while in e tenant had no partner). A large number of such s stood near each other, named a *Lavra*, and each n had but one common place for meal and other ne. Work and food were apportioned to each according to his physical strength, and such as rmitted exceptional fasting or mortification were not stake the heaviest tasks of bodily labour. Their es to be a close linen tunic with a white goat-hair or upper garment, which they were not to exchange s or mend, but only when they are entitled to the t, when they wore their hood only in addition to They were divided into twenty-four companies nbered according to the letters of the Greek l, into which they were distributed according to ellectual and practical proficiency, the first intelli- ones placed in the *Alpha*, the latest of simple fellow- able (in the *Zeta*), the next complicated. Each s was enjoined to recite a set of ten and a hundred s during meal and ceremonies, and all subject to the who was himself in turn when the ex-penitent ond remained subject to the correction for Arche- or the mother-house which the founder of each s to be served by a steward (*oikonomos*) who was ompatible with the treasurer or steward of Tabenne. nd food was bread and water, their luxuries oil d a few cooked dishes of vegetables, chiefly fruit of neighbourhood in which they ate in great silence s broken by the voice of a reader, appointed to ctures from Holy Scripture. Each man's scrip he covered to hold his dates from his companion- nabled twice daily to recite prayers and not for communion on Sundays and Saturdays. A ubation of three years was required of postulants n upon during which they were exercised in simple labours, and were not permitted to enter upon tacy till they had satisfactorily passed through n. Their work was subservient to their own immediate nd weaving mats or baskets for sale, to procure e for the; their direct labour was to attend to , and, at times went on, other handicraft were d in the cloisters, such as those of smith, tailor, lder, farmer, and so forth. Pachomius ordained to found a convent of nuns governed by very rules, and subject to the authority of a visitor d by himself, a superior of the whole to future the rule of the Pachomian rule that before der died (between 318 and 320) he had no fewer ateen hundred people in his own coenobium, and ous and dependent under his authority. Nor was ence confined to Tabenne and its dependencies carried the rule into the Nitrian desert, where n-and-monk were soon collected. Hilarion bore Syria and Palestine. Its tablets of Schnudi into a, Ephraem Syrus into Mesopotamia, Basil the Great ppadocia and Pontus (though a rule of his own supplanted it later on), and, above all, it was brought ma ms himself into Italy, whence it spread over st till modified in various ways by subsequent legis- nd finally displaced by the Benedictine institute. h was its popularity during as it did a need of the time, that its votaries in Egypt alone amounted by the 5th century to more than a hundred thousand, of whom three-fourths were men. This rule has come down to us in two very different forms: an earlier and probably original one, preserved for us in the *Historia Lausiaca* of Palladius, bishop of Helenopolis (367-430) - a great storehouse of details on Egyptian monachism, which is very brief, and has been summarized above - and a much longer recension extending to 194 heads or chapters, preserved in a translation by Jerome, in whose time the monks governed by it had increased to fifty thousand. It had not, however, a complete monopoly, for there were also similar rules in local use, going by the names of famous ascetics such as Paphnutius, Macarius, and Serapion; nor was it uncommon to find communities where in two or three different rules were followed simultaneously by the various inmates. The rule of Basil, however, proved to the East what that of Benedict did to the West, in that it practically absorbed or supplanted all its predecessors, while, unlike the great Western reform, it has had no subsequent competitors, and remains to this day the single monastic code of the Oriental Church. This rule is embodied in the *Asceticon* of Basil, and also in two recensions, a longer and a shorter one, of the actual body of his code, which are marked with not a little of the shrewd practical sense, as well as lofty piety, which characterized the founder, being especially noticeable for their discouragement of the solitary mode of life, and for their recommendation of labour. The development of Oriental monachism thus coincides with the Basilian rule, and there are only two seeming exceptions to this fact: the institution of the Acoemeti (*akoimetai*), or "sleepless" monks in the 5th century for the purpose of keeping up unbroken prayer day and night - a system copied much later in the West by the communities founded for "perpetual adoration;" and the erection, for these very monks, of the great monastery of the Studium at Constantinople (named from Studius, its founder), which was the Cluny of its time and country, as a centre of the more intellectual monastic life, and as the model of stateliness in ecclesiastical ceremonial.[1] Greek monachism, as an institute, has no history later than the 5th century. The monks indeed constantly appear as factors in the controversies of the centuries which followed, at once the polemical and the political disputes showing them equally fierce and eager partisans (notably in the Iconoclastic controversy, which found them the most ardent champions of images); but they cannot be said to have exerted much influence upon society till a very late period of their history, when they were instrumental in keeping the national spirit and the national religion alive in Russia when suffering under the Tatar yoke, and they performed a like service for Greece during the centuries of Turkish oppression. It may further be added that, however low the intellectual life of Eastern monasteries may appear when judged by a Western standard, the clergy who are trained in them, technically known as the "Black clergy," stand much higher in character, acquirements, and general influence than the secular or "White clergy" of the parishes, whether in Greece or in Russia.

It has been already mentioned that the bad side of monachism appears almost as early as its good side.

[1] The great abbey, at the height of its prosperity, contained more than a thousand monks, and the following list of its staff of officers, due to Theodore the Studite, may be usefully compared with the Western monastic hierarchy: Ἡγούμενος (abbot), ὑποσταλτικός (prior), οἰκονόμος (treasurer), ἐπιστημωνάρχης (ceremoniarius), ἐπιτηρητής (inspector), κανονάρχης (precentor), ταξιάρχης (seneschal), κελλαρίτης (cellarer), ἀριστητάριος (refectioner), βεστιάριος (sacrist), ἀφιπνιστής (vigilator), νοσοκόμος (infirmarer). One or two of the offices do not quite correspond in East and West, but the general resemblance is close.

he system won the admiration of all the most emi
ristian teachers of the age which saw its birth and
owth, and while we are met by a still more remark
t that from the time when monachism was fairly
ned till we enter on the Middle Ages there are
or three names of distinction amongst the clergy,
as writers or administrators, to be found outside
s of monachism, amongst whom the most famous
basil and Leo the Great, nevertheless, there is
account on the other side. Not only did the
speedily find itself encumbered by the Messalians,
s, Gyrovagi, Sarabaites or Remoboth, Circumcel
and other companies of professed ascetics, whi m
, vagrant in habits, and turbulent in conduct, but
e genuine societies had scarcely fewer faults to
s. Lay in their origin, and for the greater part
earlier history having but rarely occasion to
them (a single priest ordained for each monastery
ter to its inmates being the utmost allowed for a
sible time), they were not subject to the same direct
on and discipline as the clergy, in case a whole
ity chose to disregard its rule, though of course it
to deal with an offender who had the force of he
y against him. The clergy were subject to the
ontrol of the bishops, and many disciplinarian canons
ils had laid down rules for their conduct ever the wa
e with the monks for a considerable time, not
ver effectively in the East, and their lax character
n practical independence of any authority except
abbot. And, despite the strictness of the monk
le itself, which, even before actual vows were
ntroduced (probably on the recommendation of
always involved during compliance with it the
gagements to the observance of poverty, chastity,
dience, which make up the triple of the monastic
s, and though pains were taken to exclude unfit
ts (such as criminal slaves who had fled for re
e than ill treatment, or persons who had kindred
nt on them), while a long probation was exacted
l who were accepted, yet it was impossible that
an a small proportion of the many thousands who
in during the first enthusiasm for the new move
ould have had any real sympathy with the re
and aspirations of such a mode of life. Severe
m operates differently on different natures, and
here are some whom it does but discipline and
here are more whom it tends to coarsen and to
, even apart from the many whom it is apt to
th morbidness, if not actual insanity. And it is
ionable that vast numbers of those who entered
monastic life came from the poorer classes, in
f some less toilsome mode of existence than they
viously led, preferring the contemplative societies,
almost no labour, certainly none of a severe and
ast, was practised, to those where agriculture and
tive employments, requiring more energy than net
ket weaving, were enjoined. Such men, undisci
d undisciplined, were liable to be thrown entirely
gear by the complete revolution in their mode of
specially when the community they joined was not
ntemplative, but situated in some place where the
ful soil made tillage nearly impracticable, and the
nbers crowded together were far too numerous for
s which could be assigned them. From the bosom
societies came not only single examples of exagger
ritual pride, bitter fanaticism, avaricious greed of
ty articles whose usufruct was permitted, fierce
ty, and wild religious delusions, but they gave
companies like the *Βοσκοί*, or "grazing monks,"
potamia and Palestine, who roved about, shelter
less and nearly naked, as Sozomen and Evagrius tell us, in
the mountains and deserts, grovelling on the earth, and
browsing like cattle on the herbs they casually found; and
to those fierce band of Nitrian and Syrian ascetics who,
reared in the narrowest of schools, treated any divergence
from their own standard of opinion as a crime which they
were entitled to punish in their own rectors fashion, two
instances of which have left an indelible brand on their
history—the murder of Hypatia in Alexandria, and that of
the patriarch Flavian at the Robber Synod of Ephesus. An
equally insular, but more sporadic and temporary, form
of asceticism was that of the Stylites or Pillar hermits
(στυλίται, κιονίται), who followed a fashion first set by
Simeon, a Syrian monk who spent almost half of the 5th
century on the summit of a column 60 feet in height.
The unwonted kind of austerity at first gave rise to strong
opposition, even from hermit themselves, and a messenger
was sent to Simeon, bidding him in the name of a synod
of bishops to descend from his pillar; but with infinite
tact he managed to persuade him to remain, and he showed himself ready
to comply. So he proved to be the saint, and, having thus
at once them selves that he was not influenced by spiritual
pride, they left him to follow his own devices. And we
have the direct personal testimony of the wise and tem
perate Theodoret that he exercised a strong and salutary
influence over the nomadic Saracen tribes, converting many
hundreds and even thousands to Christianity, he also became
the shrewd and trusted adviser, not only of the peasants
who flocked to be near him, but of Arab princes, Persian
satraps, and even Roman emperors. He cannot be
judged, therefore, by ordinary standard, and it is more
than likely that a life so extraordinary made on his world
at least as much for good, but as the only
contact before us the class to which he belongs, and the
to know he was liable and to have died out with his man
ners, the vermicular Simeon a century later. Even when
the hermit-ideal of monachism appeared in Egypt
and Syria it was upon and the full weight is allowed
to the contemporary picture drawn by great Christian
writers of the time, as ideal of a philosophy true
and purer than that of the Porch or the Academy, as
place where the equality and brotherhood not merely dreamed
of but established fact on the outer world could be seen in
being, as an asylum where children, deserted by their parents or
otherwise orphaned, were carefully reared, where the rich
were heavily taxed, where talents, piety, and gift for
godliness were the rule of all, it must be confessed that
the complaint of the Government, embodied in the hostile
legislation of the emperor Valens in 365, objecting
monks to the corruption (which drew forth an indignant
protest from Christians, that monachism was injurious
to society and to the healthy condition of civil life by
drawing off so large a fraction of the population into the
backwater of the cloister, was perfectly well founded.
And no small part of the overthrow of Christianity in
Egypt and Syria by Islam is due to the practical with
drawal of all the devout from family and public life, leaving
no spiritual energy to cope with the Koran in the town
and village—whether the conquering Arab came to civil
and proselytize.

The history of monachism in the West is far more varied
chequered, and interesting than in the East. It takes
its beginning from the visit of Athanasius to Rome in
340, during his second term of exile, when he brought
with him his *Life of St Anthony* and produced the example
on the Roman Christians who mourned a pattern not less
than as devotees, over the lax and enervated habits of
society. The popular imagination was caught at once,
and not only was the basis of monachism successfully laid
in Rome itself, but Eusebius of Vercelli introduced it

rthern Italy, where it was fostered a little later illustrious Ambrose at Milan. From the very ng a marked difference shows itself in the spirit of monachism as compared with the parent institute East. Partly from dissimilarity of climate, but still om that of racial and national temperament, there ay been less tendency in the West to either abstract plation or severe self torture, such as is equally to many of the Egyptian or Syrian ascetics and Jogis of Hindustan. Hard work, with due inter food and recreation, occupied all that part of a monk's time which was not devoted to prayer or and a careful apportionment of his duties through day gave each hour its appointed task to be ful aving very few loose ends of time to be wasted. ne that the Basilian rule aimed at the same end, t a very minute time table form a part of other n code , but, as already remarked, the work ther had enough not abundant enough to provide healthy labour, or to occupy the mind sufficiently t from vague speculation or morbid brooding dur hours of so called toil. From this fundamental ess springs the broad distinction between the two the monastic life, in that the West did not merely shelter for such as felt unable to endure the storm world, leaving secular society to take care of itself it could, but, contrariwise, employed the cloister as a training school for the strong, as the stand whence to work the lever which moved a world. he more remotely secluded monasteries of the West, of serene, as refuges where in the inmates might lly cut themselves off from all intercourse from t, were rather military outposts and frontier fort lization, which taught the arts of peace, the pro of agriculture, and at least the rudiments of social ty, to the rude and almost nomadic hunters and s, of whom many of the wilder tribes in outlying s consisted. And if such was the case even where nditions seemed but favourable, it may readily be stood what an ample field for exertion the more regions provided

would seem that it was some modification of the nian rule which first made it way into Europe, e interest excited by the movement led to variety on the part of the teachers who opened at Spalato hence in Italy. Thus, Eusebius, abbot of Vercelli ly near Ravenna), translated the Basilian rule into and it soon took root in southern Italy, where it nd to hold its ground for a considerable time. more important part in the propagation of the ic institute in the West was taken by Jerome, who spending a considerable time, beginning in 374, a hermit in the desert of Chalcis, and later at ntinople, returned to Rome in 382, where he ecretary to Pope Damasus. He acquired much ce over a distinguished group of Roman ladies of social position, the most celebrated of whom are and her daughters Blesilla and Eustochium, and ved that influence in urging the adoption of the tic life upon them. Blesilla died early, it was said chevied in consequence of austerities pressed upon hich her constitution was unable to bear, and the ularity which the report brought upon Jerome, tating with the death of his patron Damasus and enuses, drove him back to the East, whither Paula Eustochium also betook themselves, finally settling in Bethlehem, where the elder lady built three con- of one of which she was superior, while Jerome, who ly erected a monastery for monks in the immediate y, acted as chaplain and director to the community. As the taste for pilgrimages had already become d rooted, the convent at Bethlehem was ere long a favo resort of pilgrims, and exerted considerable influen prompting the erection of similar foundations in West. Quite another impulse was given to the fu ance of monachism by Augustine. While, amongs many documents which have been ascribed to him, the one which is of the nature of a monastic code is his Epistle, addressed in terms of severe reproval to the of a convent he had himself founded at Hippo, but had fallen away from discipline, his personal ex gave rise to a new type of the common life, in th formed a sort of college of priests, who shared the epi house with him, ate at a common table, and copi other particulars the observances of monasteries, but out losing their secular character. This was the ori the institute afterwards famous as the Austin Ca foundation of the 11th century. It is true that Eu of Vercelli had anticipated Augustine by collectin clergy of his cathedral (and, as it would seem, the re ing ecclesiastics of the city) into a common dwellin the difference in his case was that he obliged them to the habit and style of monks, and thus was in no sen originator of a new institute. Another important bution of Augustine's to the history of the common he treats in *De Opere Monachorum*, wherein he sets for imperative need of making hard work an invariable of the monastic profession, notably on the groun most of the monks in Africa came from the lower of society, such as freedmen, farm-labourers, and ar who were perpetually injured by being raised into a viewed with more general respect than that from they had sprung, while they were actually subject to privations and lighter employment than they had accustomed to. And he adds that amongst othe consequences of this idleness was that they were tramping the country selling sham relics, which palmed off on the unwary, extorting money in ta tions also, and bringing discredit on their pro by their hypocrisy and vices a picture only too fully repeated by the Mendicants a thousand year the date of this treatise. The 5th century was rapid progress in the spread of monachism in the Chief amongst those who helped to popularize it the name of John Cassian (350-433), a monk of Beth who made a long and careful study of the Eg form of monachism, of which he has bequeathed a able details in his *De Institutione Coenobiorum* an *Collationes Patrum*, the former of which is a treatise monastic life, and indeed virtually a rule, though a what prolix one, mainly derived from Macarius, wh latter is a record of the teachings of some hermits desert of Scete. Both of these works exercised a po influence in their own day, and the second retain repute much longer, having been warmly approve recommended for study by Benedict, Bruno, D and Ignatius Loyola, all four founders of celebrated Cassian fixed himself at Marseilles, where he fou famous monastery of which he was probably abbo which was the centre whence monachism, uniti peculiarities of East and West, was propagated in so Gaul, and notably planted in the island of which became the seat of one of the most e monasteries of the early Middle Ages. Northern had received the institute earlier through the of Martin, bishop of Tours (316-397), who f monasteries near Poitiers and in his own diocese, were soon thronged, so that his funeral was atten two thousand monks. Spain was even earlier in t than Gaul, but there is some obscurity as to the

the introduction of monachism there, all that is certain
ng that it had made its footing good before 380, the
e of a council of Saragossa (Cæsaraugusta) which for-
le priests to assume the monkish habit. Still more
ecurity hangs over the first establishment of monachism
Britain, as to which no trustworthy records have come
vn to us, though all probability points to its importation
n Gaul in some variety of the Pachomian rule; while
rmany did not receive the institute till the following
tury.

t must not be supposed, however, that the principle of
nachism met with no opposition in the course of it
gress. Apart from the opposition of those who disliked
precisely for its merits, for its protest against the
solute morals and enervated habits of a luxurious and
ting society, and for the manner in which it won to
lf many of the noblest and most promising of the
ng and ardent of both sexes, and without taking into
ount the more reasonable objections of statesmen, there
re not lacking warnings of the dangers attending
ggerations of the principle of monachism, uttered by
ne of its most eminent upholders. Augustine's sharp
sures have been already mentioned, and to them may
added the decrees of the council of Gangra in 363,
thereabouts, which anathematize those who adopt a
bate life on the ground that marriage is evil who wear
peculiar dress as a mark of holiness, condemnation such
use ordinary clothing, or who desert their parents or
ldren dependent on them under the plea of devoting to
l an ascetic life. So, too, the great Chrysostom himself a warm advocate of monachism, found himself obliged
teach his flock the sanctity of Christian family life, and
truth that there was often as much selfishness as piety
retirement to a hermitage from the cares and duties of
iety. These arguments and decisions were, however,
ed only at abuses and exaggerations of the monastic
a. It remained for Jovinian and Vigilantius to attack the
ual principle. Their writings have not survived, and
can judge of their arguments only from the account
en of them by their chief opponent Jerome, whose
inent gifts, however, did not include either moderation
controversial fairness, so that it is not safe to assume
t we have all their case before us. As regards
gilantius, he accurately represents the Puritan type of
d protesting against the external part of the popular
gion of his day, often with good reason, but also showing
equal intolerance for harmless, it not useful, practices;
that his condemnation of monachism is only part of his
neral objection to the temper of his time. But Jovinian's
ections seem to have gone deeper. He had been himself a monk (and indeed never resumed secular life), but
disputed absolutely the thesis that any merit lay in
nachism, celibacy, fasting, and asceticism considered in
mselves, save in so far as they contributed to foster the
ristian temper and life, which might and did flourish
ually, he urged, under quite different conditions, while
was by no means unfrequent for spiritual pride, if not
nichæan error, to lay hold of those who devoted themves to the ascetic profession. This was, in fact, going
y little further than Chrysostom had done, or than
us did a short time later. But Jovinian's divergence
m the standard of his day was not confined to practical
estions; it extended to theological doctrines also, and
ordingly his strictures on monachism, probably more
isive and less qualified than those of its other critics,
re involved in his condemnation as a heretic by synods
Rome and Milan in 390. The reaction, of which he
y be regarded as the mouthpiece rather than as the
e representative, was thus effectually crushed, and that
enturies. And though Jovinian is undoubtedly more in accord than his opponents with the modern temper on the subject of monachism, and while it may be true that his teaching might have been a useful corrective in Eastern Christendom, where family life was all but overborne by asceticism, yet the impartial historian must admit that his success would have been an irreparable misfortune for civilization in the West. Such a passionate estimate of asceticism as his, if widely entertained, would have been fatal to the spread of monachism, and thus one of the most important conservative and formative forces in the preservation of the older culture, one of the most powerful dynamical forces in reducing the barbarous materials of early mediæval society to order and coherence, would have been lost to Europe. How it may be asked, what effectual substitute could have taken its place? Even if it was, the movement was not checked for a moment by this partial reaction; and not only did the old monastic communities thrive and spread during the 5th and 6th centuries, but new ones were established, chief among which stand those of Cæsarius of Arles and of Aurelian of Arles in southern Gaul that of Lerins on the islands of the Provençal coast, that of Ledrone in Spain, and the early Celtic ones, of which only traditional fragments survive, but which seem to have been strongly affected by tribal influences. Monastery was often recruited from a single family; the abbacy became hereditary in the family of the founder, a fact which is noticeable even in the case of the abbots of Iona, who for ten generations after Columba were of his family in the tribe of Cinaill Conluain.[1]

But, swiftly as monachism spread in Europe during the breaking up of the Western empire, some of the causes which hastened its progress also tended to its rapid decay. The disturbed state of society, and, in particular, the prevalence of petty warfare, drove many pious persons to seek a quiet retreat in the cloister without more directly religious motives. When once there they found in every place some rule in force which was imported directly from Egypt or Syria, or else, like that of Cæsarius, modelled on Eastern lines, and thus ill suited to the severer climate of Europe and the active habits of the people. The austerities were oppressive for general observance, and led to a widespread neglect of rules which continued in force, while at the same time the very means which seemed to keep them had given rise to a special sanctity in the pretence of their strict way of life. The cry was for a reform, or rather for a wholly new departure in the shape of a rule devised to meet Western needs, not merely adapted more or less clumsily from Oriental ascetism. The task appeared in the person of Benedict of Nursia to be one of the most famous of all monastic codes. Born of respectable family about 480, he adopted the ascetic life at fourteen in a cave near Subiaco, not far from Rome, where he remained for three years, at the end of which he was chosen abbot of a neighbouring convent, then in a very relaxed state. His rule was too strict for his new subjects, who attempted to poison him, whereupon he resigned his office and returned to Subiaco, around which he soon erected twelve monasteries, each peopled by an abbot and twelve monks. Fresh attempts on his life and on the discipline of society drove him out again in the year 529, when he withdrew to his favourite retreat at Monte Cassino, the place where his celebrated rule was drafted in the following year, and which has ever since prided itself on its rank as the cradle of the Benedictine Order and the premier abbey of Christendom. lxx. forbids striking or excommunicating another, without
t's authority, and provides that children, until fifteen, shall
be subject to discipline from all the monks; but any who shall
chastise those above fifteen without the abbot's leave, or be unduly
severe towards the younger, shall be himself punishable by rule.
Chapter lxxi. lays down that the principle of obedience is to prevail
throughout the community, not only towards the abbot or his
officers, but from the juniors towards their seniors. Chapter lxxii.
is a brief exhortation to zeal, and chapter lxxiii. a note to the effect
that the Benedictine rule is not offered as an ideal of perfection, or
even as equal to the teaching of Christ and Paul, but for mere be-
ginners in the spiritual life, who may thence proceed further.

It has been necessary to make this detailed analysis of
the rule, because no mere summary of its general scope
conveys an adequate notion of it, and it plays so import-
ant a part in the history of European civilization that it
is expedient to obtain a clear idea of its detail as well as
of its main outline. The first peculiarity to it meriting
attention is the absence of any severe austerities. Plain
and bare as the food and lodging appear at first to us by
modern notions, yet it is to be remembered that what is
called "comfort" is a wholly recent idea, and even still
scarcely familiar, it may almost be said, out of Great
Britain and its colonies. The scale of living appointed by
the rule secures a greater abundance of the necessaries of
life, not only than was at all common among the Italian
poor of the 6th century, but than is to be found amongst
the humbler peasantry of any European country at the
present day, while even the excluded superfluities entered
but little into the habits of any save the very wealthy.
Next, high thinking, the highest thought of the time,
was united with the plain living as the considerable treas-
land upon reading attests. To this part of the code is due
the great service performed by the Benedictines, both in
the erection of schools, and in the preservation of almost
all the remains of ancient Latin literature which have
come down to us. It made it not only possible but easy
for them to become a learned order, and it is a very
imperfect estimate of the stride forward in this provision
which Milman makes, when he views the injunctions as to
reading as the mere light of expedient to fill up time
somehow. If it were so, the hours for reading would
have been fewer, shorter, and more occasional, merely
rounding off the interval between times of labour, but they
are just as prominent and nearly as long as these. It is
true that Benedict, whose own education had been abruptly
broken off by his early retreat from Rome, did not specu-
latively enjoin the pursuit of learning on his monks; but
they borrowed the idea at once from his contemporary,
the celebrated Cassiodorus, the real founder of monastic
learning, of which his monastery of Vivarium in Bruttium
is the first known school. But the most valuable feature
of the rule is the point or capacity which it assumes to
work. It is scarcely possible to realize at the present day
the dishonour into which toil of all kinds had sunk in the
days of Benedict. Not only had the institution of slavery
degraded many kinds of occupations, but the gradual
disappearance from wide tracts of the yeoman class, ruined and
exiled by the concentration of vast estates (*latifundia*),
or slain in the terrible battles of competitors for empire
or of barbarian invaders, left few save serfs and bondsmen
to till the soil, which the military habits of the invading
tribes led them to contemn any life except that of a
warrior. It is the special glory of Benedict that he
taught the men of his day that work, sanctified by prayer,
is the best thing which man can do, and the lesson has
never been wholly lost sight of since.

The new institute spread with even more astonishing
rapidity than the earlier monachism which it practically
supplanted in the West, and its history, therefore, is,
with one important exception, that of Western conventual
life for some centuries. Moreover, besides marking the
close of the first or tentative era of monachism, when all
kinds of crude essays and experiments were being made,

ng itself the beginning of a new and settled order, he distinction of giving greater dignity and weight female side of monachism than had been the rule y. Numerous and crowded as convents for were in the early church, there is little evidence exercising any powerful influence as a factor in ctual religious life of the time, and though a few of women of eminence, a Euphrosyne or a Macrina, the annals of the common life in the East, yet the Basilian nuns do not play at all so important ecclesiastical history as the spiritual descendants astice, sister of Benedict, for the same flexibility operative control of his rule which made it er for men than its precursors were still more when dealing with the more elastic organization men. Accordingly, the Benedictine nuns offer a ter variety of type than their Eastern sisters, and a much more visible influence upon society, even here newer forms of the organization of women the church were devised which have given it dditional importance. Further, where the most and well-founded objection allowed against monas- that by putting together companies of men and ivers bly from each other, and treating this ercise reli-pea ble condition of the highest kind nt has tended to throw discredit on marriage and ily, and so to weaken society, which is based on ntic alone, a fresh counterpoise can be put in for nedictines. Not merely are they free, as already d, from the anti-social tendencies of Oriental nism, which actually did disintegrate society in best-known institute was the one corrective in the Middle Age of those habits and ideas which tended ade the position of women. The cloister was not the ready asylum indeed for women who had no rm to choose, but it provided the only alternative on to marriage, and that one recognized by public as of even higher distinction and opening to position of influential rank and authority, less ous than the possession of temporal estates, which only serve to attract cupidity, and so invite attack. e of a great Benedictine house was more than l of the wife of any save a very great noble, and, e women were thus not obliged to look to wedlock only path to safety and consequence, they were to mate on more equal terms, and were less likely ewed as the mere toys or servants of the stronger

the special eminence of the Benedictines, in which e without even the semblance of rivalry till the nose, is that they were a missionary, civilizing, and onal body. It is true that the first successful effort st the barbarian conquerors of the empire, somewhat their entrance on that field of labour, and Ulfila the Maso-Goths, Valentinian in Bavaria, and Severi Noricum had achieved much even before Benedict but their work needed to be taken up on a larger in a permanent organization not liable to be ted by the death of any one missionary or group of es. And the task of laying the very foundations ized society, apart from the question of religious ion, was also one never ayed. It was as teacher t for three long ages, even the agriculture, as s of fens and moors, as clearers of forests, as of roads, as tillers of the reclaimed soil, as archi durable and even stately buildings, as exhibiting e type of orderly government, as establishing the rity of peace over war as the normal condition of students in the library which the rule set up in monastery, as the masters in schools open not merely to their own postulants but to the children secular families also, that they won their high place history as benefactors of mankind. No doubt there another side to this picture, even before the order be to deteriorate collectively; but the good actually effec far exceeded the evils which may have accompan it. The Benedictine institute was carried to Sicily Placidus in 531; to France by Maurus, Simplic and then companions in 543, to Spain at a somew later and uncertain date; but did not touch any of Teutonic countries till the very end of the century. T work was chiefly accomplished by another agency, that the Celtic monks, themselves disciples of a Christian presumably carried to Ireland from Gaul, and follow a rule seemingly adapted from that of Pachomius. early history and constitution of Irish and Scott monachism are too obscure to be set down with any c fidence, but it is at least clear that it was mainly tri organization, and even less subject to episcopal autho than the Eastern and Italian forms. The same holds g of the Welsh communities which survived the Sa invasions of Britain. Legend is abundant, trustwor record is scanty, and only a few facts can be rescued fr oblivion. Among them may be included the introd tion into Scotland of a species of monachism resembl that of Augustine, by Ninian, first missionary of southern Picts, who borrowed his institute from Ma of Tours, and set up a cathedral, a house of canons, a school of learning at Whithorn (*Candida Casa*) Galloway before the close of the 4th century, him dying, it is thought, about 432 (Ælred, *Vit. Nin.*). foundation of the second model of Welsh monach (the first has gone below the horizon of history) ascribed to the bishops Germanus of Auxerre and Lu of Troyes, who visited Britain in 429 to combat prevalent Pelagianism, itself a form of opinion due t British monk. They are alleged to have been, directly through their disciples, founders of great monasteries school at Henthland on the Wye, at Llantwit, Llancarv Docwinni, Bangor, Whitland, &c.; while among the m famous names connected with these and similar ho may be mentioned Asaph, David, Illtut, Dubric, Ca Gildas the Wise, and Kentigern, the last-named beir zealous missionary. But Ireland was the true stronghold of Celtic monachism, and before the close of the century was already thickly planted with religious hou Armagh, Clonard, Aran, Lismore, Cluain-edneeh, Clon and, above all, Benchor or Bangor, the famous abbey Comgall, on the coast of Down, near the entrance Belfast Lough, are some of the more conspicuous foun tions, and there are numberless stories recorded of learning, the austerities, and the miracles of their inma The chief interest they have for the student of ecclesiast history lies rather, however, in the colonies they sent f them in their home operations, and it is to the g foundation of Columba (521-597) at Iona, the hiv missions and home of Western learning, more t to any Irish monastery, except Bangor, that the C ried on heathenism is mainly due. The rule of Colum resembles the Benedictine in prescribing three kind employment prayer, work, and reading; while under last-named head not only Scripture but all attain secular learning was included, and it is also certain that work of copying MSS. in a careful and beautiful fash which became so important a part of monastic occupat reached maturity first at Iona. It remains only to sa this connexion that the discipline of Iona, appare borrowed from Irish use, made the abbot supreme,

[1] Published by Dean Reeves in Colton's *Visitation of Derry*, p. and in another form by Haddan and Stubbs, *Councils*, &c., ii. p.

over his monks, as in other rules, but over bishops whose office was simply that of ordaining such as to be promoted to holy orders;[1] they had no rial jurisdiction as rulers, because the monastery, diocese, was the primary local unit in Celtic Chris , and thus a great founder or abbot was of more t and power than a bishop. Another famous pupil monachism, Columbanus, trained at Benchor along is companion Gallus, exercised a powerful influen religious life of his time (543-615), not only founder of important monasteries at Luxeuil, ay, and Bobbio, and as scholar and missionary, but the author of a rule, more severe both in its pro and in its penalties than the Benedictine, with it disputed for a considerable time the field place, hich it might very probably have displaced, had not nedictine institute, as of Italian origin found that at Rome which a Celtic code, became more than ce of divergence from Latin usages, could scarcely

With the mention of another prominent name in t of distinguished Celtic reformers and mi ons hat of Fursey, abbot of Lagny near Paris (c. 650), se this sketch of the Celtic movement in the 6th h centuries, merely adding that its extent and ce may be partly estimated from the number of teries founded in England and various parts of the ent by Irish monks, and the list of Celtic saints rable from the different martyrologies and simila s. The former amount to more than one hundred, ter to nearly three hundred

rning to the Benedictines, the most important event r history after the consolidation of their institute e favour they received from Gregory the Great, f once a monk, who set himself to reform monaste ine, then at a very low ebb save where the new tion was at work. He enacted several regulations e better government of monasteries, such a pro g the admission of any persons under eighteen, g two years' novitiate, enforcing inclosure, treating nishment of monachism with imprisonment for life, nally, in the Lateran synod of 601, exempting teries in all cases from the jurisdiction of bishops (a re due, it appears, to episcopal misconduct and sion rather than to monastic ambition), thereby ing the measure of control which the eighth canon alcedon and the legislation of Justinian I. in 535 ft in the hands of the diocesan, and leaving only ill surviving check, that the bishop's consent was d for the erection of any new monastery. The n of the monk Augustine to England in 596 was, er, destined to produce more immediate and for results than this piece of legislation. It brought monachism into a part of Britain where Welsh hism had been long extirpated, and though little s attended the original foundation at Canterbury, o other houses were destined to be the cradles of hings. Jarrow-on-Tyne, founded by Benedict Biscop, l the illustrious Bede, to whom is due the monastic of York, which in its turn sent out Alcuin to recon European learning under the fostering hand of emagne; Nutcell in Hampshire reared Boniface to be postle of Germany, and founder of one of the most ated and powerful monasteries of the Middle Ages, f Fulda. Nevertheless, decline set in very soon,

and the 8th century was a time of deterioration amongst both the seculars and the regulars. To amend the former Chrodegang, bishop of Metz, instituted in 760 an order of Canons Regular, living by a rule carefully based on and adapted from the Benedictine, with the bishop as abbot, the archdeacon as prior, and with a general likeness in all the details of community life, except that there was no obligation to poverty, and the canons were allowed to enjoy any private property and such fees as they might receive for the performance of their ecclesiastical functions. This rule became extremely popular was sanctioned by the council of Aix-la-Chapelle in 816, and was adopted in most cathedrals of France, Germany, and Italy within fifty years after, besides making some way in England also. It prevailed till the institute of the Austin Canons was substituted for it. And as regards the laity among the regulars at this time, there is extant a very interesting letter from Boniface addressed to Ecgbert, archbishop of York, calling his attention to the excessive number of monasteries in northern England which were conducted without a rule, and were often merely fictitious institutions founded by laymen with the object of obtaining charters of privilege which would exempt them from civil and military burdens, such laymen then assuming without warrant the title and powers of abbots, and filling their houses either with monks expelled from their own convents or with lay retainers induced to receive the tonsure and promise obedience. Boniface call on the archbishop to convene a synod and institute a visitation for the correction of these abuses. The cause of the decline of the monasteries is to be sought in their popularity, which led to their great estates and other kind of wealth, leading to the relaxation of the vow of poverty, which was interpreted as merely forbidding individual property, in the growth of pluralities, and in yet another cause which at first does not seem to lead in the same direction, the growing custom of ordaining monks to the priesthood, thereby attaching laymen, to fit them better for missionary work. But this led, not only to much more intercourse with the society of a lax and turbulent age than suited with canonical rules, but to ambition, as it became customary to fill several sees with monks of a certain abbey. The declension, notably in the habit of the superiors of wealthy houses, had become very marked, when a reformer arose in the person of St Benedict, of Aniane in the modern department of the Herault (750-821), who, in gratitude for an escape from drowning in the Trebia in 774, adopted the monastic life, and changed his name Witiza to that of the great Nursian monk. But he accounted the Benedictine rule too easy, and adopted instead the severest practices of Eastern monachism. He quitted the house of Seine where he had been professed, and betook himself with a couple of companions to Aniane, where by 782 he had built a monastery for a thousand monks, with dependent cells, and collected a considerable library, paying special attention to the acquisition of the rules of the different monastic bodies both of East and West. He was translated by his warm patron, the emperor Louis the Pious, to another house for him near Aix-la-Chapelle, where he acted as in one sense a superior-general and inspector of all the Benedictine houses, and drew up a harmony of all the rules he had collected to aid him in the task of reform. What he actually effected was the practical abolition of most of the competing codes, so as to leave the Benedictine in nearly sole possession, and to procure the enactment of a large body of canons in the council of Aix-la-Chapelle before mentioned, which laid down detailed provisions for the government of monasteries whose very minuteness made them vexatious and ultimately intolerable, so that the reform lasted scarcely two

[1] Bede tells us: "Habere autem solet ipsa insula rectorem abbatem presbyterum, cujus juri et omnis provincia et ipsi episcopi, ordine inusitato, debeant esse subjecti, juxta exemplum doctoris illius, qui non episcopus sed presbyter extitit et monachus" (*Hist. Eccl.*, iii. 4); though, after all, the principle is precisely the Benedictine rule as applied to priests.

ion from its inception. Parallel with the time of de- and partial reform just described was the rise and f the noble and far-sighted school-system projected al machine and entrusted to the superintendence an. Its relation to monachism as distinguished history of education, is that one of its main was the capitulary of 789, which directed that, the primary school attached to each monastery, more important houses were to found and open y ones also, with a higher range of subject, even schools were interior or claustral, and only for or monks and novices, not exterior and free to the public. Several of these schools rose to consider eminency and repute, notably those of Fulda, St Gall, and Rheims, discharging to some extent the s of universities. But the weakness of the later s involved this plan in the troubles which ended reak up of the empire of the Franks, and the 10th saw the end of it. In England monachism shared mon destiny of decay. It had been marked during od known as the Heptarchy by a degree of royal unparalleled elsewhere (for it may almost be said number of kings, queens, and persons of royal s here to betook themselves voluntarily to the cloister not under political compulsion, as often in contry France exceeds the aggregate of those in all untries. Yet it is likely that the fashion set in helped to hasten decay, by inducing many persons the monastic life with little vocation for it to the nd it is certain that secularity (chiefly manifested ccessful dress, protonsure, and drinking habits) became among the English monks of the 8th and the art of the 9th century. The decay was further ated by the spread of the institute of Chrodegang, ished the supply of recruits to monachism proper, a new life of canons regular was preferred. The nce affected the convents of nuns, for an order of ce was established about this time on similar lines. bright spot in the history of 9th century monas- the conversion of Sweden by Ansgar, a monk m the famous house of Old Corbie in Picardy, Albeit Benedictine had been mainly planted by a rom the stricter Columbanian house of Luxeuil, thus kept the tradition of a purer time almost ed.

10th century emphatically the "Dark Ages" or Lead was the time when monachism, both in d West, touched its lowest point. Three causes ted to this in the West: first may be placed the the Northmen; next, the growth of the feudal conventual abbot into secular lord in virtue of held by their monasteries being chargeable with bligations; and lastly, the seizure and impropria- monastic revenues by kings, princes, and bishops. of these causes was at work in the East also, complicated, as we learn from the decrees of a held at Constantinople in 861, by the founda- monasteries intended from the first merely as of pecuniary advantage to the founders, although ces of Greek monks in the conversion of Bul Moravia, and somewhat later, southern Russia, that the cloister had not become quite effete der the conditions of the Byzantine empire in .

the state of things was in the West, even at the of the 10th century, may be learned from the of the council of Trosly, near Soissons, in It speaks of the ruin of many abbeys by the , and of the disorderly condition of many which d. Monks abandon their profession; married lay abbots, with guards and hunting retinue, occupy the dormitories of monks, canons, and nuns; and the rules are universally disregarded. But, as constantly before, so then, reformers were at hand. Berno first abbot of Cluny in France, Dunstan in England, and, somewhat later, Anno archbishop of Cologne in Germany, undertook and to a considerable extent effected, the work of reform. Only the first of these, however, calls for special notice here, and it will suffice to say that Berno, after having been abbot of Beaume, was set by William the Pious duke of Aquitaine, over his new foundation of Cluny in 910, where he speedily initiated a reform of the Benedictine rule, whose very name, and even the memory of the reforms of Benedict of Aniane, had been forgotten in nearly all the so-called religious houses of the time. This new rule is the first example of the establishment of an order within an already existing order, of which it still formed part, many subsequent instances of which occur later. It was stricter than the original code in several particulars, notably as regards fasting and silence; and it laid especial stress on liturgical splendour. Cluny became the head of a large number of dependent houses, and under the government of Berno's successors, Odo, Aymard, Maiolus (who refused the papacy), Odilo, and Hugh I. rose to great eminence, but was nearly brought to ruin by Pontius, abbot in 1109, who was soon deposed, and succeeded by Hugh II., and then by Peter the Venerable who completed the work of drafting the statutes of the new order, begun long before, but not finished, by his predecessors. In his time (1093-1156) the Cluniacs spread over not only the whole of France, but had houses in Italy, Spain, England, Palestine, and in Constantinople itself, and the "Arch-Abbot," as he was called, had more than 300 churches, colleges, and monasteries under his authority. It is enough to say, with regard to Dunstan's reforms in England, that they were directed to two objects, the substitution of monks for secular canons, and the introduction of the Benedictine rule, till then practically unknown in England, into the monasteries, — for the monachism introduced by Augustine belonged to an earlier type.

The 11th century is noticeable for several events in the history of monachism; first of which stands the foundation of the Order of Camaldoli by Romuald, early in the 11th century, a strict community of hermits, living by the system of an Eastern laura of detached cells; but this society has never been of much importance. The Order of Vallombrosa, founded by John Gualbert in 1039, is more remarkable, as being the first to introduce the grade of "lay brothers," which plays so large a part in later monastic annals, the object being at once to open the cloister to a class previously barred by the obligation to recite the office in choir, which necessitated a certain degree of education, and to lighten the strain on the choir-brethren by relegating the rough work of the monastery to an inferior grade of inmates, thus securing more time for reading and meditation for the cultured monks. A series of struggles between bishops and abbots in this century in respect of monastic jurisdiction — the practice having constantly vacillated in despite of Gregory the Great's decision 400 years earlier — issued mainly, though not wholly, in favour of exemption, and the reforms pushed everywhere rehabilitated monachism in popularity. The great stimulus given to the spirit of ecclesiastical discipline and energy by the Hildebrandine movement continued not only during the reign of Gregory VII., but for a considerable time after: amongst its results were the Order of Grammont, founded in 1074, but not transferred to the place whence it is named till 1124; the far more celebrated and influential Carthusians, a peculiarly ascetic

community, established by Bruno at the Chartreuse, near Grenoble, in 1084, which still boasts that it is the only order which has never been reformed on the ground of deviation from its original institute; and the Order of Fontevraud, founded for both monks and nuns (more strictly, canons and canonesses) by Robert of Arbrissel in 1100. Regarding the last named two remarkable facts may be cited: that the founder in 1115 entrusted the superior-generalship of the whole institute to the abbess of the nuns; and that he provided that new abbesses should always be elected from secular women, as having more practical knowledge of affairs and capacity for administration than women trained in a cloister. There is yet one order more belonging to the period of new foundations, of higher note than most - that of the Cistercians, founded by Robert of Molesme in 1098 at Citeaux, near Dijon. This society, chiefly famous as that to which Bernard of Clairvaux belonged, carried its asceticism into a region whence the other monastic bodies had banished it, that of Divine service. The barest simplicity in buildings, church furniture, and worship was enjoined by the rule: plain linen or fustian vestments, iron chandeliers, brass or iron censers, no plate save a chalice and a tube (and those of silver rather than of gold), no pictures, stained glass, or images, and only a few crosses of painted wood, and the most rigid simplicity in chanting, — such was the ceremonial code with which they challenged the costly ritual of Cluny. A more durable innovation was the institution of "General Chapters," to which every abbot of a Cistercian house had a right to be summoned to share in the deliberations held at the chief establishment, and which he was even bound to attend, that, while each dependent house thus obtained a representation in the parliament of the order, it could be called on to render to the central authority an account of its own doings. The Austin Canons, already mentioned, were probably founded at Avignon about 1061, and the Order of Premontré by Norbert in 1120. This society was simply a stricter body of Austin Canons, standing towards them much as Cluny did to the Benedictine. But there are yet two other institutes of this active period which differ from all previous foundations. So far, the new orders are merely modifications, more or less worthy of the original Egyptian system, but the crusades gave birth to two entirely unprecedented forms of monachism — the Military Orders, of which the most celebrated are the Templars, the Hospitallers, and the Teutonic Knights, and convents of women, affiliated to these orders, who were appointed to serve in the lazar houses, hospitals, and similar institutions attached to them, and whose rule, for the first time in monastic history, was drawn up on a distinctly active and not a contemplative basis. Work of the sort had been done long before, but only as a casual accident, not as the primary object of a community.

The military orders arose in a more accidental fashion than any other variety of monachism, being due to the desire felt to lessen the perils which attended pilgrimages to Jerusalem, their almost as much part of the religious craving of Christendom as the hajj to Mecca is with devout Moslems. The Templars were at first designed only as an armed escort to protect the visitors from attack, and the idea of permanent guardianship of the Holy Places did not shape itself till later; while the Hospitallers (afterwards famous as Knights of Rhodes and of Malta, as the main bulwark of Christendom against the Turks, and as maintaining the police of the Mediterranean against all pirates and rovers), borrowed the first idea of their institute from the knightly order of St Anthony of Vienne, founded in Dauphiné about 1095, and devoted themselves originally to tending sick pilgrims at Jerusalem. The Teutonic Knights date from the third crusade, and owe their foundation to the sufferings of the duke of Swabia's army at the siege of Acre, as it would seem that the Hospitallers were unable or unwilling to supply the needed assistance. The knights, when at last the Eastern crusades were abandoned, turned their arms against the heathen of Prussia, which they conquered, as also Livonia, Courland, and Pomerania, besides keeping the Slavonic enemies of Germany in check by frequent raids into Lithuania and Poland, holding their ground as a sovereign order for three centuries, till the Reformation brought about their fall. The common characteristic of all these orders was the union of the seemingly incompatible qualities of the monk and the soldier in the same persons, of the convent and the barrack in the same house. But the contrast was not so sharp to men of that age as it would be to modern ones, for while knighthood was surrounded with religious ceremonies and sanctions on the one hand, and on the other the feudal rank of barons and abbots made them in some sense military chiefs, occasionally even taking the field in person, there was no difficulty in accepting the permanent combination of what was often formerly unduly united. The military orders passed away when their work was ended: the Templars, victims of a great crime, closed by a ghastly tragedy; the Hospitallers, and those Spanish and Portuguese orders that were enrolled as regiments against the Arab invaders of the Peninsula, though titularly still existing, yet really ceased to be more than a name when the Moslem power in Spain was finally broken. But the active organization of war is a more fruitful germ, and has never since ceased to put forth new developments, varying with the notions of each period. To this epoch belongs also the beginning of that policy of the Roman see of utilizing the monastic orders, won over by special privileges and exemptions, as a body of supporters almost a militia more to be relied on than the secular clergy, and thereby the seed of discord between secular and regular, destined to work much mischief later was sown, and also the beginning made of that centralization of monachism which tended from the first to its unpopularity and decay.

It was found that a new order was the best safeguard for enthusiasm which might become dangerous if encouraged, but which could be made a valuable auxiliary if allowed to take shape in a form acceptable to society, hoping to attract precisely such and it is worth remarking that it was even so when the wise policy was departed from that Peter Waldo vainly sought in 1179 recognition and sanction from Pope Alexander III for his proposed institution of lay preachers, gave rise to a sect of the Waldenses, which still existing and which has been a great trouble to the Roman Church quite disproportionate to its numbers and importance. The Carmelites, founded by Berthold of Calabria on Mount Carmel about 1150, and incorporated under the rule by Albert, Latin patriarch of Jerusalem in 1209, were the first order of importance which sprang up at this time. The Celestines, another order founded at Sulmona in Lombardy in 1215, are most chiefly for their [illegible] for men and women, the Begynne, [illegible] houses specially suitable for their [illegible] of education whence many later active [illegible] and of the Humiliati, [illegible] 1196, [illegible] for the reconciliation of captives among the [illegible] and Saracens, founded by John de Matha and [illegible] Valois in 1198, never rose to great importance [illegible] the Servites, an order of the [illegible] 1233, powerful in Italy. The period of rapid multiplication was quickly followed by one of equally rapid decay, the first to show clear tokens of decadence being the rigid Cistercians, who never recovered their old meaning, and who, it may be mentioned, were accounted much of that hatred of the Church of the Fathers in

by the natives, which, given fresh fuel by the Reformation, has lasted to the present day.[1]

Yet another fresh departure in the history of monachism, in some respects the most momentous of all, was taken in the 13th century by the institution of the Mendicant Orders, or Friars. Pope Innocent III., in the 13th of the 70 constitutions or canons he promulgated at the Lateran council in 1215, had expressly forbidden the foundation of any new orders, bidding all who desired to embrace the more strict life join some approved community, and similarly directing that such as desired to found new houses should take their rule and constitution from one of the sanctioned types. But circumstances were too strong for him, and this very pope was destined to sanction two of the most remarkable orders which the Latin Church has ever produced. The time was an anxious one. The speculative activity of the age, coupled with the unrest in the church, was multiplying sects, to which its remedies, and still more from the contrast they afforded to its presented, not only to that of the secular society of the day, but to that of the ecclesiastics, notably those of rank, whose pomp and luxury gave rise to the brilliant stimulus of a revolutionary spirit among the common, which the great pope, who was then the most conspicuous figure in Europe, did not fail to observe. No effectual weapon of resistance seemed at hand, the parochial clergy, yielding to the difficulties which an isolated ritual life threw in the way of intellectual effort (far greater then than even now), had almost everywhere sunk into both and incapacity; the monastic orders were content, in the better instances, with maintaining their own internal discipline, and had no surplus energy for external work, while in the worse examples (as in that of the Cistercians, just referred to) they served rather as beacons of warning than as patterns for imitation; and, in short, there was an ever increasing mass of home mission work to be done, and no one to do it.

But the two men who were to do it were already at hand in the persons of Francis Bernardone of Assisi and Dominic Guzman of Osma. The ruling idea in the mind of the former was the elevation of poverty to the first place among Christian graces, as the most obvious way of conforming the life of a Christian to that of the founder of his faith; the more intellectual Spaniard dreamed of an aggressive body of highly trained preachers, able to grapple with the subtle attacks of the heretics, to expose the unsound creed, and to appeal in clear and powerful language to the unconverted, amongst whom the Albigenses and other sectaries were making considerable progress. Francis, the poet and devotee, in consequence of a [illegible] prevision which the [illegible] orders [illegible] for their [illegible], and bidding his followers to [illegible] as fully forgotten [illegible]

[illegible] by a lady of Provence to [illegible] abbey [illegible] to be the founder [illegible] house [illegible] which were [illegible] Before the [illegible] the [illegible] even the [illegible] provide [illegible] another with the [illegible] little [illegible] the cook, who [illegible] that the [illegible] the monks to [illegible] for them to be as [illegible] might, that some of their [illegible] plunging her into [illegible] that the [illegible] at length living; a [illegible] Ireland, till recalled by the bishop, who was forced to send him away [illegible], after appointing a deputy, that this deputy, when drunk had wounded two of the monks, who thereupon murdered him, so that the house was practically past reformation, and ought to be dissolved.

no thought for the morrow, appealed to the p imagination, always ready to kindle at the sight of g self-sacrifice; Dominic, with not less insight as a t whose first care was for doctrinal orthodoxy, as t Francis was for personal piety, saw that there demand ready to spring up for more exact and int religious teaching than could then be had, save in great cities. The occasion which urged him to th he undertook is noteworthy. He had long been a of Osma, the strictest and sternest member of an community, when in 1203 he had to go on a journe his bishop, which brought them into the very midst Albigenses in the county of Toulouse, where they s powerless the clergy were to contend against thei On their road home the bishop and Dominic m three papal legates returning discomfited from Lang but attended with as much pomp as a triumphal p would have justified. Dominic rebuked them stern me them that it was not by splendid retinues and garb that the heretics won their converts, but by preaching, by humility, by austerity, and by a seeming holiness. Both the new founders soug obtained at Rome, after some difficulty, the appr their new institutes, and that in the very year 121 had seen the formal prohibition of all fresh Francis speedily returned to his home, but Dominic idea had by this time expanded from that of con merely the Albigenses of Provence and Languedoc of influencing the whole world of nominal Christia outer heathen, settled himself in Rome, where th appointed him to the important office of Master Sacred Palace, which has ever since been held Dominican, and carries with it the authority o censorship of the press. The two new foun borrowed from each other, Francis copying Do scheme of itinerant preachers, and Dominic impos his disciples the mendicant poverty of Assisi. The particulars, the total absence—at any rate at first—of endowments as had proved a snare to the older so and the substitution of itineracy for inclosure, features which distinguish the friars from the mon preceded them. The Franciscan institute was attempt to democratize the church; Dominic's Preachers, though recruited freely from men of a grade have always had somewhat more of an aris to be about them, due to their intellectual calling have held a high place in Christian art, counting a their proudest names as Fra Angelico and Baccio della and their reputation for orthodoxy and for a pur of mixed theology than the Jesuit one has alway have. They also count amongst their members t most eminent divine of the Middle Ages, A Magnus and Thomas Aquinas, and they have been as producing zealous missionaries; but the one gr of their claims is that they have been the direct official of the Inquisition ever since the formal e tion of that tribunal as a permanent organization Franciscans, less distinguished for mental triumph their competitors have yet some famous names, which are Duns Scotus and Roger Bacon—for B mar though set by the Franciscans as the "S Doctor" in competition with Aquinas, the " Doctor" of the Dominicans, is scarcely entitled hich intellectual rank—and at one time they seeme to establish as firm a hold on the university of Ox the Dominicans did on that of Paris. The swiftest and popularity attended the two new orders; pr and exemptions were showered on them from wealth, in despite of their vow of mendican emulously thrust upon them by the laity; and, al

a remarkable and widespread religious revival, a dead-lift to ministerial efficiency in every direction, repaid their early labours, while they had between them almost a monopoly of the popedom for nearly two hundred years. And one peculiarity of their organization gave them a degree of strength which no other orders possessed. Each monastery of the older societies was practically isolated and independent of all others, unless it were itself a dependent priory or cell belonging to a greater house. Some societies had, it is true, general chapters, but these were rare, and at best only effectual in establishing a certain uniformity of practice in all houses of the same rule. But the Friars, like the Templars and Hospitallers of an earlier day, and like the Jesuits of a later one, were enrolled in something of military fashion, under a superior general, with wide powers, who directed and controlled their actions from one central point. Every group of neighbouring friaries was formed into a *congregation* under a local head or provincial, and he was always in direct communication with the general, so that a common government united the whole body into a compact mass. But their very success was fatal to their character. The vow of poverty was the first part of their institute to break down. Even before they began to be counted amongst the richest orders of Christendom, there is indisputable evidence that of Bonaventura, fourth general of the Franciscans, that the mendicant system was working nothing but mischief. He tells us, writing while the order was still very young, and within fifty years of the founder's death, that it was even more entangled in money cares and business concerns than the endowed communities, precisely because there were no funds available to fall back on in emergencies, that the brethren, discouraged from work by mendicancy, were habitually idle; that they roamed about in disorderly fashion under pretext of questing; that they were such brazen and shameless beggars as to make a Franciscan as much dreaded by travellers as a highwayman, that they made undesirable acquaintances, thus giving rise to evil reports and scandal; that conventual offices had to be entrusted to untried, unspiritual, and incompetent brethren; that vast sums were lavished on costly buildings, and that the friars were greedy in the pursuit of burial fees and of legacies, so that they encroached upon the rights of the parochial clergy. If such were the mischiefs at work before the first zeal had begun to cool, it may readily be gathered how entire was the failure at a later time. Indeed as regards the Franciscans, not only did they endeavour to evade the stringency of their statute even in their founder's lifetime, but the whole society was soon divided into two hostile camps, one of which desired to adhere closely to the original rule, while the other was content to fall in with the habits of the "possessioners," as they had been wont contemptuously to name the endowed orders. And what is very curious in this connexion is that the friars who were loyal to the principle of poverty broke away for the most part from the church, forming new sects, such as the Fraticelli, or attaching themselves to elder ones, like the Beghards and the Apostolici, which handed on in secret the Gnostic traditions of the third century, apparently stamped out in the crusade against the Albigenses, while those who openly disregarded the will of their founder remained steadfastly in the Latin church. No order, except the Benedictines, has had so many branches and reforms as the Franciscans; amongst which it will suffice to name the Capuchins, the Minims, the Observants, and the Recollects; while the Poor Clares, the nuns of the institute, have also divided into Clarissines and Urbanists. The institution of Tertiaries, seculars affiliated to the order as honorary members, while continuing to live in the world, and adopting a certain modified daily rule, was a powerful factor in the success and strength of the order, and was adopted, but with less conspicuous results, by the Dominicans. The rivalry of these two great bodies with each other, prolonged with much bitterness for centuries, and their disputes with the parochial clergy, whom they long displaced in general repute and influence, belong rather to general church history than to the annals of monachism, and may be passed by with this brief allusion, while it suffices to say that all the support they, and the other less important communities of the same kind, such as the Carmelite and Austin Friars, received from the popes, who were effective allies, they were in every country where their houses were found was not able to avert their decline in general estimation, and there is no figure in later mediæval literature on which the vial of contempt and indignation are so freely poured as on the begging friar, and that, it must be said, deservedly.

By the 13th century the apogee of later monachism and the decline became instantly at the very outset of the 14th (which is also the date of ordination becoming the normal entry for church work, instead of the exception as formerly), continuing down to the crash of the Reformation. The great schism of the West, the rise of the Wickliffites and Lollards in England, and of the body later known as Hussites in Bohemia, could not fail to act injuriously on the monastic orders; and, though the creation of fresh ones continued none of those founded during this era were influential, and few durable. It will suffice to name some of the more prominent:—the Olivetans in 1313 who were rigid Benedictines; the nuns of Bridget of Sweden in 1363, who followed a rule compiled from those of Basil and Augustine; the Hieronymite monks in 1374; the Brethren of the Common Life founded by Gerard Groot in 1376, who did much for education and in home mission work, but are chiefly famous now in virtue of one member of their society, Thomas à Kempis; the Hieronymite Hermits in 1373–1377; the Minims in 1435, the Barnabites, a preaching and educational order, in 1530, the Theatins (a body of Clerks Regular who aimed at little more than restoring the tone of clerical life, made but little progress to authority, and are indeed mainly noticeable as having suggested to Ignatius Loyola several points which he adopted in regulating the mode of life to be practised by the members of his society in 1534), and the Capuchins in 1525.

In the Reformation period [illegible] the more reformed bodies had [illegible] in the foundation of even the rules of the [illegible] the constitutions of the Society of Jesus, Pope Gregory [illegible] Paul IV. [illegible] follow [illegible]

[illegible] Dr. Döllinger's *Fables respecting the Popes of the Middle Ages*, pages [illegible] and piety, but also on the condition of [illegible] the veil and openly contemplated [illegible] *Revelations* of Bridget of Sweden (1302–73) [illegible] cils of Constance and Basel, and by Popes Urban VI., Martin V., and Paul V., fully confirm the darkest features of this testimony as regards the religious houses of the 14th century.

man Church during the actual crisis of the Refor-

Apart from such direct revolts from the Latin
ch as those in Bern, Zurich, Denmark, and Sweden,
t once involved the monasteries in the general
w of the old system of things, religious, the most
ble proceedings in the reaction against monachism
e taken in England, at a time when no breach
Roman Curia was thought of. So far back as
h century kings John and Edward I., and yet
1337 Edward III. had confiscated the "alien
" as those houses were called which were dependent
foreign monasteries, and the last named let out
ds and tenements until the peace with France in
hen he restored their estates, and similar land were
them both in his reign and in that of Richard II.
V. showed them more favour, but in 1410 the
Commons proposed the confiscation of all the
lities held by bishops, abbots and priors, petitioning
crown to employ the revenues thus saving a
army of knights and men-at-arms, meanwhile the
of some of the noble families, to endowing a
hospitals, and in making small yearly payments to
lish clergy. This fact alone the unpopularity
hurch and the religious orders at the time, and,
the large scheme was dropped. Yet in 1416
closed all the alien priories, and vested their
on the crown. They were for the most part
to cells to rival houses, but some portion, at
passed into private hands, apparently
. Hence there was nothing to excite surprise
opposition when Cardinal Wolsey in 1524
d bulls from the pope authorizing the suppression
small monasteries and the application of the
to other religious foundations on the plea that
revenues were quite inadequate, and not home of
education or learning, whereas a learned clergy was
ively needed to combat the new religious opinions
ere making headway. And that the monasteries
subject to errors, vices, and scandals appears
e fact that only about one half of all the foundations
known to have been made in England were in
the dissolution. There is little
o lend the charges of immorality brought against
ls when Henry VIII. had once resolved on the
of the monasteries, seeing how the path opened
by Wolsey could be followed up. The characters of the
king himself, of Cromwell, his chief agent in the dissolution, and of Layton, Legh, and others of the visitors
appointed to inquire into the condition of the houses, are
such as to deprive their statements of all credit; and
besides, the earlier Act of dissolution, granting the smaller
monasteries to the king, limits the charges of misconduct
to them, expressly acquitting the larger houses. Never-
theless, when the appetite for plunder had increased with
the first taste of booty, accusations of precisely the same
sort were brought up against the great monasteries,
though in no instance has any verifiable proof been pre-
served.[1] But there can be no reasonable doubt (especially
in view of the visitations of Archbishop Warham and other
pre-Reformation prelates), that the religious houses, viewed
simply as corporate estates, had been very badly managed
for a considerable time, were heavily encumbered, and a
weight round the neck of financial progress in England;
and that, as spiritual agencies, they had mainly outlived
their usefulness, so that, lamentable as were the circum-
stances of their destruction, and scandalous as was the
waste of the property seized, there is little reason to sup-
pose that any practical benefit would have flowed from
their continuance, whatever might have been the advantage
of an honest and economical measure of reform, or even of
transfer to other purposes on the principle of *cy près*.[2]

The negative evidence of the effeteness of the older
orders supplied by their very small share in the counter-
Reformation, which lay virtually in the hands of the
Jesuits alone, is reinforced by the reports made by the
emissaries of the new company to their superiors, which
attest that the accusations of the German reformers against
both the secular and regular clergy on the score of ignor-
ance and dissoluteness were only too well founded.
Accordingly several new societies were instituted during
the latter half of the 16th century, aiming at putting new
wine into the old bottles of the Carmelites, Cistercians,
Augustinians, Dominicans, and Benedictines; but none of
them proved of much importance. A larger measure of
success attended some established on an active basis, such
as the Fathers of Christian Doctrine, a catechizing order
erected by Pius V. in 1571; two communities for tending
the sick, one founded in Italy by Camillo de' Lelli in
1584, the other, the Brothers of Charity, by John of
God at Granada in 1538, but not formally sanctioned till
1572, and still more prosperity attended the Ursuline
Nuns, a community chiefly devoted to the education of
young girls, founded at Brescia by Angela de' Merici in
1537, and confirmed by Paul III. in 1544. Yet, with the
single exception of the Jesuits, no new society could be said
to have laid hold in any degree of the popular mind, nor
were the attempts to revivify the elder bodies continued.
It remained for two newer still to rehabilitate the waning
respect for monachism of all kinds, and that by borrowing
one chief feature of the Jesuit organization, the abandon-
ment of that principle of isolation from the outer world
which lies at the root of true monachism.[3] Of these the

[1] A full examination of the case against the monasteries will be found in Dixon, *History of the Church of England*, vol. i. pp. 324 *et seq.*

[2] The number of houses suppressed and overthrown by the two Acts of 1536 and 1538 was as follows:—186 Benedictine houses, 173 Augustinian, 191 Cistercians, 34 Dominican, Franciscan, Carmelite, and Austin friaries, 32 Premonstratensians, 28 Knights Hospitallers, Gilbertines, 20 Clunacs, 9 Carthusians, 3 Fontevraud, 3 Monteroes, 2 Bonhommes, 1 Brigittine; total, 616. Their aggregate revenues were valued at £142,914, 12s. 9d. annually.

[3] After the Jesuits rose into note and popularity, a very curious and little known extension of their institute was made in Flanders. Two English ladies, acting with the sympathy and counsel if not at the recommendation of F. Gerard, rector of the Jesuit college at Liege, founded a community which they named Jesuitesses, adopting

was the Oratory, founded by Philip Neri in 1558, but approved by authority till 1577, and copied inde ently by Cardinal de Berulle at Paris in 1611. There no vows imposed on the members of this society, gh they lived under rule, and they employed them- s in doing all kinds of clerical work under episcopal vision. The Italian house is chiefly celebrated as g included the famous Cardinal Baronius amongst rliest recruits; but the French one held a high pla o religious revival of the 17th century, well nigh ing the Benedictines of St Maur in learning (with representatives as Simon, Thomassin, Morin, and bran,he), and the reformed Cistercians of Port Royal ety, though sharing with the latter the reproach of anism. But the second was far more influential, and een fruitful ever since in the work of r copy t as in its own. It was the institute of the Si ter- narity, established by Vincent de Paul in 1634, on ines of the ancient community of the Ho-pitalle of St Augustine, but with some remarkable modi ons, not only in respect of the vows, which were only y and inward, but in the spirit of their discipline a ilated in his own memorable words, "Your convent be the houses of the sick, your cell the chamber of ring; your chapel the parish church, your c, treets of the city, or the wards of the hospital your the general vow of obedience, your cross the boa od; your veil to shut out the world, holy modesty. original scheme of Francis de Sales for the Nuns of Visitation, founded in 1610, was almost identical he opposition was then far too strong, and he w d to make them a cloistered community. Vincent of Mission Priests, more commonly known as La o was also a successful and useful institute, though vying in the extent of its influence with the other, , as has been implied, has powerfully affected the ization of many of the active communities which since been formed. No religious body did more to e French monachism to bear up against the general gny it encountered during the 16th, 17th, and early centuries, a temper on the part of the public due ore than one cause. In the first place, the wars of on had done much to harden and coarsen the feelings oth sides, and rigid adherence to the extreme positions atholics or Huguenots, as the case might be, was ot bove any gentler and higher ideas. Next, the mona s of both sexes had all but universally fallen into the onage of the crown (in virtue of the concordat of gna, between Pope Leo X. and Francis I.), and were d away as apanages for a dissolute nobility, who ndered the revenues, and suffered discipline to become ed, often to the generation of serious scandals. Thi ersation operated in two ways. It made the monks s hard and bad landlords, grasping closely all the l privileges and monopolies which they continued to , a proceeding which bore hard on the tenants and urers, so that the monks shared to the full the unpopu y of the nobles (precisely as was the case in Germany, ng the Peasants' War of 1525); and the evil repute of the convents of whose real character we get at least one trustworthy glimpse in the account of the abbey of Mau- buisson which Angélique Arnauld reformed came home to all the Huguenots and their friends, because both before and after the legal continuance of the edict of Nantes they were used (according to a very early application of monastic houses not yet obsolete) as prisons, where Huguenot women and girls were shut up in order to bring about their conver ion, forcibly if necessary, but somehow in any case. And there is evidence to show that the Huguenots resented this policy most bitterly, not only on political grounds, but be cause they were firmly persuaded that the moral of their wives, daughters, and sisters were in no less peril than their faith in such place. When to this resentment is added the hostility of the Jansenist to the school of opinion which had persecuted them, razed their famous house of Port Royal, and literally flung the bones of its deceased members to the dogs, it will be easy to judge how powerful were the forces making for the overthrow of monachism, and how little even such stern reforms as De Rancé's at La Trappe, which has always had a marked attraction for ole and organization of the famous company, and taking the three vows, but, with a bold disregard of precedent, not only omitting ustomary vow of inclosure, but actually sending the members of ociety out as itinerant preachers. Their object was to train a of emissaries for the Roman Catholic mission in England, who obtain entrance and escape the incidence of the penal laws in a er impracticable for men. They had considerable success for a and Mrs Ward, their projector, obtained some degree of papal oval, and became "mother-general" over more than 200 of these preachers in the various colleges of the society. But after an nce of about eighty years it was suppressed by Pope Urban VIII 30.

[illegible] Some of the often disputed the name of [illegible] interpretation [illegible] a point which has be [illegible] ce of those words to discussion, known [illegible] ers," [illegible] dict to the readers of *Marmion*. of the monasteries in other parts of Italy; but Tusc
likely, from local causes, to have been above, rathe
below, the average moral level. Against this g
tendency to monastic decay may be set the foundat
the Passionists in 1725, and of the Redemptori
Liguorians in 1732; but these two institutes, though
and respectable, have never exerted much influence.

There is little to chronicle in regard to the later
of monachism in Spain and Portugal. Peter of Alca
as reformer of the Franciscans of the latter coun
the middle of the 16th century, and his more f
contemporary, Teresa, as reformer of the Carmeli
Spain, are eminent figures in the annals of their tim
they cannot be said to have produced any perm
effect on the fortunes and tone of their several mot
far less upon the common life in general. The sta
out of all varieties of opinion, at any rate in resp
outward expression, by the Inquisition in the Pen
makes the evidence scanty and vague; but the fac
Portugal took the lead in 1759 in striking at the J
then the most eminent and powerful of the orders, t
far surpassed in mere wealth and numbers throu
Western Europe by the Franciscans, and that its pol
this respect was quickly followed by Spain, attest
. . . owth of a hostile feeling by no means likely to
been limited to the great company. In fact, if pr
rhymes and proverbs may be trusted, the charges a
against the religious orders in Spain do not seem to
differed from those alleged elsewhere, whatever may
been the amount of truth in them. And the testimo
Blanco White, always to be trusted on matters with
experience, is decidedly adverse.

The terrible crash of the French Revolution,
affected, directly or indirectly, every country in E
was not least influential in its incidence on monas
On the one hand, the actual destruction which it br
upon the religious houses of France was adopted as p
the revolutionary programme in all countries where
institutions were still intact; and, on the other, there
considerable measure of improvement brought abo
not a few places by the fear of public opinion, whi
new institutes which continued to spring up were a
invariably active, both founders and the sanct
authorities recognizing that any society seeking to
a footing good must needs first prove its capaci
practical usefulness. In France itself the laws
abolished all religious communities were relaxed b
advance in favour of the Sisters of Charity even
the Terror and the Directory; while in 1801 a dec
the Consular Government, issued by the Minister
Interior, authorized Citizeness Dulcan, former super
that society, to revive it by taking young women to
or hospital work: and various other active commu
were restored by Napoleon in 1807. Further re
took place at the Restoration, the most celebrat
which was the Dominican, owing to the talents an
eloquence of Lacordaire and the group he gathered
him. But Benedictines, Carthusians, Trappists, and
orders of the older type were not slow to avail
selves of the opportunity to return and to found
amidst a poverty which recalls the original instit
their abbey and priories. But they met with little
under the Orleanist monarchy, and the Second Empi
their time of most security and progress. Since it
they have again been actively discouraged by a s
party in the Republic, and their position remain
carious. France has been, further, the chief seat o
many new societies founded for some especial depar
of charitable work, the most characteristic examp
which is perhaps that of the Little Sisters of the

ouse and tend aged invalids. As a broad general
nearly every post Reformation institute is styled, not
Order," but a "Congregation", but the only d
n which can be drawn between the e two names
t. "order" is the wider, and may include several
gations within itself (as the Benedictine order,
ample, includes the congregations of Cluny and
Maur), while a "congregation" is a simple unit,
te in itself, and neither dependent on another
te nor possessed of dependent varieties of it own.
r distinction drawn between the elder and younger
s is that the former are said to make "solemn
the latter only "simple vows." The difference
not in the matter of the vows, which are usually
ne in all cases, nor even in the ceremony attending
utterance, which may also be alike, but in the
r binding efficacy of the solemn vow in Roman
law, which rules that they so bind the member to
iety, and the society to each member, that neither
r the connexion, so that only the pope can dis-
that in rare and exceptional cases (here
added that the term "religious" is restricted in
n Church to communities whose institute has been
y approved by the Roman see, and whose vows
life, and not merely renewable (a principle which
s the Sisters of Charity, for example, from the use
title. By the laws of France (and of some other
es, life vows are invalid and even prohibited, but
hey make part of the original institute, such ac-
al by the civil power is not held to reduce them to
nomical level of temporary vows.

rning to the history of Western monachism the
the religious houses in Spain date from the law of
ne 1835, which suppressed nine hundred monasteries
ow, and the remainder had but a short respite be-
ere dissolved on 11th October of the same year. In
al, where a bias against the Roman Church has been a
onal part of patriotism ever since the revolution of
when the pope sided with Spain against the hot
aganza, there was little decline to protect the
eries when it happened that the crown wanted
ossessions, and they were all suppressed by the
of 28th May 1834. No European country had so
religious houses as Portugal in proportion to its
tion and area, and the number of the foundations
d in 1834 exceeded 500. In Switzerland a com-
le measure of suppression followed the war of the
bund in 1847; while in Italy, the last country
monachism had remained almost unmolested, an Act
ssed in the Sardinian Parliament on 7th July 1866
suppression of monasteries within the Piedmontese
ons, and for the confiscation of their property.
easure was extended to the whole of Italy after the
tion of the kingdom, the orders were expropriated
; their houses were declared national property and
ort to secular uses, no exception being made in
favour of San Marco at Florence, of Assisi, of Va
brosa, or even of Monte Cassino itself.[1]

On the other hand, several Roman Catholic soc
have attained considerable success in the United S
and Canada, thus in some degree recovering fo
principle they represent part at least of the ground l
Europe, while in three religious communions out o
pale of the Latin obedi Evangelicals of Ger
the Reformed of France and the Church of England
organization of women for charitable and religious
on the lines of various old institutes has been ac
carried out. The Deaconesses of Kaiserswerth, fou
by Pastor Fliedner in 1836 derive part of their rule
even of their dress, from the Duke de St Aign
themselves lineal descendants of the ancient Ho pitall
the crusades, and have received into several comm
the Stra burg and Mulhausen Deaconesses derive
partly from the French Revolution and partly from
point in the Moravian or unitarian itself branded
from these centres Europeans to whom the A
Protestantism really owes its origin, while the various An
communities of which there are several have been
freely from different sources, according to the pecu
and knowledge of each founder. Some attempt
reviving the common life for men also have been
made, but none on any large scale, only one has
exhibited any signs of vitality, a preaching orde
Cowley near Oxford, which has obtained some footi
England, and has even been able to spread to Americ

[1] The Benedictine congregation of Monte Cassino is the most important and best known of modern times. Founded by Ludovico Barbo, abbot of Santa Giustina at Padua, in 1408, it was reformed by Giustiniani, bishop of Belluno, in 1504, and by Cardinal Gerolamo Seripando in 1530. It was suppressed by the French in 1798, but restored in 1837 by Pope Gregory XVI. It has its own constitutions, and is governed by a president-general, elected every six years by the abbots of the congregation. Its members are known as Cassinese. See Mabillon, *Annales Ordinis S. Benedicti*, vols. v. and vi. (Paris, 1739); Tosti, *Storia della Badia di Monte Cassino* (Rome, 1842–1843); Gattola, *Historia Abbatiae Cassinensis* (Venice, 1733); and Bertaux, *Dominique de la Rochette* (Paris, 1904).

Chronological Table of Monastic Rules

igious communities which have been formed at various times in the Western Church, amounting to several hundreds, and not nearly all of which are even now extinct, it is impossible to give more than a selection. Nor could a list of those even approximately complete be given, since many of them have been suppressed and revived more than once, and in different countries at different times, while some among them have been approved by authority and recognized by authority as published, it is their object to observe, and have separately and independently local varieties or branches of identical rules, and in that case the date of the earliest foundation where a number are enumerated, and practically disappeared from view, though, as still lingering in one or two houses, not absolutely extinct. The following table gives the more remarkable foundations in chronological order, some of the earliest of which are only approximate, and even uncertain, for the historians often vary as to the exact year, sometimes even that of the founder, and usually that of the final approval by authority.

Name	Founder	Place	Date	Notes	Order	Diocese
Monks of the Thebaid	Paul the Hermit	Upper Egypt		Ascetic Canons (continued)	Ascetic	Orthodox E
Tabennites	Pachomius	Tabenna in the Nile	400	Severest Sleepless	Ascetic	Africa, Mesopotam

ONACO (French *Monaco*), the smallest of the seven principalities of Europe, with an area of 8·31 square , a population (1878) of 7019, and an army of 72 is situated on the coast of the Mediterranean, 9 miles of Nice, and bounded on all sides by the French rtment of the Maritime Alps. Previous to 1861, the communes of Mentone (Menton) and Roccabruna uebrun) were sold to France for 4,000,000 francs, the was about a third larger; but the population, which those portions again included would now be 15,000, only about 8000. Monaco has long had the reputa of being one of the most beautiful and sheltered on all the Franco-Italian coast: *non Corus in illum habet aut Zephyrus, solus sua littora turbat Caurus*, Lucan: and a luxuriant growth of aloes and prickly s (introduced in 1537), palm trees, eucalyptus, lemon , and geraniums gives a warmer colour to the scene Lucan can have known. The town occupies the level mit of a rocky headland, rising about 190 feet from shore, and still surrounded with ramparts. Though ly modernized, the palace is a fine specimen of Re ance architecture; the new "cathedral" (French Re ance style), the new church of St Charles, and the mm may also be mentioned. Behind the rock, between Tête de Chien and Mont de la Justice, the high nds rise towards Turbie, the village on the hill which s its name from the *tropaea* with which Augustus ed the boundary between Gaul and Italy. On the rn side lies the little port or bay of Monaco; along ower ground at the head of the bay stretches the vil of Condamine with orange gardens, manufactures of nes and liqueurs, and the chapel of Ste Devote, the n saint of Monaco; farther to the east, on the rocky slope of the Spelugue (espelugue = cave) are grouped the buildings of the Casino, Monte Carlo and the ma and hotels which the influence- to

they were traversed by the new road to Mentone, Cor caused them to be covered with soil by Italian e and since 1858, when the first stone of the Cas land, the process of artificial embellishment has been

the most magnificent scale. The gaming establish- now in the hands of a joint stock company with a of 1,000,000 francs. None of the inhabitants of have access to the tables, and their interest in the ance of the *status quo* is secured by their complete from taxation, and the large prices paid for Gambling tables were set up at Monaco in but it was not till 1860 when M. Blanc, expelled Lombardy, took possession of the place, that Monte gan to be known.

ng and culture. Spade husbandry generally prevails. Th common manure is a compost of lime and burned turf Marl is abundant, but is little used, and gypsum also is foun

The number of holdings in 1881 was 17,849 of which as n 10,781 did not exceed 15 acres in extent, and 4870 of these exceed 5 acres; 6451 ranged between 15 and 50 acres, and were above 200 acres. The area of arable land was 278,755 a 87 per cent of the whole, while 5258 were under plantation bog and marsh, 5230 barren mountain land, and 21,582 water and fences. The following table shows the areas under the ent crops in 1870 and 1880.

Horses numbered 10,329 in 1872, and 10,666 in 1882. Some were mules numbered 300 and 169, and asses 1314 in The number of cattle in 1872 was 81,333, and in 1882 only an average of 2·9 to every 100 acres under cultivation average for Ireland being 25·8. Sheep between 1872 and declined from 42,964 to 9,856, a very inconsiderable number increased from 26,000 to 29,972, goats from 887 to 1239 poultry from 94,544 to 131,260.

According to the latest return the land was divided among proprietors who possessed 311,440 acres, with a total annual v 2,961,222. The average of the properties was 211 ac the average value per statute acre 17 shillings. The lar even proprietors possessed upwards of 10,000 acres, E. P. S 20,556, marquis of Bath 17,762, earl of Portrey, 17,345, Rossmore 14,839, Sir John Leslie 13,621, Viscount Templ 12,515, A. V. Hope 11,700.

Manufactures.—The only manufacture of consequence is which of late years has been on the increase. The num cotton mills in 1881 were 10, of which 6 were worke water, 3 were worked by water and steam.

Ethnography.—The county includes 5 baronies, 23 pa and 15 town-lands. Assizes are held at Monaghan, and q sions at Carrickmacross, Castleblayney, Clones, and Mon There are 5 petty sessional districts within the county, and another. It includes the poor-law unions of Carrickmacr Monaghan and portions of Castleblayney, Clogher, Clones, Lisnaskea, Dundalk. It is in the Belfast military distric circuit of Armagh. There is a barrack station at Monaghan the Irish parliament two members were returned for the and two for the town of Monaghan, but at the Union Mo were disfranchised.

Population.—The population in 1841 was 200,142, but i to have diminished to 111,873, in 1871 to 111,969, and in 1 to 62,071 females, of whom 50,077 were male and 62,071 female In 1861 75 per cent. of the inhabitants were Roman Ca 16 per cent. Episcopalians, and 11 per cent. Presbyterians number of emigrants from 1 May 1851 to 31st December 18 to 10, or about 1840 persons per annum; while during the year ending 31st March 1881 the annual rate of emigrat per 1000 of the population. The death rate to every th of the population for the ten years ending 1881 was 16·9, th to 2·4, and the marriage rate 8·6. The towns possess su to 1000 inhabitants are Monaghan 3369, Clones 2216, C to 2007, Castleblayney 1810, and Ballybay 1651. Mon county town, received its name *Muineachan* (the town of monasteries founded there at a very early period. The to corporated by James I., but it was little more than a hamlet until the close of the 18th century. Besides the usual county bu courts, a Roman Catholic college, and National model s

History and Antiquities.—In the time of Ptolemy, Mo formed part of the territory of the Scoti. Subsequently it to the district of Oriel or Orgial, and long known as Maec country it became shire ground in the reign of Elizabeth.

The antiquarian remains of Monaghan are comparatively meagre. At Clones there is a round tower in good preser but very rude in its masonry, another at Inni-keen dilapidated. Near Clones there are two large raths. Al there are several old Danish forts there are no mediæval ca importance. The only monastic structure of which any re mains is the abbey of Clones which was also the seat of a bis The abbey dates from the 6th century, but was rebuilt in t century after destruction by fire. On the site of the Fra abbey at Monaghan a castle was erected, which was in a condition in the time of James I.

MONAGHAN, an inland county of Ireland in th of Ulster, bounded E. by Armagh, S.E. by S. by Meath, S.W. by Cavan, W. by Fermanagh by Tyrone. The area is 318,806 acres, or 498 The north-western part of the county includes great central plain of Ireland, but in the south-east an upraising of Lower Silurian rocks. The surface is r although none of the hills are of great elevation. an equal range is that of Slieve-beagh, 1255 feet above sea-level. Formerly much of the

ne of trees, in the early decades of the nineteenth century ...nery is to be viewed from monotony by the large num small lakes and streams. The lakes number in all 200. The principal rivers are the Finn, which leaves centre of the county and passes into Donegal; Blackwater which forms the boundary with Tyrone ...ter Canal passes the towns of Monaghan and ...ffording communication between Lough Neagh ...h Erne. Peat occurs at several places. There ...no of workable coal in the north-west of the The rock-salt is not only abundant and good, in the portion of the rocks it can be obtained at ...nall expense and in any quantities. Free-stone and slate are ...d in considerable quantities. The other mineral ...lead ore, antimony, fuller's earth, marble, and ..., but the quantities obtained are inconsiderable.

Climate and Agriculture.—Partly owing to the large proportion ...nd water the climate is somewhat moist. The soil in the ...al portions of the county is very fertile where it rests on ..., and there seldom is any lack of depth, which is esp...ially ...ficial cultivation; but in the hilly districts a stone retenti...ails, which could be made productive only by careful drain

MONARCHIANISM, in its technical Christo... sense, designates the view taken by those Christian

the church, towards the end of the 2d century uring the 3d, opposed the doctrine of a hypostatic (hypostasianism) or of an independent personal subre of the Divine Word. It is usual (and convenient) ak of two kinds of monarchianism,—the dynamistic e modalistic. By monarchians of the former class was held to be a mere man, miraculously conceived , but constituted the Son of God simply by the in high degree in which he had been filled with Divine n and power. This view was represented in Asia about the year 170 by the anti Montani tic Aloci, ed by Epiphanius on account of their rejection of the Gospel; it was also taught at Rome about the end 2d century by Theodotus of Byzantium, a currier, as excommunicated by Bishop Victor, and at a later y Artemon, excommunicated by Zephyrinus. About ar 260 it was again propounded within the church ius of Samosata (*q.v.*), who held that, by his unique ucy, the man Jesus gradually rose to the Divine , so as to be worthy of the name of God. Modalistic rchianism, conceiving that the whole fulness of the nd dwelt in Christ, took exception to the "subordinaism" of some church writers, and maintained that the Father and Son were only two different denominations same subject, the one God, who "with reference to ations in which He had previously stood to the world d the Father, but in reference to His appearance in ity is called the Son." It was first taught, in the ts of the "monarchia" of God, by Praxeas, a confrom Asia Minor, in Rome about 190, and was opposed tullian in his well known controversial tract. The new the "patripassian" as it was also called, became ned that God the Father had suffered on the cross. d fresh support in Rome about 215 from certain s of Noetus of Smyrna, who received a modified t from Bishop Callistus. It was on the account ppolytus, the champion of hypostasian subordinatian ong with his adherents, withdrew from the obedience stus, and formed a separate community. A new and atory phase of patripassianism was expounded at a hat later date by Beryllus of Bostra, who, while holding divinity of Christ not to be *ouse*, or proper to Himself *πατρικὴ* (belonging to the Father), yet recognized personality a new *πρόσωπον* or form of manifestation part of God. Beryllus, however, was convinced of ongness of this view by Origen (*q.v.*), and recanted synod which had been called together in 244 to it. For the subsequent history of modalistic monism, see Sabellius.

NASTICISM. See Monachism.

NASTIR, Bitolia, or Toli Monastir, a city of ria, now the chief town of the Turkish vilayet of ia, is situated at a height of 1880 feet above the a western inlet of the beautiful, fertile, and many l plain which, with a breadth of about 10 miles s for 10 miles eastward from Mount Perister feet high) to the Babuna chain. It is embosomed masses of foliage, and crossed by a rough channelled am stream, the Drahor, which joins the Czerna or , a tributary of the Vardar. The military advanf its position at the meeting place of roads from a, Durazzo, Uskiub, and Adrianople led the Turks 1820 to make Monastir the headquarters of the lian *corps d'armée*. Since then its general and eral importance has greatly increased. A considermount of gold and silver work (especially clasps and) is made by the local craftsmen. The population at 40,000.

stir, so called from the monastery of Bukova (The Beeches), ndred feet up the slope of Peristeri, is identified with the ancient Heraclea Lyncestis on the Egnatian Way; and its b is still called the bishopric of Pelagonia from the ancient the plain. In 1833 the town was the scene of the massacre Albanian beys.

MONBODDO, James Burnett, Lord (1714 author of work on the *Origin and Progress of La* (published in 1773), and *Ancient Metaphysics* (1779 one of the most marked characters in Scottish l cycles in the 18th century. He was born in 17 Monboddo in Kincardineshire, studied at Aberdee Groningen, and quickly took a leading position Edinburgh bar, being made one of the Lords of S in 1767. Many of his eccentricities, both of conduct opinion, appear less eccentric to the present gene than they did to his contemporaries, though he se have heightened the impression of them by his hum sallies in their defence. He may have had other r than the practice of the ancients for dining late an forming his post prandial walk in head of m a e His views about the origin of society and language a faculties by which man is distinguished from the afforded endless matter for jest to the wits of hi but readers of this generation are more likely to b puzzled by the frequent characteristic touches of ge acuteness of his conclusions than amused by his s city. These conclusions have many curious points of fact with Darwinism and Neo Kantism. He re kidnapping man as one of the animals, and of collecting about cases of tribes to throw light on the problem civilization having come into contact with the one intimate knowledge of Greek philosophy with the In both respects Monboddo was far in advance neighbours. His happy turn of [illegible] might be adopted as a motto by the Evolutionist Neo Kantian would meet head to head to be told that he put by circumstances of birth at 1773. His [illegible] ated from the writings from the Platonic and poetical t honourable among writers of his own class on subjects as he handled confirmed the view of his temperament that he was one, and to a great extent supremely ated and precocious. He died 26th May the advanced age of eighty six.

MONCTON, a town of the Dominion of Canada Westmorland, New Brunswick, 89 miles by rail east of St John; a port at the head of navigation Petitcodiac, and the point of the west loop and g offices of the Intercolonial Railway. The popul about 1900 in 1871, was 4032 in 1881, the grow the place has been favoured by the establishment of refining factories, a cotton factory for cotton and bra water since the Canadian Parliament in 1879 adop policy of protection. For the year 1881–82 the a amounted to £61,814 and the import to £252,571.

MONDOÑEDO, an episcopal city of Spain, 27 north northwest from Lugo, in the province of that , at about 1200 the Sixto, a small tributary of the N on the Atlantic side of the Cantabrian chain, reach to an elevation of 1800 feet by considerable hill population in 1878 was 10,112. The principal bu are the ruined Late Corinthian fragments of the cathedral, a convent of Franciscan friars of Ma which is now used for a theatre and a palace, ches the royal hospital. The manufactures, which are unimp include lace making, linen weaving, and leather fac ture.

According to local tradition the bishopric of Dumium Braga, was transferred to San Martin de Mondoñedo (three from Mondoñedo) in the 8th century, at which time it w ed by Dona Urraca in the beginning of the 12th centu about sixty years prior to 1233 the see was at Lugo. After

r nearly a century and a half in the hands of the Moors, nedo was recaptured by Ordoño I. in 858; and the Christian on was made permanent by Alphonso III. in 870. It was y surprise by the French in 1809.

NDOVI, a city of Italy, in the province of Cuneo, les east of Cuneo and about 55 west of Genoa by as formerly the chief town of the Sardinian province ndovi, and between 1560 and 1719 the seat of a onte s university. The central quarter occupies the t of a hill 1670 feet high, and contains the hexa pace s, a citadel erected in 1573 by Emanuel Phili he cathedral of St Donatus, a spacious episcopal and the statue of Beccaria, who was a native of n. At the foot of the hill along the banks of the Ellero (a tributary of the Po) lie the industr commercial suburbs of Breo, Borgatto, Pian della and Carassone, with their potteries, tanneries, works, &c. The mansion of Count San Quintino della Valle was the seat of the printing-press whic 1472 issued books with the imprint Mons Regalis; modern times the Ducal press founded by Emanue bert has acquired a great reputation. The popula the town was 9637 in 1871, with the suburbs that of the commune 17,726 in 1861, and 17,902 in

Breo is identified with a certain Colonia Brebolensis; b dovi proper — Mons Vici, Mons Regalis (Monteregale, or Vic probably did not take its rise till about 1000 A.D. The l dates from 138[illegible]

MONEY

Definition and Functions of Money. The precise on of Money is a question presenting no small ty, and it has been complicated by the attempts of riters to define the term so as to lend support to favourite theories. The real difficulties of the subject wever, chiefly connected with paper money, and as le of the question has been dealt with in the article (*q.v.*) it will here be sufficient to adopt the short ehd description of money given by a distinguished an economist as being "that which passes freely and to hand throughout the community in final dis of debt, and full payment for commodities, being d equally without reference to the character or credit per on who offers it and without the intention of the who receives it to consume it or enjoy it or apply it other use than in turn to tender it to other pu di of debt or payment for commodities."[1] In this the essential features of money are plainly set forth, as is frequently the case in economics, particular and to bring within the description may be found functions which money discharges in the several m are (at least in the opinion of all writers worth g here) clearly marked. The most important is facilitating exchange. It is not necessary to dwell great importance of this office. The more consider d industrial organization how that it is based on ision of employment. But the earliest economic saw clearly that division of employment was possible only by the use of a medium of exchange. law that the result of metering out [illegible] to bring about a state of things in which each al produced little or nothing directly adapted to his own want, and that each one was to live by ing his product for those of others. They saw, er, that this was not feasible without some object all would be willing to accept for their peculiar pro or otherwise the difficulty of getting those together who [illegible] would be a complete hindrance to exchange, which alone made division [illegible] possible. A second function hardly inferior in ance to the one just mentioned is that of affording measure or means of estimating the comparative value of dif commodities. Without one common commodity as and of comparison this would be almost impossible. rather than carry it and wanted to buy bread or a t would be very troublesome to ascertain how much e ought to obtain for a coat or how many coats he should give for a horse,"[2] and as the number o modities to be dealt with increased the problem wo come harder, "for each commodity would have to be in terms of every other commodity." Indeed it reasonably maintained that the idea of general valu not be formed without the existence of money, and s known of savage races tends to bear out this view. adoption of some one commodity renders the com of value easy. "The chosen commodity becomes a *denominator* or *common measure of value* in terms of we estimate the values of all other goods,"[3] and thus which its primary function renders exchanges pos acts as an intermediate term in each exchange, also exchanges easier by making them definite. Anothe tion of money comes into being with the progress of One of the most distinctive features of advancing tion is the increasing tendency of people to trus other. Thus there is a continual increase in relat contract, as may be seen by examining the develop any legal system. Now a contract implies someth be done in the future, and for estimating the value future act a standard is required; and here money already acts as a *medium of exchange* and as a *measure* at a given time, performs a third function, by affordi approximate means of estimating the present value future act, and in this respect may be regarded as a *st of value*, or, if the phrase be preferred, *of deferred pay* Some writers attribute a fourth function to money, much as they regard it as being a means of easily up value. Doubtless it does supply this need, wh especially pressing one in early civilizations owing to scarcity which then exists, but with the prog settled government the need becomes less extreme. forms of investment grow up, and the habit of h money become unusual. It is therefore better to the functions of money as being only three in numb to furnish (1) the common medium by which exc rendered possible, (2) the common measure by the comparative values of those exchanges are est and (3) the standard by which future obligatio determined.

2. *Causes which Determine the Value of Money. Q of Money needed by a Nation.* The problem of the minute causes of the value of money is a particular the general problem of values, but there are circum which render the inquiry more than usually comp Before considering these it will be well to deal wit of the phrase "value of money" which has led to mu

For our present subject, "the value of a thing is what
exchange for: the value of money is what money
xchange for, or its purchasing power. If prices are
money will buy much of other things, and is of high
; if prices are high, it will buy little of other things,
of low value. The value of money is inversely as
l prices, falling as they rise and rising as they fall.[1]
n the general theory of value it appears that the
mate condition which determines it is the equation
en supply and demand; and this is clearly the case
eference to money. These terms, supply and demand,
however, some elucidation. Let us consider what is
by the supply of, and demand for, money. The
of a commodity means the quantity of it which is
l for sale. But in what shape does the offer of money
place? By being offered for goods. "The supply of
, then, is the quantity of it which people are willing
out;" or, to put the point more concisely, it is "the
oney *in circulation* at the time." Again, to select
f demand, "the demand for a commodity is the power
g power offered for it." Demand in the general case
ney consists of all the goods offered for sale. There
wever, a peculiar feature in the case of money which
from its position as the medium of exchange, viz.
money is, so to say, in a "constant state of supply
emand," since its principal service is to
s of purchasing commodities.[2] From this follow
he factors which determine the value of money within
n time are: (1) the amount of money in circulation
2) the amount of goods to be sold. On closer examination
it will, however, appear that there are other elements
taken into account. In the first place, the quantity
oney is not by itself the sole element on the supply
In some instances a coin will not circulate more
two or three times in a year, while another coin may
hundreds of purchases. In determining the value of
y these varying rates of circulation have to be combined, and by taking an average we may establish the
nce of a fresh element to be estimated, namely, the
ge rapidity with which money does its work, or, to
Mill's expression, "the efficiency of money." On
le of demand, again, it is not the quantity of commodities
that is the determining element, but the amount of
and the same article may, and generally does pass
gh several hands before it reaches the consumer;
this it follows that (if the consideration of credit in
rious forms be omitted) the value of money is inversely
quantity multiplied by its efficiency, the amount of
nsactions being assumed to be constant. This formula
res, however, some further explanation before it can
cepted as a full expression of the truth on the subject.
st be noticed that it is not commodities only that are
nged for money. Services of all kinds constitute a
portion of the demand, while the payment of interest
e various forms of obligation requires a large amount of
circulating medium. The potent influence of credit
must be dwelt on. This latter force is the main element
considered in dealing with variations of prices, but

so far as it is based on a deposit of metallic money
be looked on as a means of increasing the effici
money, and therefore as coming within the formula
above. In its other aspects it lies outside the r
this article. Some interesting conclusions may be d
from the results we have arrived at. One of these
the "increased development of trade," or "expan
commerce, *of itself* tends to lower not to raise
for, by increasing the work which money has to d
the amount remains the same it lowers its value.[3] A
consequence is that a large addition may be made
money in a country without any effect being produ
prices. This is evident, since money only acts on
by being brought into circulation, therefore, if the
which is added to the national stock is not used
way, prices will remain unaffected.

We have now sufficiently considered the proximate
ditions which determine the value of money, the ne
y to inquire. What is the ultimate

n W. Petty was of opinion that the amount of coin
be in a country was one tenth the rent of land, one
the amount of circulating rent, and one fifty-second
the annual wages of labour. Locke's view was that
th of consumers' goods annually purchased, was
sufficient. Modern statistics, however much
command of more exact data, decline to
a quantitative answer, and content themselves
ating the conditions which the problem involves.
we must take account of the work which money has
rm, and the speed at which it circulates. The
the same piece of money changes hands twice as
people will want twice as much money. The second
mount of trade transacted, the amount of bar-
ney doubled, the amount of money must be also
, unless at the same time the improvement in credit
ibuted. The efficiency of money is a third element
affect the quantity needed, and this is also
nt on the habits of the people and the facilities of
action. Other elements which can be only briefly
d are the degree in which credit exists between
ons, the amount of travelling which takes place
ercial outbreak, organization which exists
ets for which capital is to be estimated, the extent
ce of hoarding, &c., for all money hoarded
s withdrawn from circulation, and therefore increases the
ney needed. The habit of using in the retail
of large amounts only exemplifies this element in
. Again, the existence of barter does away
money would be required to
the exchanges effected by barter. The custom
ng with credit has a similar effect. The above
not have been considered the questions [illegible]. When we
plate the [illegible] from an international point of
he amount needed [illegible] allowance is made for the
ransportable [illegible] namely that which will keep
ry's prices at a [illegible] with those of the countries
hich it has commercial relations.[1] For otherwise
istry would have [illegible] either of importation or
ortation, which would [illegible] a flow of money to
ntry whose prices were lower than the general level.

Thus, then, is the condition which determines compa
prices between different countries; and, prices be
determined, the quantity of money needed to keep up
prices depends on the conditions above indicated.

gold in circulation was, in 1872, about £105,000,00
the note circulation £13,000,000. In any Contin
country the amount would probably be proportionally
greater, owing to the fact that there is in England a g
development of credit.

3. *Early Forms of Currency.* Up to the present w
considered money as being fully established and pr
adapted to fulfil its various functions. We have n
trace the steps by which a suitable system of currenc
evolved from a state of barter. It is important for a
understanding of the question to grasp the fact th
changes took place originally between groups, an
between individuals. This explains the slow grow
exchanges. Each group produced most of the a
necessary for itself, and such acts of barter as took
were rather reciprocal presents than mercantile exch
Such is actually the case at present among modern sa
"It is instructive to see trade in its lowest form a
such tribes as the Australians. The tough green
valuable for making hatchets, is carried hundreds of
by natives, who receive from other tribes in retu
prized products of their districts, such as red ochre fo
their bodies with. They have even got so far as
peaceful trade-parties, unharmed through tribes at w
that train of youths might be met, each laden with a
and one on his head to be carried to his distant
and hoped into a good customer. When strangers

ribbons, and presents are given on both sides. No
there is a general sense that the gifts are to b
exchanged, and if either side is not satisfied there w
grumbling and quarrelling, but in the roughest k
barter we do not yet find that clear notion of a u
value which is the great step in trading." This
description of what is going on at present among
race enables us to realize the way in which money
into existence. When any commodity becomes an
of desire, not merely from its use to the persons desir
but from their wanting it as being readily exchan
for other things, then that article may be regarded a
monetary money. Thus the greenstone and ochre
their way to being promoted to the position of cu
and the idea of a "unit of value" is all that is nec
complete the invention. "This higher stage is found
the Indians of British Columbia, whose strings of h
shell worn as ornamental borders to their dresses
the most obvious currency to trade with, "a string of or
quality being reckoned as worth one beaver's skin."[2]
shells, therefore, are in reality money, inasmuch as
discharge its functions.

On a review of existing savage tribes and ancient races
our investigation we are surprised at the great variety of
which have been used to supply the need of a circulating m
Shells, for instance, seem to be one of the earliest forms of
They are to be found at present among the Indians of Alask
Solomon Islands, while accounts of leather money seem t
that their use was formerly more general. As the huntin
gave place to the pastoral, and animals became domesticat
animal itself, instead of its skin, becomes the principal form
money. There is a great mass of evidence to show that, in t
different regions and at very different times, cattle formed a c
for pastoral and early agricultural nations. Alike among
barbarous tribes and in the survivals discovered among c
nations sheep and oxen both appear as units of value. T
find that at Rome, and through the Italian tribes generally,
and sheep formed the oldest medium of exchange, ten shee

[1] F. A. Walker, *Money*, p. 57. [2] E. B. Tylor, *Anthropology*, pp. 281-282.
[3] Tylor, *loc. cit.* [4] Whymper, *Alaska*, p. 285.

l equivalent to one ox. The recognition of these objects as
l legal representative of value, or, in other words, as money,
traced back to the epoch of a purely pastoral economy. A
landic law bears witness to a similar state of things; while
ous fines in the different Teutonic codes are estimated in
The Latin word *pecunia* (*pecus*) is an evidence of the earliest
money being composed of cattle. The English *fee* and the
term *feudal*, according to its most probable etymology, are
from the same root. In a well-known passage of the *Iliad*
ne of two different sets of armour is estimated in terms of
The Irish law tracts bear evidence as to the use of cattle as
he measure of value in early Irish civilization. Within
few years it has been prominently brought before the public
n form the principal wealth and the circulating medium
the Zulu and Kaffirs. On the testimony of an eye-witness
ssured that, "as cattle constitute the sole wealth of the
so they are then only medium of such transactions as involve
e, payment, or reward."[4] We find that cattle were in
the pastoral Indian tribes to the United States Government
he prominence of slavery in early society led to
that slave would be adopted as the measure of exchange and
he measures of value in the Irish law tracts
ordinarily measured a female slave. They were at present employed
purpose in Central Africa and also in New Guinea; and
to the agricultural stage a greater number of objects
pable of being applied to currency purposes. Among these
e used even at present in Norway, where dried cod-fish
nd tea. The most remarkable instance of such a currency
being used as currency is to be found in the
we adopted as legal tender by the English Government in Nova
a. Another class of articles used for money consists of
nt, which among all uncivilized tribes is a highly prized
equa doll mentioned before as a token of betrothal
whales' teeth among the Fijians, and by other tribes among the
South Sea Island tribes, and finally any article of food which
can be easily worked. Manufactured articles of the same
ne under the preceding head form a more civilized form. Thus
s used in Abyssinia and Mexico, while the metallic sphere,
which will require a more careful examination, has in
n finally driven all of them into a secondary competition, and
nd have become the sole substance for money proper.

Metallic Forms of Money. Their Superseding other Substances. Special Advantage of Silver as Money.—The use of metals as a form of money can be traced far back in the history of civilization, but, as it is not possible to obtain the historical order of their respective adoption for this purpose, we will take them in the order of their importance, beginning with the lowest. Iron, judging from the statement of Aristotle, was extensively employed as currency in a remarkable instance of this which at once occurs to the mind is the Spartan money, which is clearly a survival of an older system that had died out among the other Greeks. Though by modern writers it has been attributed to a deliberate

In conjunction with copper, iron formed an early
se currency, and till recently it was a subsidiary
e in Japan. Iron spikes are used in Central Africa.
Adam Smith notices the use of nails for money in
nd.[6] Lead has also served as money, as it does at
t in Burmah. Copper has been more widely employed
either of the previously mentioned metals. Its use
as a parallel standard with iron has just been men
. The early Hebrew coins were chiefly composed of
ile down to 269 B.C. the sole Roman coinage was
y of copper. Till a very recent period it formed the
gal money of some poorer European states (as Sweden),
as the subsidiary coinage of the United Kingdom till
esent bronze fractional currency was introduced. In
ot so favourable a material for money as copper, but
rly English coinages were composed of it, probably on
t of the fertile tin mines of Cornwall, and in later
halfpence and farthings of tin have been struck. The

next metal which comes into notice is silver, which
the last few years was the principal form of money
even still is able to dispute the field with its most formi
rival. It formed the main basis of Greek coins, an
introduced at Rome in 269 B.C. The mediæval mone
principally composed of silver, and its position in
times will have to be subsequently noticed more at le
Gold, which is the most valuable of the metals widely
for monetary purposes, has been steadily gaining g
with the growth of commerce. The earliest trace of
in common with that of silver is to be found "in the pr
of the ancient Egyptians weighing rude checkers of
of gold and silver."[7] The only other metals used for
platinum and nickel may be briefly disposed of.
former of these was coined for a short time by the R
Government and then given up as unsuitable. The
is only used as an alloy.

The examination of the form of currency, both m
and non-metallic, in which we have been enabled
certain definite conclusions as to the conditions which
evolution of currency proceeds. It appears (1) that
metal tend to supersede all other forms of money
progressive people, and (2) that certain metals to
supersede the others. From this we are led to consi
qualities which are demanded in the precious metal more
to conclude that the presence or absence of these qu
is the reason of the adoption or rejection of any
such purpose.

(1) In the first place, it is necessary that the mate
money should be divisible, or, in other words, port
and to this condition all the commodities we have re
conform, for otherwise they would never have attain
position of being a medium of exchange. This q
then is not the reason for the preference of one form
others. (2) The second necessity is that the
of the article shall be in some proportion to its we
both as to put the one with another we may
that it shall be portable. Want of this quality has
fatal obstacle to many early forms of money, notwithstan
place. Skins, furs, and tobacco were found very d
to transfer from place to place. Iron and co
suffer from the one defect which disqualified exce
moreover these articles were perishable. (3)
further demanded that the material of money shall
same throughout, or that one unit shall be equal in
to another. This is a second reason for the wide
currency enjoyed by coin, as the difference between
and another head is of course often considerable
metals possessing a uniform character in the re
often become rare if they are directly employed
(4) A fourth reason is that the substance should
convenient size, developed and moulded, united
heated, to the desired form, peculiarly possessed
metals as they are rarely tarnished, while alloy or p
tion often greatly diminishes by detection, and it must
be added that the amount is connected with regard to a
(5) Money must also be durable. This at once r
from the list of metals for money all rarer ones
very deficiency. Iron, copper, or bronze would
speedily worn away. Iron, too, is liable
such substances as have a base value, i.e. are not
to currency. (6) Money should be easily divisible
and there should be no trouble in ascertaining it
The condition is one of the reasons why precious
have never been much used as money, there are
to estimate. The same objection applies to mo
metallic currencies, and is only obviated even in th
by the process of assaying. (7) The last condition

s desirable for the money material is, that its value steady. This, however, is of but slight importance societies, and it is only as deferred payments become ant feature of industrial life that this requisite is ected. It is enough for the other purposes of money shall not vary within short periods, which is found feature of metals, and especially of silver and gold, ose especially varies widely in value from season to From the foregoing examination of the requisites le in the material of money it is easy to deduce the l law, which the history of money discloses, since compared with non-metallic substances, evidently those requisite in a great degree. They are all , homogeneous, divisible, and recognizable, and in of these superior advantages they are the only es now used for money by advanced nations. Not case different when the election has to be made the different metals. Iron has been rejected of its low value and its liability to rust, lead from ense, tin from its tendency to break, nickel, as well as copper also, are ineligible ir low value, which hinders their speedy transmission adjust inequalities of local prices.

limination of these metals leaves silver and gold as suitable material for forming the principal currency. years there has been a movement toward the n of the latter as the sole monetary standard, silver egarded as suitable only for a subsidiary coinage. this question, which is reserved for subsequent on, may be regarded as the principal matter of ssy in connection with metallic currency. The special of gold and silver which render them the most material for currency may here be noted. The t the metal changes only by low degrees; they ily divisible into any number of parts which may ited by means of fusion without loss, they do egrate by being kept; their form and compact make them difficult to counterfeit; their cost of pro especially of gold, is considerable that they great value in small bulk and can of course be ted with comparative facility and thereby). The power common to both these metals of all these needful in money more fully and forcibly Contrast which for example that gold and silver alone small volume of equal exactness, ease of transport without loss, easily marked by natural and brilliant, able almost to eternity. The view has been to an extreme form in the proposition of Turgot, y became universal money by the nature and force , and pendently of all convention and law, from he declaration has been drawn that to prescribe silver evolution of the nature of things.

Origin, Function, and the Principal Questions The development of monetary system) can be traced down to the establishment of metallic in the early stages of their existence, by weight. The Hebrew records bear witness to the Greek writers. Aristotle, for example, the circumstances which led to the of exchange, proceeds to point out that it was and determined in value by men putting a stamp , in order that they might save them from the trouble thing it.[4] There are two distinct stages in the introduction of coining. In the first, only the quality fineness of the metal is denoted by the stamp, no being made to fix the weight. In other words, the acts as a kind of *hall mark*. The Chinese cubes may have been the earliest money. Herodotus attributes the first use of coined gold and silver to the Lydians; in another passage he mentions that the first Greek was at Ægina, by Pheidon of Argos.[6] The second was to certify the weight as well as the fineness of metal, thus completing the invention. The necessity preventing any interference with the coin after it has been stamped led to the adoption of a regular form, and, while hexagonal or octagonal coins are to be found, the normal shape of a coin is that of a flat circle, each side of which stamped, as well as in many cases the edge. By this contrivance all persons into whose hands the coin came guaranteed as to quality and quantity, and we may probably infer that the great improvement in coinage which the Grecian colonies was the effect, and also in some measure the cause, of the expansion of their commerce in the century B.C. From Greece the art of coining spread, Italy being introduced by the Greek colonists in Italy. Since then coinage as an art has always existed in the more advanced societies. The progress of invention, however, does not end with the introduction of the art of coining, since a number of practical questions arise in reference to the best system to be adopted, which in a more protracted period present great difficulties to those who are called upon to solve them. One of these, before the public, is What is the best shape for coins? The answer has usually been in favour of the circular, but square and other pieces are also to be found.[7] Closely allied with this is the question of the most suitable limits of size. The inferior limit is plainly fixed by the convenience of those using the coin. They ought not to be so small that they can be easily lost, or can with difficulty be taken up. In cases of violations of this principle occur in the case of the English threepenny piece and the American one dollar gold piece. The superior limit is a more difficult point. Its determination turns partly on the difficulty of forming large pieces, and partly on the facilities which large coins afford. The American gold double-eagle gives proper treatment. It is an easy process to drill a hole which can be concealed by hammering, while in some the coin has been sawn in two, and the interior removed the outside surfaces being soldered together; platinum is put in the midst to maintain the weight. A general rule it may be laid down that no gold coin larger than the English sovereign, or silver one at all than the half-crown, should be issued. Another consideration to be borne in mind when determining the size of coins is the relative amount of wear which takes place. Experience proves that large coins are less than small ones.[8] According to experiments made at the mint in 1853, the loss per cent. per annum on half-crowns is about 3s. 6d., on shillings, 4s., and on sixpences, 7s. This result has been confirmed by other inquiries. It thus follows that the larger coins are less expensive in their use. Limited by the fear of their being taken which. Again, the character of the stamp to be im

[8] Jevons, *Money*, p. 155.

natter requiring much care. The objects aimed at posing the stamp are (1) to prevent the coin being rfeited, and (2) to prevent any of the metal being ted. The former of these objects can be best at by making the device such as can be obtained only verful and expensive machinery. The most improved ds must be adopted, and the greatest pain taken t the device perfectly executed. The latest improve in the process of coining is the introduction of the oint press. The latter difficulty is best obviated by special care in marking the edges of the coin. Ancient were issued with unstamped edges which presented pediment to clipping, but modern coins at least those size, are protected by the edge being milled or by a being inscribed round it. The combination of milled with a raised legend would be a still more effectual of protecting the coinage from interference.

other matter of importance in the process of coinage nature and proportion of alloy to be used. The ity for some mixture arises from the fact that gold lver are both naturally soft, and, to obviate the, cop s been mixed with them, so as to produce a harder nce. The Austrian ducat is the nearest approach to among the principal coins of Europe, being com of seventy one parts of pure gold to one of alloy. English gold coins are eleven twelfths pure gold, while lver ones are thirty-seven fortieths pure silver. The of the difference is purely historical. The general proportion is nine tenths gold to one tenth alloy, while e coinages the proportion of silver to alloy is nearly o one, the countries composing the Latin Union g adopted that proportion in order to reduce their r silver coins to tokens. Copper is the usual material oying, but the Melbourne mint used silver for some It is this silvery alloy that accounts for the yellow rance of many Australian sovereigns. These, however, pidly disappearing, as it is profitable to melt them.

It has been mentioned above that the wear of coins is greater than that of large ones, and it e added here that the wear of coins in general is an tant question in connexion with their legal circula- The English sovereign is believed to remain above ast current weight for from fifteen to twenty years. e technical processes of coining, &c., reference may be to the article MINT.

next topic to be considered is, Who should issue y? In the earlier stages of currency the question ot so prominent, but the establishment of comme ht it forward. In Greece each city being autono claimed and exercised the right of freely coining as d, the coins being, of course, received in other cities t their real value. The consequences of this system generally beneficial. The Greek coins were usually their nominal value, as debased coinage was unable culate beyond the place of issue, and therefore ex ly inconvenient to the members of the state issuing Under the Roman republic private persons were bly allowed to bring metal to be coined, though the seem generally to have had the name of one of the ls for the year on them. Under the empire the ne became established that the right of coining be l exclusively to the emperor, and till the fall of the ern empire this was acted on. After the establish of the various barbarian kingdoms, each sovereign ed the privilege of coining, a right which in France xtended to or rather usurped by the principal nobles.[2] gland the king alone coined silver.[3] At present the control of the operations of the mint is completely hands of the executive; and, until recently, no ques theoretical grounds as to the propriety of this meth ever been raised.[1]

In close connexion with the right of coinage the consideration as to the proper persons to be expense of the process. At first sight the answer plain enough. Coins are a manufactured article as much as plate, and are rendered more valua being assayed, weighed, and certified. It appears fore quite proper that those who bring metal coined should bear the expense of the coinage, other words, should give up a part of the metal mint, this payment for the service rendered to them same manner as those ordinary letters pay the post partment for their transmission. This course ha nally adopted. England, however, has taken a d line. In order to encourage the coinage of the p metals, no charge was made at the mint beyond t volved in the necessary delay in the operations, and at present the coin with gold. Though this arran was originally introduced in obedience to the princ the mercantile system which regarded gold and s being peculiarly wealth, it may be defended on re ground for it is the expense of the mint is very compared with the amount of coin turned out, and coin produced received by the nation, so that the re expense may quite fairly be defrayed from the r revenue. Again, as the profit on the silver coinage to circumstances to be subsequently discussed i that may be set off against the free coinage of gold charge levied on coinage confined to the expe curred, is called *seigniorage*, but is anything above th it is known as *seigniorage*, which latter term is al to denote both kinds of charge. The effect of sei ture the term must be extended so as to cover th of coins is to lower their, in fact as Locke has seigniorage is always a kind of depreciation, unle paired with limitation. If the true quantity of m in circulation there will be a greater number of coi therefore nominal price will be higher. It is, h possible that the increased prices may check the tion of the precious metal, thus making the value metal higher than it would otherwise be. Whet will happen or not depends on the actual condit production, and is incapable of being predicted. advantage which undoubtedly results from a ch coinage is that it check the tendency to melt coi exported, for where a seigniorage is imposed co more valuable than the uncoined metal by the am the seigniorage. It therefore becomes the interest holder not to melt down the coin, as in doing so the extra value given by the coinage. Another ta the expense of currency is the loss which arises t wear and tear which money undergoes, and the con ing pieces. The l largest item is the interest the total amount of m

proper to observe that coin may be debased in
ifferent way (1), by diminishing the quantity of
of the metal of a certain standard of which any coin
given denomination is made; (2) by raising the
l value of coins of a given weight and made of a
metal of a certain standard, that is, by making them c
or legal tender at a higher rate than that at which
passed before; (3) by lowering the standard or fineness
the metal of which coins of a given weight and denom
tion are made, that is, by diminishing the quantity of
metal and proportionally increasing the quantity of all
The last of these methods is the most dangerous, since
detection of it is more difficult, as it is so much easi
discover the weight than the fineness of the metal in a
but all of them produce the same results and are ad
for the same reasons.

Early Debasements. The first debasement of coinage known
an good evidence is that of the Athenian coinage by Solon in 59
In order to overcome the severe distress of that period in Att
reduced the quantity of silver in the coins more than 25 per ce
that 138 new *drachmae* (the standard Athenian coin) were only e
but to 100 pieces of the older coinage. This proceeding was pe
mitted by the general state of things previously existing and
boosted since. It is probable that another debasement
gold coinage took place at Athens in 168 B.C. during the str
pensive war. We should doubt have been met on the
this determined. It may, however, be said that general
the time maintained the standard of money, though
be were not secure for dishonesty in this respect. The ex
ordinary coinage is no proof of a tendency to defra
as it was regulated at a certain substance, and issued at
allowance to the expense of coining. As remarked befor
comparative novelty in relation to the coinage may be
explained by the ne ent of the Greek states so that a de
coinage was unable to circulate beyond the boundaries o
foreign state. The best perception of the more advanced
banker and check takings on this subject may have also
prepared to these results.[1]

Early Depreciations. The earliest Roman coinage was
posed of an alloy of copper (*aes*), and this continued unc
ged the time of the First Punic War. Silver was introduc
ut the proportion between it and the more upper
bout 300 B.C. The upper currency was first debased during
Punic war at the most critical period of the Hannibalic
ne; the Roman had declared the silver and copper coin,
the legal value of the silver currency more than a third, and
gave coinage an above the value of the metal.[2] Soon afte
the upper money whose successive debasements are re
ably[3] came to have been reduced to the position of a
currency, so that it is not really a case of debasem
Ireland. The silver *denarius* which at first was gi
hundredth pound, had been debased to $\frac{1}{84}$th of a pound. In 9
number of plated denarii were issued at the rate of one for
genuine pieces issued. This proceeding, which was simp
the Republic was proposed by Drusus, but in 81 B.C. a pr
for calling in the plated pieces was passed, and was extr
popular. It is probable that a slight debasement took place
Sulla; and one of the Cornelian laws seems to state the co
of the theory of money.[4] The denarius was lowered under N
Claudius, while the later period of the empire is a se
continued to decline with the currency. The gold *aureus*
hundredth of a pound but at the time of Augustus it was only
which under Constantine it had come to be only $\frac{1}{72}$d. The
currence of Hellenic with Roman monetary history seems to
that a considerable number of small states, all issuing coin
were liable to meddle with the standard than the mint of a
large empire. It also proves the value of an acquaintance
monetary theory, if we can judge by contrasting the views
Greek thinkers with those of the Roman lawyers.[5] A few wo
may here be added against the danger of a careless
reliable, as expressed in ancient or even mediaeval
ideas of time. It is extremely hard to acce

given by any ancient writer, since the varying factors necessary be estimated are so many, viz., (1) the weight of the coin, purity, (3) the value of the monetary metal at the time, value of the commodity sold in relation to other things, question whether the commodity was in its normal state as supply and demand; to all these may be added (6) the ty of determining whether the figures have not been altered the fall of the Western empire the various barbarian sove adopted silver as their principal coinage, combined with eatest diversity in the systems adopted. On the revival of pire under Charlemagne an effort was made by him to establ general system of currency based on the silver pound a and thus corresponding to the unit of weight. This system troduced into England, and thence into Scotland; but the decay of the Carlovingian empire prevented the uniformit preserved in these different countries, while the differen ments in each produced widely divergent systems, which quire separate notice.

Debasements. The first debasement undergone by the h silver coinage was in 1300, when Edward I reduced the t of metal in the coin by 1½ per cent., or, in other word shillings and 3 pence were coined out of the Tower pound of 20 shillings as previously. This was the prelude to a of changes which were carried out during the next three cen and which terminated in 1600 when the pound troy of was coined into 62 shillings—a debasement of about 7 been devised. The reduction carried out in 1601, when shillings were coined from the troy pound, was a most mutation of its value in discharging debts, for it was in and the Scots up to

The [illegible] of 12 as well as by the abolition of the pollard in 1 silver at the mint. The pound Scots from 6th Henry to 6th Edward VI. 1-43 Edward I. has been peculiarly noted Liverpool as a time of peculiar interference with the coin metal. The old proportion of 11 oz. 2 dwt. of metal to ts. of alloy, was altered to 10 oz. of metal per pound to or one half, 1 oz. of one third, and this was fixed to pure metal and 2 oz. of alloy. A tendency to reduction under Edward VI., and was carried out in the coinage of 1560, which is generally known as the pound. Various proposals to depreciate the silver coin were made since then and on different occasions, especially in 1600. The most remarkable of the minor changes for debasing the standard was that of Lowndes, which advanced in 1695 when the discussions preparatory to the re of 1696 were being carried on. Lowndes proposed to make the pound troy of standard silver more by 1/6 than 25 per cent. He was supported by Locke, who in his *Several Papers concerning Raising the Value of Money* contributed materially to the development of monetary theory, and coinage was mainly in consequence of his views in accordance with those of Newton and Montague, based on the following principle. The first English gold coin, which is clearly proved, was that of 1257, in the reign of Henry III. A small number of gold pennies were coined in the year and added to the existing silver coins. Previously to this date the use of gold for business transactions could not have been carried commerce of the country was necessarily limited. It is probable that for the few transactions of foreign trade pieces of coins issued by the Greek emperors at Constantinople, and called *byzants*, were used.[6] Another gold coin, known as the from the place where it was first coined, was struck in 1250. The regular series of English gold coins begins in 1344, when Edward III. coined, in imitation of the florin mentioned, a large number of florins at the rate of 50 to the pound. The gold coinage was, however, for a long period only part of the monetary system, and suffered a series of the last of which took place in 1717.[7] The present English system is regulated by the Coinage Act of 1870, which consolidates previous Acts on the subject. The schedule Act, which is reproduced at p. 184 of the present volume, full information as to existing coins, their weight, tolerance, &c.

Scottish Depreciations. The coinage of Scotland was departed from primitive Carlovingian system through the influence of England, for a long period remained the same as that of [illegible]. The [illegible] under which the resources of Scotland suffered during the wars with England, as well as perhaps the example of the ally France, led the Scottish sovereigns to debase their coin all proportion to the English system. This was the reason prohibition of Scots coin as currency *de facto* in England variation in coins became so great that in 1600 the of silver, which contained about three pound sterling English made into thirty-six pound Scotch, the latter being thus time much debased. After the union of the crowns no steps were taken to assimilate the two systems, which continued as before till the complete union of the two countries. At the latter date a complete recoinage on the basis of the system was carried out, that necessary, the coins of both the countries made. The most valuable form was that of the with exception by the Scotch people, and a large amount old Scottish currency was [illegible] exported.

Irish Depreciations. [illegible] coined in Ireland the English standard in [illegible]. The Irish coinage was, of course, and the [illegible] the mother country [illegible] [illegible] [illegible]

l."[7] Similar depreciations took place in the cases of the *marcello* and the Portuguese *rei*. At the present these ... subordinate where they have not been abolished, as to little practical interest.

... Effects of the Production of the Precious ...

In considering various monetary questions it is ... to have some acquaintance with the economic ... of the production of gold and silver. The technical ... connected with the processes of preparing these ... for use are to be found in the articles Gold and ... (*q.v.*). The first point to which we will here direct ... is the field over which production extends. ... time or other these two metals have been found ... continent. Asia Minor in early times possessed ... gold, or rather amber-colour, and Ceylon also ... chiefly concerned gold mines. China and India ... produced silver to a considerable extent. Egyptian ... how that gold was commonly known in that ..., probably proceed from Nubia and Abyssinia ... opposite side of Africa too, the name of Gold ... now that the metal was there exported. Neither ... Africa, however, has been the main contributor ... (as) of money in more modern times. The ... of Carthaginian Africa were a source of supply to ... ks, and were worked as a state monopoly. At ... date the Babylonian and Assyrian empires had ... ge accumulated ... ore of gold. The Phoenician ... tions of gold from the Red Sea coasts (Ophir) are ... from Scripture.[8] The Persian kings, from the time ... levied tribute on all their provinces—in gold ... India, in silver from the ... same district, and ... part of this was stored up in the royal treasuries. ... dency of sovereigns to accumulate had all through ... history important effects on the economic structure ... At present it is quite natural to assume that the ... of money are distributed by means of international ... and tend to keep at an equal level all the world ... an assumption which is in general well grounded, ... an important exception exists. Ancient history ... a widely different set of forces in operation. Gold ... were produced by slaves under the pressure of ... were drawn toward the ruling part of the great ..., in a word, war, not commerce, was the distributing ... From this condition of affairs it is easy to see ... whatever may be the reasons for assigning to gold ... from a potent influence over the value of money in ... times (and grounds have been already advanced ... belief that this influence has been exaggerated), no ... sons then existed. The production of the precious ... metals was carried on, as the great buildings and ... works of those periods, on non-economic grounds, ... therefore produced quite different effects. The whole ... tory of the Persian monarchy to its overthrow by Alexander ... (330 B.C.) shows that the mass of the precious ... hoarded up continued constantly to increase. On the ... ture of Persepolis by the Grecian army an enormous treasure ... was found there, some estimates placing it as high as ... 120,000 talents of gold and silver (£27,600,000).[9] ... the temples, too, were receptacles for the precious metals, ... that the stock accumulated at about 300 B.C. must have ... been very great. The only causes which tended to diminish ... therefore were the losses arising from wars, when the royal ... treasuries were liable to be plundered and their contents ... persed. There was therefore a more unequal distribution of ... the material of money than at present. The growth of the ... Roman dominion led to important results, since under the ... rule the Spanish mines were developed and became a large ... source of supply. The great masses of treasure set to ... Rome, so that it became the monetary centre of the world. ... The overthrow of the Republican government and the ... peace which followed also affected the conditions of production. The inefficiency of the Roman administration ... made it advantageous to let out the mines to farmers, who ... worked them in a wasteful and improvident manner, and ... the supply of slaves was reduced, thus depriving the latter ... of their principal agency for carrying on production. The ... result was a continuous decline in the store of money. ... Jacob has made an attempt to estimate the amount at the ... death of Augustus (14 A.D.), and he arrives at the conclusion ... that it was £358,000,000.[10] Without placing much ... value on this necessarily conjectural estimate, it is safe to ... assume that this period marked the highest point of accumulation.

The succeeding centuries exhibit a steady decline, but ... it is of course impossible to attach any value to even the ... most carefully guarded numerical estimates. The problem ... upon which has since so often attracted notice—the ... of the precious metals to the East—began at this time ... and was a subject of complaint to the Roman writers, ... while the stock of gold and silver being thrown into ... more general circulation suffered more from abrasion, and ... was more likely to be lost than when stored up in the ... royal treasure houses and temples. These causes tended ... to depress the scale of prices, while the barbarian invasions ... produced a strong effect on the supply by driving off ... the mining population and damaging the various installations ... used for working the mines. The conjectural estimate is, that about 800 A.D. the total supply had been ... reduced to £33,000,000 (or about one eleventh of what ... it had been at the death of Augustus).[11] A new period ... in the history of gold and silver production may be said ... at this date. The Moors, now firmly established in ... Spain began to reopen the mines in that country which ... had been allowed to fall into disuse. Other European ... mines also were opened.[11] The international system of ... currency based on the pound of silver as a unit which was ... introduced by Charlemagne must have tended to economise ... the wear of the metals. We may therefore conclude that ... from this date (800 A.D.) the supply was sufficient to ...

influential factor in the matter,[2] and look upon the
of money as increasing. The annual addition to the
of money has been estimated as £2,100,000 for the
d from 1545 to 1600. At this date the Brazilian
ly began. The course of distribution of these fresh
es of the precious metals is an interesting point,
h has been studied by Mr Cliffe Leslie.[3] The flow of
new supplies was first towards Spain and Portugal, and
thence they passed to the larger commercial centres
he other European countries, the effect being that
s were raised in and about the chief towns, while the
e of money in the country districts remained unaltered.
additions to the supply of both gold and silver during
wo centuries 1600-1800 continued to be very consider-
; but, if Adam Smith's view be correct, the full effect
rices was produced by 1640,[4] and the increased amount
oney was from that time counterbalanced by the wider
nsion of trade.[5] At the commencement of this cen-
the annual production of gold has been estimated
ing from £2,500,000 to £3,000,000. The year 1809
s to mark an epoch in the production of these metal

ates.

dependencies in South America tended to check the
supply from those countries, and a marked increase
value of money was the consequence. During the
1809-1819 the value of gold and silver rose to about
and a half times their former level, notwithstanding
discoveries in Asiatic Russia.[6] The annual yield in 18
estimated at £8,000,000. The next important da
our present purpose is the year 1848, when the Cali
mines were opened, while in 18 of the Australian disco
took place. By these events an enormous mass o
was added to the world's supply. The most
estimates fix the addition during the years 1851-1
£500,000,000, or an amount nearly equal to the
stock in existence. The problems raised by this
menon have received the most careful study by s
distinguished economists,[7] to whose writings those de
more extensive information may be referred. The main feat
interest may be briefly summed up. (1) The addi
supply was almost entirely of *gold*, thus tending to p
a distinction between the two principal monetary
and an alteration in the currency of bimetallic cou
Under this influence France, from being a silver
became a gold using country. (2) The contem
poral development of the Continental railway sy
and the partial adoption of free trade, with th
expected facilities for free circulation of commodit
to the course of distribution being different from
of the 16th century. The more backward districts
metal equalizat
price combined with
ght elevation in value w
come. (3) The increased supply of gold tend
general currency to retain possible, and made the use of
monometallic standard appear tenable. The move
for currency reform, as will be seen, all arose after
discoveries. (4) The change in the value of money,
may for the period 1849-1869 be fixed at 20 per
enabled a general increase of wages to be carried on
improving the condition of the class living on
labour. It may be added that the difficulty of trac
effects of this great addition to the money stock is
triking proof of the complexity of modern ec
development. (5) The last point to be noticed is th
small influence exercised
value of silver by t
gold. Hardly had the
discoveries of 184
ceased to produce a decided
effect when new silver
of nominal fertility came into work. During the
immediately succeeding the gold discoveries the p
tion of silver remained at an annual amount o
£2,000,000 to £3,000,000. This amount sto
about 1870, increased to £4,000,000,[8] and rema
that amount for the next five years. More than
the supply came from new mines opened in N
This increased supply was accompanied by a
depreciation in the gold price of silver, though th
of commodities in countries having a silver stand
not rise. The result of the close investigations to
all aspects of the question were subjected was t
that the increased production of silver was only
sufficient to counteract the depreciation. The policy
various states of Germany and the Scand

The Report may be more important after 1873.

The following may be profitably consulted: Cliffe Leslie, *Essays in Political Economy* (Dublin, 1888); Cobden, Tooke, see Newmarch, *History of Prices*, vol. vi. pp. [illegible]; Evans, article "Precious Metals," *Encyclopaedia Britannica*, 9th ed.; J. E. Cairnes, *Essays on Political Economy* (London, 1873), pp. [illegible]; W. Stanley Jevons, *Investigations in Currency and Finance*, pp. [illegible]; W. [illegible], *Essays on Monetary Questions of the Day*.

The price of silver in London was 59d. per oz. in 1871, and 60d. per oz. in 1872, or 2½d. per oz. more than in 1873—that is, only 3 to 4 per cent.

three heads: (1) The proper standard to use, the dis
of which in practice turns on the comparative mer
single standard of gold or silver and of a double st
of gold and silver at a fixed ratio; (2) the system
dividing the currency, which is generally discussed
the of proposals for decimal coinage; (3) pr
made in many quarters to assimilate the various c
systems of the world. These take one of two
it is either desired that a group of nations shall ass
their currencies, in which case the coinage may be ca
international one, or a wider view is taken, and
system is advocated for all states. This may be
universal coinage. The question of the proper st
may be deferred for the present, as it is of a more c
nature than the others. Before discussing even the
of the question it is desirable to state some elem
tacts involved in all such points. Every currency
must be based on a *standard unit of value* which
of a "fixed quantity of some concrete substance defi
reference to the units of weight or space." Th
English unit is the *pound*, which consists of a
quantity of gold (123·27447 grs. standard fineness)
the French unit is the *franc* (composed of 5 gran
silver 9/10ths fine). It is not, however, necessary th
standard unit shall be a coin. All that is needful
the current coins shall be multiples or submultiples
unit, or at all events easily reducible to it. The
centime is too small to be coined, and the pound o
which formed the unit of the early French and
currency was too large. Distinct from both the
coins and the unit of value is the *money of account*,
in practice it is usually identical with one of the
Russia in early times the *rouble* was an imaginary
of account not coined, while the copper *copeck* was t
of value. Another distinction must be pointed out,
that between *standard* and *token* money, the forme
of the same value as the metal it is made of, while th
is rated at a nominal value higher than that of its m
The silver and copper coins in England and the
silver coins in the Latin Union are merely tokens, b
the case of the English silver coins about 30 per cent
their nominal value. The French coins are of
fineness (835 per 1000). Token coins are only adm
in small payments, as otherwise — in accordance with
monetary principle to be presently explained — the s
coin would be driven out of circulation. The ma
amount in payment for which they are legal tend
England 40s. One of the functions of money b
afford a standard for estimating deferred payme
is generally used as the means of discharging obl
when they become due, and in this aspect is style
tender. The principal coinage of any country is lega
to an unlimited amount, and, when offered, dischar
pecuniary obligation. It is only the standard coinag
possesses this property, or rather the standard co
that which does possess it.

In discussing monetary questions it is also impo
remember that a metallic currency has to circulate
the most diverse classes of society, and must be s
the wants, and even to the prejudices, of the pop
ment. Many curious instances the preferen
community for some particul could be given
Austrian Maria Theresa dollar a special favourite

to the habits of the people not having been attended
ome writers have, however, misconceived the prin-
of currency and extended this influence to cases
it does not apply. Thus it has been sought to explain
option of gold as the principal English coinage after
y assuming that the English deliberately preferred
etal.[1] The fact of different nations possessing dif
currencies, as the prevalence of gold in England and
r in France during the 18th century, is to be other-
ccounted for. The great mass of a population, it is
ake and give money without particularly observing
is enough if the coin conforms to the usual type
exists, however, in all mercantile communities a class
lers in money[2] who make a profit by collecting the
oins for exportation, or, if two metals are in concurrent
e coins of that metal which is undervalued in the
tion fixed. The mode in which self-interest thus
es produces an effect which may be briefly formulated
ing that *bad money drives out good money*. It is
now called "Gresham's law," from a former master of
nglish mint,[3] who observed it. The illustration of
rking are numerous. Under its action the gold which
vervalued relatively to silver in England in 1696
e the main English coinage, as above stated. And
er to meet the want of silver coins, Sir I. Newton
ated, and secured, the reduction of the guinea from
d. to 21s. The exportation of metallic money when
er-issue of inconvertible paper takes place is another
f the theorem. By means of this principle we can
explain the tendency of currency to depreciation, for
once, either by wear or by the issue of inferior coins,
ency has become debased, no reformation is possible
the debased coins are removed from circulation, as
wise they will be preferred for payments by dealers,
ill not be melted down or exported. All demands for
n trade will be met from the best part of the coinage.
gument in favour of state coinage has been founded
reshain's law. It is argued that private coinage
lead to the issue of depreciated money.[4] It is,
ver, overlooked in this argument that the action of
w arises from the fact that the depreciated currency
l tender; were it not so, comes less than the proper
t would be at once rejected. It may be added that
monetary history bears out this view.[5]

ving disposed of these elementary questions, the
l groups into which all currency systems fall may now
ted. The simplest form of currency seems to be that
ich the state coins ingots of different metals, and
s them to circulate freely, without any ratio being
This, which is the lowest form of currency proper,[6]
risen in many countries through the introduction
of various other nations. Turkey is a European
le. Many of the South American republics possess
ency of this description. A theoretical form of this
n has been advocated in France. It is proposed to
coins of one, two, five, and ten grammes of gold, and
ow the present silver coins which are multiples of the
ne to circulate along with them. The difficulties of
lan are so obvious that there is no likelihood of its
adopted. The arguments in its favour are of little

force, since it is hardly correct to contend that it
natural system, when it has never been willingly adopt
any country. The next system to be noticed is tha
single metal being fixed as legal tender. This in
times is the really natural arrangement, and has
widely adopted. It is needless to recapitulate the ins
which have already been given in dealing with
matters. There is, however, a difficulty which soon
under this system. If the metal chosen is not
valuable, it is too cumbrous for large payments; if,
other hand, it possesses a high value, it is hard to
able. The even
would be too bulky for such payments as frequently
£100 in silver at its present value would weigh nea
lb, while it would be impossible to coin gold pie
the value of a penny or even a shilling. This system
naturally lead to the use of other metals beside
standard one, and when the state fixes the ratio be
the metals a new system has come into existence,
has been called the *multiple tender* system. In
ratios between the metals are fixed, either once for
until changed by state authority. This system w
force in England from 1257 (or rather 1344) to
the ratio between gold and silver being fixed from t
time by proclamation. France, too, adopted it duri
Revolution, the ratio of 15½ to 1 being that fixed be
gold and silver. The fluctuation of currencies ar
on this method, owing to the action of Gresham's la
led in England and Germany to a modified system,
seeks to combine any advantages of the multiple st
with the principle of the single standard. By this
one metal is fixed as the principal legal tender, wh
smaller coins are made of a less valuable materia
circulated at a nominal value somewhat above the
one, or, in other words, as token coins, but they ar
legal tender to a limited amount. This has been
the *composite legal tender* system.[7]

For further details reference may be made to Tables II a
and the notes appended. Every currency system requires th
existence of subsidiary coin, and, as stated before, this want is met
a less valuable metal, generally silver, and for smaller pa
copper or bronze. But apart from the question of the ma
the smaller coins, it is important to determine the legal ratio
them. The simplest of all would be the *[illegible]*. In it
would be the limit to the [illegible] and double the one
ounces below it. Notes, apparently a plainer or simpl

a large series of coins to be formed.[1] The main reason, for the adoption of a duodecimal system appears to have preference for the number 12 so frequently shown by early , that among the Semitic races, the Jews were organized ribes , and in Italy the Etruscan league consisted of two ; and Rome In connexion with this it may be noted duodecimal system of currency prevailed south of the Apen At Rome the *as* was divided into 12 *uncia* The modern however, has been to adopt a decimal scale This method ion, which is found very widely in use among savage tribes, to be derived from the ten fingers of the human hands. the basis 10 is not so convenient as 12 it is firmly established nal system of counting, and is in process of extension to weighing and measuring.[2] For the purposes of currency this s is not very convenient, as 10 can be only resolved into two fac and 5), and one of these is a rather high number. This advantage has retarded the adoption of decimal coinage, and is base of the objections made to it. It has been contended that unsuitable for small purchases, and for such fractions as one-thi France adopted the decimal system of coinage in 1799, and it now extended over all the countries of the Latin Union (see T II.). It is also in use in Germany, Denmark, Sweden and Norw the Netherlands, and Finland, as well as in the United States none of these countries has a decimal coinage pure and simple.

(Mr Grasch in *Econ. Journ.* Dec. 1891, art. "Money," vol. xv. p. 444 et seq.)

nt circumstances appeared. The
our monetary system was thus left open
when means of facility for intercourse hav
international relation. And accordingly
ts, necessary and convenient was found in Eu
advocated this principle. In pursuance of
conferences and congresses were held on it
them in 1865. The
a series of important resolutions. It reported advocating the
convenience of a decimal system with a uniformity common to
the multiple and sub-multiple of 5000 to the unit of the higher coins
approved of, as well as the determination of the weight of coin
metric system. The first practical outcome of the movement
the monetary convention of 1865, which founded the Latin Union, by which France, Belgium, Italy, and Switzerland
came a single monetary region, with the franc as their common unit
sequent accessions to the Union are given in the note to the
coinage system (Table I.). In 1867 a monetary conference
d at the same time as the Exhibition of that year, when the
universal coinage was advocated, and three leading principles
down as necessary to that result, viz. (1) the universal
of a single gold standard, (2) the general use of the decimal
this coinage, (3) that all coinages should be co-ordinated
French system.[5] Owing to the accidents of historical
ment, certain points of connexion existed between the lead
open systems. Thus, the franc being regarded as a unit,
man thaler was as 2·47, the American gold dollar as 5·18,
English pound as 25·22. Very slight changes would bring
one into a ratio of 1 : 5 : 25, and it was proposed by the
of 1867 that, when this was effected, they should have inter
in all countries where any of the four unit-pie
Friendly nations were recommended to select whichever
most frequently used. The subsequent monetary changes
Europe have, however, ended rather in
of the existing systems without any tendency towards
establishment of a common one. Thus, of the three principles
down by the conference of 1867, two only have been adopted
the currency reforms. On the creation of United Germany
e Franco-German war of 1870-1871 it was the aim of the
of that country to develop as much as possible all outward
ons of that unity, and in accordance with that conception,
an currency was devised which was monometallic and decimal
ble II.), but which was not even to assimilate to the French
thus rejecting the third principle laid down by the Paris
ce, and rendering future progress more difficult. The
Scandinavian Union proceeded on very much the same lines
German reform, and was, in fact, mainly caused by it. The
Government, under the pressure of circumstances, have aban
the silver standard and coined some gold, but their position i
undecided. The Austrian Government have made a slight st
issuing a gold coins 8- and 4-gulden pieces, which are the sa
the 20- and 10-franc coins. In one part of the Russian domi
Finland, the French system has been introduced, the new
being equivalent to the franc. The main Russian system h
been changed, nor have any alterations been made by Eng
Turkey, or Portugal.[4] The question of universal coinag
become implicated with the question of the proper standard
the strong ground taken up in 1867 has certainly to some
been abandoned. It may, however, be considered that the p
systems of coinage are capable of being assimilated. A comp
of the amount of pure metal in English, French, German, U
States, and even Japanese coin shows how small is the differ
An recognition proposal was made in 1868 to the English comm
on the question, by which the sovereign would be made ide
with the French 25 franc piece (if that were coined). It was
on the fact that the sovereign contained only about 1 grain
of gold than the amount in 25 francs. It was proposed to
the small amount from the bullion brought for coinage as sei
age so that no change need be made. The advocates of this s
contended that price would not be affected by the alteration.
recommended itself to the commission. They ac
the view put forward by Newmarch, who argued that all
tracts would have to be altered to allow for the depreciation
by the change, and this portion seems impregnable, so l
metallic currency alone considered. Another ingenious pla
that of Bischof to assimilate the English and American syste
a step towards a wider change.[6] At the present moment the
monetary system of (1) France and her allies, (2) England a
larger part of her colonies, and (3) the United States are so
established in these several countries, and the advantages o
system are so equal, that it is hard to see which is to give
The wide area of the Latin Union, and the perfect decimal di
of its coinage, are arguments in favour of the franc; the g
value of the pound, and the immense extent of the E
colonial and English trade, are in favour of the British u
verse, while the dollar, from its convenient size and the pr
of the future growth of the United States, has claims to b
selected in the discussion. The most probable conclusion, ho
seems to be that the future unit will not be any of these coi
the result of a compromise, which will lead to a new system
established. The difficulties which arise when universal c
scheme are brought forward ought not to conceal from us th
advantages which such an institution would confer on the
The arguments urged in its favour are various, and are regar
being of different relative importance by their advocates.
may, however, all be stated as follows. (1) Increased faci
travelling. Though there is a tendency to under-estimat
element of the question, it seems impossible to doubt th
saving of trouble to travellers by any universal coinage
would be very great. The abolition even of the local curren
Germany and Italy, and their replacement by uniform m
systems, has been a great boon to tourists, but an arrang
which would obviate the necessity for procuring any di
money whatever would be a still greater advance. In the in
of peace, which is greatly promoted by extended interna
communication, it is very desirable to remove any obstacle
towards increased intercourse among persons of different cou
(2) Greater ease in adjusting the foreign exchanges. This arg
has been sometimes pushed too far. It has been apparentl
that, were a universal currency adopted, the problems of the f
exchange would no longer exist. There are, however, other
in the question, namely, those of time and place, which could
eliminated by the adoption of a single coinage system.[7] St
removal of even one complicating element would simplify exc
discussion. The question of mint pars would no longer aris
the specie points would be stated more simply. The friction
sometimes arises from the necessity of recoining the exporte
would also be removed, and the profits of those dealers who g

[4] Austria-Hungary and Turkey possess inconvertible paper cur
and various foreign coins circulate in the last-named country, the q
does not possess much importance for them. Portugal is closely co
with France and will probably follow her example. It may also be
that the gold coins of all these countries have a fineness of $\frac{11}{12}$ths.

[5] Sovereign = 7·32 gramme fine gold.

[6] See his pamphlet reprinted from the *Economist*. It is nearly the

pecial knowledge would be saved to ordinary traders. (3) provement of the currencies of backward states. Many s still possess those mixed currencies which were once com- over Europe, and much confusion consequently arises. The cial coins have been introduced for international circulation,[1] nivetsal currency would perform their function more satis- y. (4) Greater facility in comparing price-lists, &c. This ge, which is reserved for the last, has been regarded by nt judges as the greatest.[2] It has a practical and a theo- nterest: the former, since trade with foreign countries would ered easier and safer, the latter, since statistical inquiries e very much facilitated. At present, it is quite impossible rdinary trader to understand a set of foreign price-lists, each expressed in terms of a different currency from the other. alty which is enhanced by the variations of gold and silver iod to add the case of an inconvertible paper currency. The e of a common monetary language would remove the second, and the premium on gold could be allowed for in the case erated paper. A much wider development of credit-trading ions would become possible, and would add to the wealth

Nor would the greater ease of statistical comparison be unim- ; the rates of wages in different countries and the prices ent transactions, would be readily compared, and the move- of labour and capital to the most advantageous points l more rapid. Against these great gains can be set only and a possible disadvantage, namely the [illegible] l in charge, which would, of course, for the time be con- e, but would soon be over, and the chance that some [illegible] same a depreciated currency, which would expel the other er coins. In the case of a universal coinage the [illegible] would arise, since there would be no field of employment for the oins, and they would consequently remain in circulation. whole currency would become depreciated. Proper arrange- ons, however, would obviate this danger, and could [illegible] ed. It may be said that the principal merit to one system for all civilized states is the advantage of [illegible] the standard to be employed. Till the debate on the is closed it is vain to expect monetary unification. The ment of a universal system based on gold coined quite to the conference of 1867, but doubtful to the end of 1878, which standard was the proposal discussed in 1881.

Considerations on the Questions arising from the Con- Standards. In the preceding section the various e monetary systems were set forth, but no discussion tered into with respect to their comparative merit. ree of these systems need be here examined, namely, *gle* standard system, the *multiple* standard system, stly, the *composite* system. Nor even is there any or examining the various possible single or multiple rds. The single silver standard is the only one of mer, as the double gold and silver standard is the e of the latter, which need be taken into account ne, historical inquiry has shown that the problem of oper proportion between two different metals when ogether presented itself to the Chinese with regard r iron and copper coinages; but the course of mone- olution, as discussed in section 3, has resulted in the on of the less valuable metals and in confining the al of the principal coins to silver and gold. The use r as a principal coinage was, as we have seen, widely d. The Hellenic coins were composed of that metal, eing afterwards introduced as a variable commercial ; and copper was brought in still later as a token cy. Though copper preceded silver as money in the latter, soon after its introduction, succeeded in eing it, the ratio first fixed being 1 to 250. A regular coinage did not exist at Rome till the empire, but n bars passed, the legal ratio being 1 to 1191. Still estions connected with the use of a double standard seem to have arisen.[3] The various European mon- s had silver as their principal money (see p. 726 *sq.*, , gold where it was used being, as in Greece, a

commercial money. The advance of gold to a p parallel to silver was commenced in the 13th and con in the 14th century, the method of regulating the gold and silver currencies being by proclamation, fixed the varying ratios from time to time. In E this course was followed from the first introduct gold coins (1257) to 1663.[4] From 1663 to 1717 was the standard, and the gold coins passed at the ket value. As the silver coins were very much de the gold guinea sometimes was deemed equivalent After the recoinage of 1696 the guinea passed at 2 At this ratio silver was undervalued, and was acc exported to Continental Europe and to India. The the silver coins arrested the public attention, and the was submitted to Sir I. Newton, whose answer was in his *Third Representation*. He proposed to redu guinea from 21 6d to 21s, as an experimental me The proper reduction for the object in view would been to 20 s. 8d. The silver coins, therefore, con and England came to have a gold currency. An op arrangement gave France a silver coinage. The fact of French monetary history, as well as those United States, illustrate the same condition of affair difficulty of constituting a double standard system become latent, thus made clear so far as it has re single country. For the continuance of the two me the currency depends on the market ratio and th ratio between gold and silver being the same. The h examination of the history of these metals will ho variable they have been. Without accepting the ex which regard silver as being more valuable than go well-attested variations of the precious metals hav very considerable. Thus, Herodotus estimates the 1 to 13, Plato 1 to 12, Menander 1 to 10, and in time the ratio was 1 to 9.[5] Table I. contains the tions since the discovery of America. In the 14th c the value of gold rose remarkably, and the gradua ment has ever since been toward an appreciation relatively to silver. Another point, previously not the tendency, as wealth increases, to adopt a more v form of currency. Greece, Rome, and England all illustrations of the movement. The experience of th of a mixed currency led the earlier writers on coi England to regard a single standard system as the be silver as the most suitable metal for the standard.[6] Petty, and Harris all advocated this view. The Italian writers proposed to combine gold and silv ratio of 1 to 12, which they conceived to be the actu portion. The theory of a composite system was, as mentioned, first given by Lord Liverpool.[7] This

ulating the metallic currency was established in
l, as it were, accidentally, and deliberately adopted
1816. The practical good results which followed
ll English economists of that period warm advo-
of the composite system. Thus, M'Culloch and
ree in supporting the English system, as also does
dd.[1] On the Continent the weight of authority
as divided, and the existence of the French bi-
system gave support to the advocates of a double
d. The result of the gold discoveries in Australia
intorta was to greatly increase the supply of that
nd, under the action of Gresham's law, to change
ch currency from silver to gold, while Holland, to
he evil which were anticipated from the reduced
that metal, adopted silver as the standard. The
nts in favour of a universal currency described
combined with the course of event, brought the
l question into greater prominence. The proposal
Paris conference of 1867 for a single gold standard,
niversal coinage on that basis, raised the question
t prominence. Wolowski and Courcelle Seneuil
opposed the recommendation, the former predict
t a disastrous appreciation of gold would follow.
w seems borne out by the result, for, although a
l coinage was not created, yet Germany and the
candinavian Union both changed from a silver to a gold
d, while Holland and the United States both made
nts in the same direction by demonetizing silver
king preparations to adopt the gold. The Latin
at the same time directed their silver coinage, which
nly the same effect as the adoption of a gold standard.
The result of these extensive changes was to create
onfusion. The more ardent advocates of a double
d, too, attributed most of the continued trade de
n to this cause. The altered condition of opinion on
stion was seen at the monetary conference held at
1878, where the universal demonetization of silver
sidered to be dangerous. The "Bland Act" of the
States, which theoretically decreed the double
d (1878), was another instance of reaction. The
preciation of silver, which resulted mainly from it-
eased to be money over a large part of the civilized
severely affected the Indian finance, and thus the
ct a double standard were able to command more
n in England. The conference held in Paris in
flected these changed views. The supporters of
ble standard took the initiative and proposed a
sed on the double standard at a fixed ratio, but
lusion was arrived at. England, Germany, and the
candinavian Union upholding the gold standard.

ce has been the contributory of the bimetallic question
s become desirable to examine more closely the conflicting
s which recent shape these have taken. "Sensible Bimetallists
of the gold standard have found their best representatives
have regarded not Tooke. The former of these adopted the
t held by Petty, Locke, and Harris, that only one metal
a standard at a given time, but he held that the
ot be secured unless both selected gold as more suitable material
ver to be the principal money. He added that by law the
ver should be received to any the standard, and as a matter
he contrary would always be used practically at that time. 1850 the
standard to depreciation. These arguments were

amounts of gold and silver coined each year were as follows:

	£
1874	16,000,000
1875	13,000,000
1876	12,000,000
1877	25,000,000
1878	9,000,000
1879	20,000,000

For Italy only

for a full discussion, W. Bagehot, *Depreciation of Silver*.

supported by a mass of historical examples.[4] Tooke, who dealt
the subject in his *History of Prices*, severely criticizes the d
standard. He points out that it would be impossible to keep
metals in circulation, and that it would be the inferior one w
would remain. He also indicates a more refined objection, namely
difficulty of constituting a bank reserve under the double stan
Thus, if silver were the more valuable, and the reserve cons
mainly of it, there would be an inducement to make a run o
reserve, so as to drain out the small quantity of gold and the
the more valuable silver.[5] The silver standard was preferr
Ricardo, who fully accepted the arguments against the d
standard as conclusive, his view was, that silver was steadi
value than gold, and was the standard money in other coun
while the objection to it on account of its greater bulk wa
thought, obviated by the use of paper money for circulation.
S. Mill pronounces no opinion as to the comparative merits of
and silver, but he objects to the double standard on the
ground that the cheaper metal is the only one used in paym
and that therefore the fluctuations are more frequent under a d
standard *cæteris paribus*. The advocates of the concurrent use of th
metals, prominent among whom were Wolowski on the Cont
and Seyd in England, contended that these objections wer
founded, for (1) the double standard, though it produced
admitting the assumption of their opponents) more frequent flu
tions, still did not vary so widely from the mean, since in each
it was the *cheaper* metal which determined the value,[6] and (2
action of Gresham's law would produce a compensatory a
Thus, if silver be undervalued in a double standard system, a
ats in to other countries where it is more valuable. The qua
of silver is thus reduced and its value raised, while gold is impo
it quantity increased, and its value lowered. Were gold the u
valued metal, the converse process would take place. The se
ce of the position is illustrated by the case of the great transfo
tion of the French currency (1849-1860). During the rapid inc
of the gold supplies the value of silver only rose about 3 per c
in fact the depreciation was spread over the two metals, and
continued to gold.[7] In addition to the above arguments, it
ged by Wolowski that any attempt to establish a universal
standard as contemplated by the Paris conference of 1867 w
cause a great appreciation of gold, which would be disastro
commercial interests, while silver would lose most of its value.
services which the double standard countries rendered by acti
intermediaries between gold and silver standard countries wa
dwelt on, the ease with which the mass of silver needed for exp
tion to the East was supplied from France during the years 18
being an instance in point. The monetary difficulties, as indi
above, which followed the adoption of gold by Germany an
Scandinavian Union, as well as the embarrassment of the I
Government, from the resulting depreciation of silver, revive
double standard advocates. Cernuschi and De Laveleye
forward as supporters of what the former called *bimetallism*, t
to secure the establishment of a universal, or at all events a
international currency, based on the concurrent circulation
two metals gold and silver at a fixed ratio. This plan has g
many supporters, though the tendency among English econo
seems to be to decline even to consider it; and not even yet
the question appear to have received that careful examinatio
bimetallists which would be desirable.[8]

The bimetallists start with a discussion as to the causes w
determine the value of money. They point out that there ar
two theories: one that the value of money depends on th
of the sovereign (the *fiat* theory); the other that the val
money is entirely independent of state control, and determine
economic conditions (the *free trade* theory). Neither of th
accepted by the bimetallists. They take up a middle ground
hold that by its power of deciding what substance shall be de
legal tender and discharge all obligations, the state is able to c
within limits, what substances shall be money and wha

[1] *Evidence of the Banks*, pp. 128-165.

[2] This objection to the double standard is also urged by Prof. Th
Rogers and by Bagehot. Actual instances of the difficulty occur
1860, and again in 1876, with the Bank of France.

Macmillan, p. 402.

[4] The superposition of two curves, each representing the varia
one metal, and the formation of a third curve representin
lowest concurrent point of each, will make this clear. See Je
Money, p. 155.

[5] See J. E. Cairnes, *Essays in Pol. Econ.*, pp. 140-143.

[6] Mr. A. J. Wilson has collected a series of articles on Recipr
Bimetallism, and Land Tenure Reform, and Prof. Bonamy Price
with Bimetallism and Fair Trade in his address to the Social S
Congress in 1884. But there is no fair reason for placing É. de Lav
Luzzatti, Cernuschi, Dana Horton, and other supporters of bimet
and we may add Prof. F. A. Walker, in the same category wi
advocates of (so-called) "Reciprocity."

of those substances shall be. They argue from history that
l metals have been successively demonetised that different
have been fixed between metals circulating together, that in
ctible paper currencies have been kept in circulation by the
the state.[1] The doctrine of cost of production as determining
lue of money is also assailed by them. They hold that the
antity of money which governs its value, and that cost of
ction has little or no influence on the matter. The next topic in
metallic argument is to contend that them proposed ratio for
o silver (1 to 15½) can be maintained by the Government con-
t effect. The common objection to bimetallism, that which-
metal was undervalued would be exported, they answer that
ne ratio existing over all, or a great part of, the world there
be no inducement to export either metal, and in support
n argument they appeal to the practical success gained
ost contemporaneously in the interests of modern bimetallism
ly, a greater stability as regards value is claimed for the two
s combined than for either used singly, for the depreciation
orted over a wide field, and, the condition of profit being
nd silver being somewhat differently affected by fluctuations in their
ne balanced each other. A fourth argument consists in the assertion
e which would follow the establishment of the
ve which learnt from the existence of good
e variations of relative
allic system to appear
advantages which

? Is there not a great demand for the precious metals in the
trades? And would not the ratio of demand be affected
lxing of a new ratio? The argument of practical difficulty
y system would produce greater instability in the value of money
by the answer that there is no proof of it. It is quite
ie that a single metal may be steadier in value than two com-
and the evidence of history shows that silver is more stable
reciation than gold. The argument drawn from the disturb-
ce exchange transactions is to a slight extent admitted, but
inted out that the factors which affect the foreign exchanges
numerous, and are so rapidly eliminated in the course of
that a radical currency change need not be adopted for this
se. It is also shown that, even when no Europe
metallic, the fluctuations in the exchange price of silver took
and still more that, where it is the less valuable metal that
ourse of depreciation, bimetallism can afford no aid. The
ed tendency of the bimetallic system to produce a higher
f prices than would otherwise prevail is dwelt on by its opponents
as a proof of its inherently vicious character. The claim to
the world by adding to its stock of money places bimetal-
n the same class with the advocates of inconvertible paper
, and shows the absence of reason in their views. Their
n becomes the same as that of the Birmingham currency
The proposition that the quantity of money is of no con-
ce since prices vary in proportion to it, is one [illegible]
he contempt so frequently expressed for bimetallists is re
d for by their advocacy of the principle of the beneficial
of an increased amount of money. To the contention that
llism is the necessary condition for a universal coinage system
swers is, that the idea of universal coinage presupposes the
he *gradual* introduction of the gold standard [illegible]
ing the way for a future universal coinage based on gold
metallism. On the practical question as to the actual intro-
n of the system, the monometallists deny the possibility of

forming a universal bimetallic league which would not be
be broken up by war or impaired by some of the states-who
posed to issue inconvertible paper. On the other hand, the
international conventions for postal purposes, extradition
metrical measurement, and other matters of interest are co
by bimetallists as evidence of the feasibility of their plan.

The above summary gives the main arguments on
of the discussions as given by the advocates of the
principle. A short consideration will show that the con
may be suitably divided into three heads, viz. (1) the po
of constructing a universal bimetallic system which sha
accordance with the economic principle; (2), if the first
be answered in the affirmative, the comparative merits
system opposed to the present variety of systems or
universal gold standard system; and (3) the expedien
present circumstances of nations in general and England
other people in the proposed convention. Each of the
will be considered.[2] (1) The possibility of a bimetallic
can hardly be denied. Under all the difficulties attend
existence in a single country, it was assumed in practic
ing in France during the early part of the 19th century
a plan that a world-wide bimetallic league would afford a bet
basis than two. It is quite possible that international preference
metal or the ratio would be displaced, but the work
Under such circumstances the exchanges would be regulated by the

so quickly that the commandant at first refused to
e it the time necessary for the work had not been
; but upon examination the value of the discovery
ognized, and the method was adopted. And Monge,
uing his researches, arrived at that general method
application of geometry to the arts of construc
hich is now called descriptive geometry. But such
e system in France before the Revolution that the
s instructed in the method were strictly forbidden
mmunicate it even to those engaged in other branches
public service; and it was not until many years after
that an account of it was published. The method
s, as is well known, in the use of the two bodies or
t of paper to represent say the plane of x and z
at angles to each other, and the construction
on of points, lines, and figures in space by means
r plan and elevation, placed in a determinate relation
n.

1768 Monge became professor of mathematics and
1 professor of physics, at Mezières, where he
d Madame Horbon, a young widow whom he had
sly defended in a very puffed memoir against an
ded charge, in 1780 he was appointed to a chair
mathematics at the Lycæum in Paris (held by him together
is appointment at Mezières), and was received a
er of the Academy, his intimate friendship with
llet began at this time. In 1783, quarrying Mezières
, on the death of Bezout, appointed examiner of
candidates. Although pressed by the minister to
e for them a complete course of mathematics he
d to do so, on the ground that it would deprive
e Bezout of her only income, arising from the sale
works of her late husband. He wrote, however
, his *Traité élémentaire de la Statique*.

nge contributed (1770–1790) to the *Memoirs* of the
my of Turin, the *Mémoires des Savants Etrangers* of
ademy of Paris, the *Mémoires* of the same Academy,
e *Annales de Chimie*, various mathematical and
al papers. Among these may be noticed the memoir
la théorie des déblais et des remblais (*Mem. de
de Paris*, 1781), which, while giving a remarkably
investigation in regard to the problem of earth
eferred to in the title, established in connexion with
capital discovery of the curves of curvature of a
. Euler, in his paper on curvature in the Berlin
rs for 1760, had considered, not the normals of the
, but the normals of the plane sections through a
lar normal, so that the question of the intersection
essive normals of the surface had never presented
o him. Monge's memoir just referred to gives the
y differential equation of the curves of curvature,
tablishes the general theory in a very satisfactory
r; but the application to the interesting particular
the ellipsoid was first made by him in a later paper
5. A memoir in the volume for 1785 relates to
duction of water by the combustion of hydrogen,
onge's results in this matter had been anticipated
tts and Cavendish.

792, on the creation by the Legislative Assembly
executive council, Monge accepted the office of
r of the marine, but retained it only until April
When the Committee of Public Safety made an
to the savants to assist in producing the *material*
ed for the defence of the republic, he applied himself
nolly to these operations, and distinguished himself
indefatigable activity therein; he wrote at this
is *Description de l'art de fabriquer les canons*, and
is aux ouvriers en fer sur la fabrication de l'acier.
ok a very active part in the measures for the
shment of the Normal School (which existed only
during the first four months of the year 1795)
the School for Public Works, afterwards the Polytechnic
School, and was at each of them professor for the
geometry, his method in that science were taken
lished in the form in which the shorthand writers
down his lectures given at the Normal School in 1795
again in 1798–99. In 1796 Monge was sent next
with Berthollet and some artists to receive the pictures
and statues levied from several Italian towns, and
there the acquaintance of General Bonaparte. Two
afterwards he was sent to Rome on a political mission
which terminated in the exile, becoming under Masséna
the headstrong Roman republic, and he thence joined
expedition to Egypt, taking part with his friend Berthollet
in the cross-operations of the war in the
labours of the Institute (in the interests of Science and
the Arts accompanied Bonaparte to Suez, and returned
him in 1799 to France. Monge was appointed president
of the Egyptian commission, and became associated
with the Institute school. His later mathematical
papers were published (1795–1810) in the *Journal de
l'École Polytechnique*. On the
tion of the Senate he was appointed a member
honour with an ample provision, and the title of
Péluse, but on the fall of Napoleon he was deprived
of his honours and exiled from the court
him of the pension granted by Louis. He died at Paris
the 28th of July 1818.

[illegible] Monge [illegible] to the heights
[illegible] between 21° 22′ and
N. lat., and 5° 10′ and 8° 30′ W. long., bounded
the N. by Bambuk, the E. by the Falémé river,
part of the S. by the Scarcies and Hia rivers,
on the W. by Cape Verga, Farim, and Bathomarah, with
an area of 39,200 square miles. The Gambia divides the
into two portions. The northern, intersected by the
Gambia and Upper Niger two important tributaries,
Gambia is always liable to inundation during the
season, and is so much that, except and the country,
to a large population. A considerable area
the banks and the basin of the great river is devoted
pasturage. Farmers cultivate on the
and the [illegible] butter made from the
forms an important article of export to Calcutta.
south of the Gambia the country is dry, much
and broken up by mountainous ranges. The
of part consists of varying proportion
of hills intersect the part of the district and
extreme south form a real portion of the
jungle, but of no great height. Irrigation is
throughout the section. Lying on the south of the Gambia

In 1872 the population of Monge [illegible] was 429,986
85,074 female 215,912. Hindus 1,015,540, Mohamm

82,269 the remainder consisting mainly of aboriginal tribes and
all race professing some form of faith. There are also a few
Buddhists and Christians. Seven towns contained upwards of
5000 inhabitants in 1872: Monghyr 33,698, Shaikhpura 11,536,
Jamalpur [illegible] 10,10[illegible], Surajgarha 7956, Barbighat
3623, and Lakhisarai 3499. Sixteen-twentieths of the area under
cultivation at the time the revenue survey was made, when it was
returned at 1,[illegible]05 acres, are known. However, that cultiva-
tion has since extended much further. The land is held principally
under the tenure known as *bhaoli*, by which the tenant pays
a certain share of the produce according to the custom of the
country. Rice is the staple crop, and most popular with the
natives. Mohuas, a species of forest, mango trees, sugar-cane,
vegetables, and most kinds of cereals and pulses are produced in
abundance, but no notice of them is called for in this article.
Coal is found in the Monghyr district, with good iron ore
in many places. The most important mineral product, however, is saltpetre, which is manufactured by means of large
vats, and under European supervision. The total area
under indigo cultivation is about 20,000 acres, with an average
out-turn of 2000 cwt. of dye. Mulberry trees are grown,
and silkworms are reared on a considerable scale. Opium is
the principal export, next to which come rice, sugar, and pulses.
Wheat, barley, maize, gram, and pulses are grown, and tobacco,
and the chief imports consist of European piece goods, salt, and
sugar. The value of the former in 1876-77 was £[illegible]50,000, and of the
latter £314,000. Education is making fair progress, and in 1[illegible]
there were 229 Government and aided schools attended by 6[illegible]
pupils. The climate is [illegible]. The temperature is high
in the hot weather, reaching 107° Fahr. in May; but the
weather is cool and pleasant. The average annual rainfall
is [illegible]. Malarial fever is comparatively uncommon, but epi-
demics of cholera occur frequently.

Monghyr was one of the principal centres of the Mohammedan administration in Bengal. In the early years of British rule Monghyr formed a part of Bhagalpur, and was not created a separate district until 1832.

Monghyr, chief town and administrative headquarters of the above district, is situated on the south bank of the Ganges (25° 23′ N. lat., 86° 30′ E. long.). The population in 1872 was 69,698, viz., Hindu, 44,900, Mohammedan, 14,346, Buddhist, 33, Christians, 305, "others,"

In 1196 Monghyr, a fortress of great natural strength, appears to have been taken by Muhammad Bakhtyar Khalji, the first Muhammedan conqueror of Bengal. Henceforth it is often mentioned in Muhammedan history. Being a place of military importance, it was frequently chosen as the seat of the local government. In 1590, when Akbar established his supremacy over the Afghan chief of Bengal, Monghyr was long the headquarters of his general Todar Mall, and it also figures prominently during the revolt of Sultan Shuja against his brother, Aurungzeb. In more modern times Nawab Mir Kasim, in his war with the English, selected it as his residence, and the centre of his military preparations. Some of Monghyr's ammunition is said to date from the arsenal he established. The town is now purely a civil station, and one of the most picturesque in Bengal.

MONGOLS

THE early history of the Mongol, like that of all central Asian tribes, is extremely obscure. Even the meaning of the name "Mongol" is a disputed point, though in general consent is now given to Schott's etymology of the word from "mong," meaning brave. From the earliest and very scanty notices we have of the Mongol in the history of the Tang dynasty of China (A.D. 619-907) and in works of later times, it appears that their original camping ground was along the course of the Kerulon, Upper Nonni, and Argun rivers. But in the absence of all historical particulars of their origin legend, real or mythical, has been busy with their early years. The Mongol historian Sanang Ssetsen gives currency to the myth that they proceed from a blue wolf, and the oldest story on record is that their ancestor Budantsar was miraculously conceived of a Mongol widow. By craft and violence Budantsar gained the chieftainship over a tribe living in the neighbourhood of his mother's tent, and that left a heritage to his race. Varying fortunes attended the descendants of Budantsar, but on the whole their power gradually increased, until Yesukai, the father of Jenghiz Khan, who was eighth in descent from Budantsar, made his authority felt over a considerable area. How this dominion was extended under the rule of Jenghiz Khan has already been shown (see GENGHIZ KHAN), and when that great conqueror died he left to his son in the valley of Kelon in 1227 he left to his empire which stretched from the China Sea to the banks of the Dnieper.

Over the whole of the vast region Jenghiz Khan set his second son, Ogdai, or Ochotai, or Ogdai Khakan, or chief khan, while to the family of his deceased eldest son Juchi he assigned the country from Kavalik and Kharezm to the borders of Bulgar and Saksin, where on the boots of Mongol horse-hair felt [illegible] to Jagatai his eldest surviving son, the territory from the borders of the Uigur country to Bokhara; while Tuli, the youngest, received charge of the home country of the Mongols, the care of the imperial encampment and family, and of the archives of the state. The appointment of Ogdai as his successor, being contrary to the usual Mongol custom of primogeniture, gave rise to some bitterness of feeling among the followers of Jagatai. But the command of Jenghiz Khan subdued these murmurs, and Ogdai was finally led to the throne by his dispossessed brother amid the plaudits of assembled Mongols. The ceremony was complete. Ogdai making three solemn genuflexions to the sun by the prince taking an oath by which they swore so long as there remained of his posterity a morsel of which thrown upon the grass would prevent the cows from eating, or which put in the fat would prevent the dogs from taking it, they would not place on the throne any of any other branch. In accordance with Mongol custom Ogdai signalized his accession to the throne by distributing among his comrades present from his father's treasure, and to his father's spirit he sacrificed forty maidens and one hundred horses. Once fairly on the throne, he set himself vigorously to follow up the conquests won by his father. At the head of a large army he marched southward into China to complete the ruin of the Kin dynasty, which already had been so rudely shaken, while at the same time his lieutenants advanced into the province of Honan from the side of Siberia. Against the combined attack the Kin troops made a gallant stand, but the skill and courage of the Mongols bore down every opposition, and over a hecatomb of slaughtered foes they captured Kai fung Foo, the capital of the empire. From Kai fung Foo the emperor fled to Jo Foo, whither the Mongols quickly followed. After sustaining a siege for some weeks, and enduring all the horrors of starvation the garrison submitted to the Mongols, and at the same time the emperor committed suicide by fire. Thus fell in 1234 the Kin or "Golden" dynasty which had ruled over the northern portion of China more than a century.

But though Ogdai's first care was to extend his empire in the rich and fertile provinces of China, he was forgetful of the obligation under which Jenghiz Khan's conquests in western Asia had laid him to maintain supremacy over the kingdom of Kharezm. This was more incumbent on him since Jelál al dín, who had been driven by Jenghiz into India, had returned, reinforced by the support of the sultan of Delhi, whose daughter he had married, and, having reconquered his hereditary dominions had advanced westward as far as Tiflis and Khelat. Furthermore to dispossess the young sultan, Ogdai sent an army of 300,000 men into Kharezm. With such amazing celerity did this army march in pursuit of its foe that

ced Mongol guards reached Amid (Diarbekr), whither l-dín had retreated, before that unfortunate sovereign y idea of their approach. Accompanied by a few ers, Jelal al-dín fled to the Kurdish mountains, where basely murdered by a peasant. The primary object Mongol invasion was thus accomplished, but, with stinct of their race, they made this conquest but a ng stone to another, and without a moment's delay l on still farther westward. Unchecked and almost osed, they overran the districts of Diarbekr, Meso a, Erbil, and Khelat, and then advanced upon jan. So great was the terror with which the arrions inspired the people of the province they d that single Mongols are said to have slain the tants of entire villages without a hand having been against them. In the following year (1230) they d Georgia and Great Armenia, committing frightful es, sparing neither man nor woman, young nor old, he exception of those whom they saved to minister ir wants or passions. Tiflis was among the cities d by assault, and Kars was surrendered at their ch in the vain hope that submission would earn cy from the victors. Meanwhile, in 1235, Ogdai troops were as numerous as their chief for conquest voured, despatched three armies in as many direc One was directed against Corea, one against the dynasty, which ruled over the provinces of China of the Yang-tse-Keang, and the third was sent west into eastern Europe. This last force was commanded u, the son of Juchi, Ogdai's deceased eldest brother, ook with him the celebrated Subutai Bahadur as his dviser. Bulgar, the capital city of the Bulgars, fell the force under Subutai, while Batu pushed on over lga. With irresistible vigour and a terrifying speed ongols made their way through the forests of Penza mboff, and appeared before the "beautiful city" of . For five days they discharged a deadly storm t from their balistæ, and, having made a breach in tences, carried the city by assault on the 21st of ber 1237. "The prince, with his mother, wife, he boyars, and the inhabitants, without regard to sex, were slaughtered with the axe in cruelty of l revenge; some were impaled, one shot at with for sport, others were flayed or had nails or plates d driven under their nails. Priests were roasted and nuns and maidens ravished in the churches their relatives. 'No eye remained open to weep e dead.'" Moscow, at this time a place of little ance, next fell into the hands of the invaders, who dvanced against Vladimir. After having held out veral days against the Mongol attacks, the city at succumbed, and the horrors of Riazan were repeated. mperial family, with a vast crowd of fugitives, sought in the cathedral, only to perish by the sword of the rors or by the flames which reduced it to ashes. It le, a more dire fate overtook the inhabitants of sk, near Kaluga, where, in revenge for a partial inflicted on a Mongol force, the followers of Batu so terrible a "carnival of death" that the city was ed by its captors Mobalig, "the city of woe." With le of victory thus strong in their favour the Mongol ed against Kieff, "the mother of cities," and carried assault. The inevitable massacre followed, and the as razed to the ground. While the scene of blood was at its height a catastrophe occurred which at ther time would have been considered of supreme . Under the weight of a vast crowd of fugitives t roof of the metropolitan church fell in, burying ung and old, in a vast hecatomb.

torious and always advancing, the Mongols, having desolated this portion of Russia, moved on in two divisions, one under Batu into Hungary, and the other under and Kaidu into Poland. Without a check, Batu marched to the neighbourhood of Pesth, where the whole force of the kingdom was arrayed to resist him. The Hungarian army was posted on the wide heath of Mohi, which bounded by "the vine-clad hills of Tokay," the mountains of Lommit, and the woods of Diosgyor. To an army hemmed in on all sides defeat meant ruin, and instantly recognized the direction in which the enemies had placed themselves. To add to his chances of success he determined to deliver his attack by night, while the careless Hungarians were sleeping before battle. Dismounting and leaving their tethered horses, they fell on all directions, followed by their men on foot. Two archbishops, three bishops, and many of nobility were among the dead, and the road for two leagues from the field of battle were strewn with The king, Bela IV., was saved by the fleetness of his horse, though closely pursued by a body of Mongols, followed at no great distance by the rest of the Mongol army, burning and destroying everything in their way. While Batu captured Pesth and on Christmas Day having crossed the Danube on the ice, Gran, Raab, and Wissegrad fell into the hands of the Mongols. At their approach the inhabitants of Cracow deserted their city, after having given it over to the flames. Disappointed at the loss of their expected spoil the Mongol advanced to Wahlstatt in the neighbourhood of Liegnitz, where Polish army under Duke Henry II. of Silesia awaited their onslaught. With savage impetuosity the troops of rushed to the attack, and completely defeated the Polish. No quarter was given. The massacre was total and Duke Henry himself was among the slain. It was a Mongol habit to cut off an ear from each of their slaughtered foes, and on this occasion it is said they filled nine sacks with the ghastly trophies. Following the example of the inhabitants of Cracow, those of Liegnitz left but the blackened walls of what had been the town a prey to the Mongols, who without delay pushed on into Moravia, and ravaged the country of Troppau. While leaving waste the country in the neighbourhood of their tower they received the announcement of the death of Ogdai, and at the same time a summons for Batu to return forthwith into Mongolia.

While his generals had been thus carrying havoc in all directions Ogdai had been giving himself up to ignoble ease and licentiousness. Like many Mongols he was much given to drink, and it was to a disease produced by this cause that he finally succumbed on the 11th December 1241. He was succeeded by his son Kuyuk, of whose character little is known, but it is noticeable that his two ministers to whom the entire control of affairs were entrusted were Christians, as also was his mother, and that a Christian chapel stood before his tent. This leaning toward Christianity, however, bore no peaceful fruit. On the contrary we find Kuyuk preparing to advance against the Sultan of Rum (Asia Minor), and despatching an expedition to Syria, by which that country was made tributary to the Great Mongol empire, of a threatened attack upon Corea and of another attack on the southern provinces of China. On the death of Kuyuk dissensions which had been for a long time smouldering between the house of Ogdai and Jagatai broke out into open war, and the most undisputed regions of Kaidu and Chapar, sons of Ogdai, the kingship passed away from the house of Ogdai for ever.

On the 1st of July 1251 Mangu, the eldest son of Tule, and nephew to Ogdai, was elected Great Khan.

perfect impartiality, Mangu allowed the light of his countenance to fall upon the Christians, Mohammedans, and Buddhists alike, although Shamanism was recognized as the State religion. Two years after his accession to the throne he was visited by Rubruquis and other Christian monks, who were hospitably received. The description given by Rubruquis of the Khakan's palace at Karakorum is very brief. How vast was the interval which separated him from the nomad, together with the life of his forefathers! It was surrounded by lofty walls. . . . Its architect, who had three doors. . . . The central hall was like a church and contained a throne and two tables, separated by a curtain. . . . Here the Great Khan sat on the first day of the year. In front of the throne was placed a silver tun, having at its four corners four golden lions, from whose mouths there poured mare's milk, or else wine, liquorice, honey-drink, and rice-wine. At the top of the tun there was a silver vessel provided with a trumpet, when the butler-in-chief wanted to replenish it he blew through the trumpet, whereupon the cup-bearers filled their flagons.' On his accession to the throne Mangu had to deal with a conspiracy which had been formed against him by his brother Kublai and his uncle Hulagu, who were held to be the cause of the disorder. Marching by Samarkand and Bokhara, Hulagu crossed the Oxus and advanced by way of Balkh into the province of Kohistan. The terror of the Mongol name induced Rukn al-din, the chief of the Assassins, to deprecate the wrath of Hulagu by offers of submission, and he was thus actually able to purchase a temporary immunity from invasion by the surrender of the principal fortresses in Kohistan. But when the country had thus been left at the mercy of the invaders, their instinct for the old system of 'Stone and Arrow' suspended their battle-axes, and, spurning neither man, woman, nor child, they exterminated the savage people. Hulagu then marched across the snowy table-land in the direction of Baghdad. On arriving before the city he demanded its surrender. This being refused, he encamped the walls on the east side. The Mongol forces amounted to 150,000 men, and the caliph was induced to believe that, if he would only open the gates to his enemy, Hulagu would be content with a large ransom and would withdraw. Instead of doing so, however, the Mongols entered the city, and, following their usual tactics, sacked the city. For forty days it was given up to pillage, fire, and the sword, and the number of killed was said to have reached the enormous total of 800,000. For the moment the caliph's life was spared, and he was allowed to carry away 100 wives out of 700 who had formed his harem, on being thrown upon whom 'neither the sun nor moon had shone.' But his fate soon exceeded his wildest imaginings. According to the current rumours of his death, one account was that he was sewn up in a sack and trodden to death by horses, another that he was starved to death. To the Moslem world his loss was a religious catastrophe, as it left Islam without a spiritual head. While at Baghdad Hulagu granted his astronomer, Nasir al-din, permission to build a great observatory. The town of Maragha was the site selected under the superintendence of Nasir al-din and nine assistant astronomers who were associated with him, a handsome observatory was built, and furnished with 'armillary spheres and astrolabes and with a beautifully executed terrestrial globe showing the five climates.' One terrible result of the Mongol invasion was a fearful famine which desolated the provinces of Dar Arabi, Mesopotamia, Syria and Rum. For, though the inhabitants starved, the Mongols had strength and energy left to continue their onward march into Syria. Aleppo was stormed and sacked, Damascus surrendered, and Hulagu was meditating the capture of Jerusalem with the object of restoring it to the Christians when he received the news of Mangu's death, and at once set out on his return to Mongolia, leaving Kitubuka in command of the Mongol forces in Syria. As a reward for his services, Hulagu received the investiture of his conquests, and established the empire of the Ilkhans.

While Hulagu was prosecuting these conquests in western Asia, Mangu and his next brother Kublai were pursuing a like course in southern China. Southward they had advanced into Tong king, and westward they carried their arms over the frontier into Tibet. But in one respect there was a vast difference between the two campaigns. Under the war-command of Kublai all indiscriminate massacres were forbidden, and probably for the first time in Mongol history the inhabitants and garrisons of captured towns were treated with humanity. While carrying on the war in the province of Szechuen Mangu was seized with a fatal form of dysentery, which proved fatal after a few days' illness. His body was carried into Mongolia on the backs of two camels, and, in pursuance of the custom of slaughtering every one encountered on the way, 20,000 persons were, according to Marco Polo, put to the sword.

At the Kuriltai, or assembly of notables, which was held at Shang-tu after the death of Mangu his brother Khubilai (see KUBLAI KHAN) was elected Khakan. His thirty-five years' reign on the Mongol throne, and his death in 1294, in his seventy-ninth year, he was succeeded by his son Timur Khan, or, as he was otherwise called, Oljeitu Khan. The reign of the sovereign was chiefly remarkable for the healing of the dissension which had for thirty years separated the families of Ogdai and Jagatai from that of the ruling Khakan. Oljeitu was succeeded by his nephew Khaishan. In accordance with the Mongol ceremony, on the election being announced four of the princes of the blood raised the new khakan aloft on a piece of white felt, two others supported him, while a fourth offered him the cup. 'Meanwhile, while Shaishan entered upon his prosperity and adopted the title of Kuluk Khan, carts full of gold pieces and of silver were brought out and distributed. So many pieces were spread on the ground that it resembled the sea-shore. The feast lasted a week, during each day of which 40,000 sheep were consumed. Libations of milk from 700 white cows and 7000 ewes were sprinkled on the ground.' With that tolerance which so markedly characterized the Mongols at this period, Kuluk worshipped indiscriminately at the temples of the Chinese Shamans and before the Buddhist shrines, while at the same time he lent a favourable countenance to John of Montecorvino, who, during the whole of his reign, was archbishop of Peking. Unfortunately the archbishop was not so tolerant as the Khakan, and carried on as fierce a dispute with the Nestorian Christians of his day as that which divided Dominicans and Jesuits in China three centuries later. After a short reign, and at the early age of thirty one, Kuluk was gathered to his fathers in February 1311. His nephew and successor, Buyantu, was a man of considerable ability and substantially patronized Chinese literature. Among other benefits which he conferred on letters, he restored the celebrated inscription-bearing "stone drums," which are commonly said to be of the Chow period (B.C. 255) from the decay and ruin to which they were left by the last emperor of the Kin dynasty, and placed them in the gateway of the temple of Confucius at Peking, where they now stand. After a reign of nine years Buyantu was succeeded by his son Gegen, who perished in 1323 by the knife of an assassin, the first occasion on which a reigning descendant of Jenghiz Khan thus met his fate. Yesun Timur, who was the next sovereign, devoted himself mainly to the administration of his empire. He divided China, which until that time had been apportioned into twelve provinces, into eighteen provinces, and rearranged

system of state granaries, which had fallen into disorder. His court was visited by Friar Odoric, who gives a minute description of the palace and its inhabitants. Speaking of the palace this writer says:

"Its basement was raised about two paces from the ground and within there were twenty four columns of gold, and all the walls were hung with skins of red leather, and so be it in the world. In the midst of the palace was a great jar more than two paces in height, made of a certain precious stone called nefrin (jade); its price exceeded the value of four large towns. Into this vessel drink was conducted by certain conduits from the court of the palace, and beside it were many golden cups from which those drank who feasted. When the Khakan sat to drink the queen was on his left hand, and a step lower sat the other of his wives, while at the bottom of the steps stood the other ladies of his family. All those who were married wore upon their head the skin of a marten as it were a cubit and a half in length, and at the top of the foot there were certain crane's feathers, the whole foot being set with great pearls, so that if there were in the whole world any fine and large pearls they were to be found on the decoration of those ladies."

The following years were years of great natural and political convulsions. Devastating floods swept over China, carrying death and ruin to thousands of homes; earthquakes made desolate whole districts, and in more than one part of the empire the banners of revolt were unfurled. The Khakans who now successively occupied the throne, instead of striving to stem the tide of discontent and disorder, gave themselves up to every kind of debauchery. As a natural consequence, the conduct of affairs fell entirely into the hands of their ministers, who but too often neglected the interests of their sovereigns. A comet which appeared in the reign of Toghon Timur Khan, and which was believed to be the precursor of fresh disasters to the reigning house, justified the prediction by being almost immediately followed by an earthquake, which overthrew the temple of the Imperial Ancestors, from the altars of which, as if to complete the misfortune, the silver tablets of the emperors were in the consequent confusion stolen. It was not long before the popular discontent found vent. In order to prevent the recurrence of the periodical inundations caused by the overflow of the Yellow river, the emperor ordered a levy of 70,000 men to excavate a new channel for the dangerous stream, and imposed a heavy tax to meet the necessary expenses. The oppressive edicts overtaxed the patience of the people, and they broke into open rebellion. Under various leaders the rebels captured a number of cities in the provinces of Kwangnan and Honan, and took possession of Hang-chow, the capital of the Sung emperors. At the same time pirates ravaged the coasts and swept the imperial vessels off the sea. While these combined disorders were disturbing the country, the emperor, under the guidance of Tibetan Lamas, was being initiated into the carnal enjoyments peculiar to the warmer climates of Asia.

In 1355 a Buddhist priest named Choo Yuen chang became so impressed with the misery of his countrymen that he threw off his vestments and enrolled himself in the rebel army. His military genius soon raised him to the position of a leader, and with extraordinary success he overcame with his rude levies the trained legions of the Mongol emperor. While unable to defeat or check the rebels in the central provinces Toghon Timur was also called upon to face a rebellion in Corea. Nor were his arms more fortunate in the north than in the south. An army which was sent to suppress the revolt was cut to pieces almost to a man. These events made a dream which the emperor dreamt about this time of easy interpretation. He saw in his sleep "a wild boar with iron tusks rush into the city and wound the people, who were driven hither and thither without finding shelter. Meanwhile the sun and the moon rushed together and perished." "This dream," said the diviner, "is a prophecy that the khakan will lose his empire." The fulfilment followed closely on the prophecy. By a subterfuge, the rebels, after having gained possession of most of the central provinces of the empire, captured Peking. But Toghon Timur, in a hasty flight escaped from his enemies, and sought safety on the shores of the Dolonor in Mongolia. For a time the western provinces of China continued to hold out against the rebels, but with the flight of Toghon Timur the Mongol troops lost heart, and in 1368 the ex Buddhist priest ascended the throne as the first sovereign of the Ming or "Bright" dynasty under the title of Hung-woo.

Thus ended the sovereignty of the house of Jenghiz Khan in China; nor need we look far to find the cause of its fall. Brave and hardy the Mongols have always shown themselves to be; but the capacity for consolidating the fruits of victory, for establishing a settled form of government, and for securing the allegiance of the conquered people, have invariably been wanting in them. In time their prowess and the exceptional ability of some of the first emperors of their line held the people of China in a bondage which was only outwardly peaceful; but when the hands which held the rein lost their nerve and power, and the troops, enervated by the softer climate of China, lost much of their hardihood, the long pent hatred of a foreign yoke broke out, and with gathered strength drove the invaders back to their Mongolian pasture-ground.

Not content with having recovered China, the emperor Hung-woo sent an army of 100,000 men into Mongolia in pursuit of the forces which yet remained to the Khakan. Even on their own ground the disheartened Mongols failed in their resistance to the Chinese, and at all points suffered disasters. Meanwhile Toghon Timur, who did not long survive his defeat, was succeeded in the Khakanate by Bilik Tu Khan who ascended in 1379, followed by Uskhai Khan. During the reign of this prince the Chinese again invaded Mongolia, and inflicted a crushing defeat on the Khan's forces in the neighbourhood of Lake Buyur. Beside the latter 2,000 officers and 77,000 soldiers are said to have been taken prisoners, with immense booty to have been secured. The defeat was the final ruin of the eastern branch of the Mongols, who from this time surrendered the supremacy to the western division of the tribe. At last the Keraits of Toregod, a tribe in the early days before Jenghiz Khan rose to power, exercised lordship over the eastern Mongols, but from these before long the supremacy passed to the Onjad who for fifty years treated them as vassals. Without finding their objection, however, the Keraits preserved the imperial line and Khakan after Khakan assumed the nominal sovereignty of the tribe while the real power rested with the descendants of Toghon, the Onjad chief who had originally attached them to his sceptre. Gradually, however, the Mongol tribes broke away from all controlling centres, and established separate and petty chiefs over the whole eastern Mongolia. The discredit of having finally dissolved the tribes originally attached to Jenghiz Khan's court belongs, in reference to his immediate successors, to have been enacted the Mongolian proverb "A second khakan disturbs the state, and a rat-bitten elephant overthrows his keeper."

At this time the Mongols, though scattered and isolated bodies, had recovered somewhat from the effects of the disaster which they suffered at the hand of the Ming sovereign of China. When first driven northwards they betook themselves to the banks of the Kerulon, whence they had originally started on their victorious career. But gradually as the Chinese power became weaker among the frontier tribes, they again pushed southwards

this time had established colonies in the Ordus, within the northern bend of the Yellow river ongol royal family and their immediate surroundings of the Chakhar country to the north-west of the territories, where they became eventually subjugated Manchus on the overthrow of the Mongol dynasty to the present rulers of China. Probably out of reverence for the royal descent of their chief, the emperors have invariably placed these Mongols a privileged position, and have incorporated the eight or military divisions of the Chakhars as one of the eight banners of the imperial Manchu army. The Mongol who submitted to the Manchus were into 24 banners, 19 representing all those on the east of the desert, and 86 the Khalkhas, whose stretched along the north of the desert from the neighbourhood of Barkul on the west to the Dalai the north-east. From and before this period the of the eastern Mongols has been that of all the tribes of central Asia, about which nothing can be certainly said than that that which appears most likely to happen, and that that which naturally be expected rarely occurs. Each tribe, fortune varied, either rose to power or sank into eance. At times the old vigour and strength and nerved the arm of Jenghiz Khan roused to the tribe, and we read of successful expeditions made by the Ordu Mongols into Tibet, and even of into China. The relations with Tibet thus ated brought about a rapid spread of Buddhism the Mongolians, and in the beginning of the 17th the honour of having a Dalai Lama born among vouchsafed to them. In 1652 Tsoba, one of the Ba-hukur Jonun Khan, went on a pilgrimage to ai Lama, and brought back with him a copy of the to be translated into Mongolian, as the Kanjur eady been. But though the power of the Ordu was still unsubdued, their mode of living was and rugged as the deposits and rocky hill which their territory. Their flocks and herds, on which entirely dependent for food and clothing, are not , and, like their masters, are neither well fed nor oured. But though living in the miserable condi princes yet keep up a certain amount of barbaric and the people have at least the reputation of being

Several of the tribes who had originally migrated those who finally settled in the Ordu territory, under ity to be so inhospitable, moved farther eastward per pasture. Among these were the Tumeds, one chiefs, Altan Khan, a famous in later Mongol his the power he acquired. For many years during the which he carried on a not altogether unsuccessful in China, and finally, when peace was made (1571), were fain to create him a prince of the empire conferred a golden seal of authority upon him. In these wars successful as in China but, as has observed in history, the physical conquerors became mental subjects of the conquered. Lamaism has had a great attraction in the eyes of the Mongols, on both the supernaturality of some Lamaist prisoners Altan brought back in his train, the religion spread time rapidly among the Tumeds. Altan himself ed the faith and received at his court the Bogda Gyamtso Khutukta, on whom he lavished every f honour. One immediate effect of the introduction dhism among the Tumeds was to put an end to the s which were commonly made at the grave of their ns. In 1584 Altan died, and was succeeded by his ge Dayancng Tumur. The rich territory occupied Tumed, together with the increased intercourse with China which sprang up after the wars of Altan, began effect a change in the manner of life of the people. degrees the pastoral habits of the inhabitants became agricultural, and at the present day, as in Manchuria, Chi immigrants have so stamped their mark on the fields market, on the towns and villages, that the country become to all intents and purposes part of China prop

Passing now from the inner division of the Mongols to say, the Chakhar and the 19 banners who live in southern and eastern portions of the desert we come to outer division, which is divided into 86 banners, occupies the territory to the north of the desert. Of t the chief are the Khalkha, who are divided into the W ern and Eastern Khalkhas. These people form the lin communication between Europe and eastern Asia. E m the 17th century the Russians sent an embassy to court of the Golden Khan with the object of persuading Mongol khan to acknowledge allegiance to the czar he did without much hesitation or inquiry, and he then despatched envoys to Moscow on the return of Russian embassy. But the allegiance thus lightly acknowledged was lightly thrown off, and in a quarrel which b out between the Khirghiz and the Russians the Khalk took the side of the former. The breach, however, soon healed over, and we find the Golden Khan send an envoy again to Moscow asking on behalf of his ma for presents of jewels, arms, a telescope, a clock, and monk who had been to Jerusalem that he might teach Khalkhas how the Christians prayed. Their submis to Russia on the north did not save them, however, t the Chinese attacks on the south. In central Asia the recent history of Russia in that part of the w shows, the depredations of a tribe on the property of ner tribesmen supply a ready cause of quarrel at any mom and the Chinese had no difficulty, therefore, in justify an invasion of the Khalkha territory. At that time present Manchu dynasty ruled in China, and to the t reigning sovereign the Khalkhas gave in their submiss For some time the Chinese yoke sat lightly on t conscience, but difficulties having arisen with the mind, they were ready enough to claim the protectio China. To cement the alliance the emperor Kang invited all the Khalkha chiefs to meet him at the p of Dolonor. This ceremony brought the separate his of the Khalkhas to a close, since from that time they h been enrolled in the Chinese empire.

Another important branch of the great Mongolian fa is the tribe of the Koshod or Eleuths. These claim their chieftains have maintained unbroken the direct des from Khoshar, a brother of Jenghiz Khan. Their h is in the neighbourhood of the Koko-nor, and in the cou to the north of the narrow strip of the Kansuh prov which separates that district from Mongolia proper. pasture in the territories thus indicated is rich and abu ant, and the Eleuths have therefore had fewer temptat to wander than most of their cognate tribes. Being t tationary and within a short distance of the Chinese f tier, they early fell under the dominion of that empire, in the year 1725 were incorporated into 29 imperial ban

During the Kin dynasty of China the Keraits, as been pointed out, were for a time supreme in Mongo and it was during that period that one of the ear recognized sovereigns, Merghus Buyuruk Khan, sat on throne. In an engagement with a neighbouring T tribe their Khan was captured and sent as a prop tory present to the Kin emperor, who put him to d by nailing him on a wooden ass. On the treache Tatar chief the widow determined to avenge herself, chose the occasion of a feast as a fitting opportun With well-disguised friendship she sent him a presen

ten oxen, a hundred sheep, and a hundred sacks of kumiss. These last, however, instead of being filled with skins of the liquor which Mongolians love so well, contained armed men, who, when the Tatar was feasted, rushed from their concealment and killed him. A grandson of Merghus was the celebrated Wang Khan, who was sometimes the ally and sometimes the enemy of Jenghiz Khan, and has also been identified as the Prester John of early Western writers. In war he was almost invariably unfortunate, and it was with no great difficulty, therefore, that his brother Ki Wang detached the greater part of the Kerait tribes from his banner, and

The Torgod.

founded the Torgod chieftainship, named probably from the country where they settled themselves. The mist peculiar to the dwellers in the Mongolian desert disturbed the Torgod as much as their neighbours. Their history for several centuries consists of nothing but a succession of wars with the tribes on either side of them, and it was not until 1672, when Ayuka Khan opened relations with the Russians, that the country obtained an even temporarily settled existence. Its position, indeed, at this time made it necessary that Ayuka should ally himself either with the Russians or with his southern neighbours the Turks, though at the same time it was obvious that his alliance with the one would bring him into collision with the other. His northern neighbours, the Cossacks of the Yaik and the Bashkirs, both subject to Russia, had the not uncommon propensity for invading his borders and harassing his subjects. This gave rise to complaints of the czar's government and a disposition to open friendly relations with the Krim khan. A rupture with Russia followed, and Ayuka carried his arms as far as Kasan, burning and laying waste the villages and towns on his route and carrying off prisoners and spoils. Satisfied with this vengeance, he advanced no farther, but made a peace with the Russians, which was confirmed in 1722 at an audience which Peter the Great gave him at Astrakhan. On Ayuka's death, shortly after this event, he was succeeded by his son Cheren Donduk, who received from the Dalai Lama a patent to the throne. But this spiritual support availed him little against the plots of his nephew Donduk Ombo, who so completely gained the suffrages of the people that Cheren Donduk fled before him to St Petersburg, where he died, leaving his nephew in possession. With consummate impartiality the Russians, when they found that Donduk Ombo had not only seized the throne but was governing the country with vigour and wisdom, formally invested him with the khanate. At his death he was succeeded by Donduk Taishi, who, we are told, went to Moscow to attend the coronation of the empress Elizabeth, and to swear fealty to the Russians. After a short reign he died, and his throne was occupied by his son Ubasha. The position of the Torgod at this time, hemmed in as they were between the Russians and Turks, was rapidly becoming unbearable, and the question of migrating "bag and baggage" was very generally mooted. In the war between his two powerful neighbours in 1769 and 1770, Ubasha gave valuable assistance to the Russians. His troops took part in the siege of Otchakoff, and gained a decided victory on the Kalans. Flushed with these successes, he was in no mood to listen patiently to the taunts of the governor of Astrakhan, who likened him to a "bear fastened to a chain," and he made up his mind to break away once and for all from a tutelage which was as galling as it was oppressive. He determined, therefore, to migrate eastward with his people, and on the 5th of January 1771 he began his march with 70,000 families. In vain the Russians attempted to recall the fugitives, who, in spite of infinite hardships, after a journey of eight months reached the province of Ili, where they were welcomed by the Chinese authorities. Food for a year's consumption was supplied to each family; and land, money, and cattle were freely distributed. [illegible] many lost their lives on the toilsome march it is impossible to say, but it is believed that 300,000 persons survived to receive the hospitality of the Chinese. The migration is interesting as illustrating the many displacements of tribes and peoples which have taken place on the continent of Asia at different periods of history. Some another migration occurred between four and five thousand years ago, when the Chinese crossed from western Asia into their present empire, such, again, was the movement which carried the Osmanli Turks from north-eastern Asia into Asia Minor, and eventually across the Bosphorus. By this desperate venture the Torgod escaped the re-imposition of the Russians, but they fell into the hands of other masters, who, if [illegible] equally determined to be supreme. The Chinese, flattered by the compliment implied by the transference of allegiance, settled them on lands in the province of Ili in the neighbourhood of the Altai Mountains, and to the west of the desert of Gobi. But the price they were made to pay for this liberality was adoption in the Chinese empire. Like the other Chinese-dubbed Mongols, the Torgod were divided into banners, and from that time forth they lost their individuality.

Among the Mongol chiefs who rose to fame during the rule of the Ming dynasty of China was Toobon, the Altuk Khan, who taking advantage of the state of confusion which reigned among the tribes of Mongolia, established for himself an empire in north-western Asia. Death carried him off in 1414, and his throne devolved upon his son Yesden, who was no degenerate offspring. Being without individual foes in Mongolia for the same reason that Nurhaci had no enemies [illegible] at he had killed them all, he turned his arms against China, which throughout history has been the happy hunting ground of the northern tribes, and had the unexampled good fortune to take prisoner the Chinese emperor Chingtung. But victory did not always decide in his favour, and, after having shattered reverses at the hand of the Chinese, he decided to open negotiations for the restoration of his imperial prisoner. This, after a captivity of seven years, Chingtung re-entered his [illegible] not altogether to [illegible] subject. On the death of Yesden [illegible] the Kalmuks lost much of their [illegible] but retained enough in other parts to assume the Khanate by virtue of their [illegible] and by constant acts of pillage and [illegible] were greatly restored [illegible] the united combination [illegible] the throne of his brother Seng[illegible]. Having been partly [illegible] at Ehcta he was well received by Arigh-pehtse-hoad, taking advantage of a quarrel between the Black and White Mountaineers of Kashgar overran Little Bokhara and left a viceroy to rule over the province with his capital at Yarkand. At the same time he opened relations with China, and exchanged presents with the emperor. Having thus secured his power southern and [illegible] to be thought, he turned his arms against the Khalkhas, whose chief ground of offence was their attachment to the cause of his brother. But his [illegible] and action created alarm at Peking, and the emperor Kanghi determined to protect the Khalkhas against the enemy. Great preparations were made for the campaign. The emperor, in person commanding one of the two forces, marched into Mongolia. After enduring incredible hardships during the march through the desert of Gobi the imperial army encountered the Kalmuks at Chromoto. The engagement was fiercely contested, but ended in the complete victory of the Chinese, who pursued the Kalmuks [illegible] 10 miles, and completely dispersed their forces. Immediately

were slain, among whom was Galdan's wife, and
housands surrendered themselves to the victors
with his son, daughter, and a few followers, fled
d and escaped, and thus collapsed a power which
ained at one time to overshadow the whole of Cen
a. For a time Galdan still maintained a semblance
truce to his powerful enemy, and death overtook
he yet in the field against the Chinese. The news
Galdan's death was received with great rejoicings at Pekin
Kang-hi held a special service of thanksgiving to Heaven
his ancestors were honoured, and ordered that the body
the enemy, whose body had been burned, should be
ought to the capital and there scattered to the four
winds. The fear which had been thus exorcised was no idle
one. Galdan was a man to be feared. The conqueror
Kashgar, Ili, Turfan, Karashar, Hami, and
numerous other towns, might well be considered a
formidable foe, and Heaven a merciful deliverer in ridding
the world of the cruel and dangerous Buddhist.

Although Galdan was dead the Chinese did not enjoy
complete immunity from war at the hand of his suc
cessors, but they had to deal with Arabtan's son, Amursana, who
had the shadow of his brother's and predecessor's
ambition without any of the Russian alliance which had
enabled his power in other directions. Little Bokhara
was said to be rich in gold mines, and therefore be
coveted region in the eyes of the Russian Under
Peter the Great an expedition
had been despatched to force a passage into the desired
land. To oppose the invasion the Kalmuks assembled
in force, and after a protracted and undecided engagement
the Russians were glad to agree to retire down the Irtish
and give up all further advance.

Arabtan's son, Amursana, succeeded Amursana's own
account he received from the Chinese emperor Kien-
Lung the nomination of Khan of the Kalmuks and
Prince Sungaria. But, though to the ear these titles
sounded as high-sounding as those of his predecessors, in
reality the power they represented was curtailed by the
presence of Chinese commissioners, in whose hands rested
the real authority. The galling weight of this state of
affairs soon drove Amursana before long into revolt. He
killed all the Chinese garrisons stationed in Ili, killed the
Chinese, and advanced his own forces as far as Pakhum on
the Ili. To punish this revolt, Kien-lung sent a large
force to the rebellious province. As on the previous occa
sion the Chinese were everywhere victorious, and Amursana
fled to Siberia, where he died of smallpox after a short
stay. The Chinese demanded his body, but the Russians
refused to give it up, though they allowed the Chinese
commissioners to identify it. On the death of Amursana,
Kien-lung determined to abolish the Khanate, and in place
of one nominated four Khans to rule over the Sungarians, the
Derbet, the Khoshod, and the Dorbod. But the divided
rule proved quite as unmanageable as that which had
been wielded by the Khan and the new rulers soon at
tempted to throw off the yoke imposed upon them from
without. Again a Chinese army marched into Ili, and this
time a severe measure of repression was meted out to the
Sungarians and their sympathizers. A general massacre of the
people was ordered, and was faithfully carried out. The
country which had been as a fruitful field was utterly
depopulated, and the place of the Sungarians was taken by exiled
Mongols from China.

While China was thus absorbing the Mongols within
her borders, Russia was gathering within her borders those
with whom she came into contact. Among these were
the Buriats, who occupied a large territory on both sides of
Lake Baikal Lake. As usual in such cases, disputes arose
over disturbances on the frontier, and were ended by
the Buriats and the neighbouring Mongol tribes becom
ing one and all tributary to Russia.

Of the Mongol tribes who became entirely subject
Russia the principal are those of the Crimea, of Kasan, an
of Astrakhan; of these the Tatars of Kasan are the tru
representatives of the Golden Horde or Kipchaks, wh
originally formed the subjects of Batu and Orda. Bat
whose victorious campaign in Russia has already bee
sketched, was finally awarded as his fief the vast steppe
which stretch from the Carpathian Mountains to th
Bolkai Hills. Over these vast plains the Mongols followe
their flocks and herds, while the more settled among the
established themselves along the banks of the rivers whic
flow through that region. Batu himself fixed his head
quarters on the Volga, and there set up his Golden Tent fro
which the horde acquired the name of the Golden Horde.
In 1256 Batu died and was succeeded by his brother Bereke
Khan. During the reign of this sovereign the exaction
which were demanded from the Russian Christians by th
Mongols aroused the Christian world against the barbaria
conquerors, and at the command of Pope Alexander IV.
a general crusade was preached against them. But thou
the rage of the Christians was great, they lacked the
united energy which might have availed them against the
enemy; and, while they were yet breathing out denuncia
tions, a Tatar host, led by Nogai and Talabugha, appeared
in Poland. After a rapid and triumphant march, the in
vaders took and destroyed Cracow, and from thence ad
vanced as far as Sythomir in Oppeln, from which point the
eventually retired, carrying with them a crowd of Christia
slaves. From this time the Mongols became for a season a
important factor in European politics. They corresponde
and treated with the European sovereigns, and intermarrie
with royal families. Hulagu, the famous general, marrie
a daughter of Michael Palaeologus; Toktu Khan took as h
wife Maria, the daughter of Andronicus II.; and to Nog
Michael betrothed his daughter Irene. But Bereke's in
fluence extended beyond Europe into Egypt, from whic
country, as well as from Constantinople, he secured th
services of artisans to build him dwellings of a mo
substantial nature than that of his Golden Tent. But t
widely extending intercourse with foreign nations brough
in its train a consequence which tended fatally to unde
mine the existence of the horde. His conversion to Isla
introduced a strongly disintegrating influence into the co
munity, and with it were sown the seeds of its final d
ruption. Bereke was succeeded on his death in 1265 by h
grandson Mangu Timur, who throughout his reign was co
stantly engaged in hostilities with the Russians and h
other European neighbours. The Genoese alone found und
his patronage a means of advancing their possessions. F
some time these people had held large colonies in southe
Russia, and in the Crimea had divided the trade with th
Venetians. By the support of Mangu Timur these la
were driven out of the field, and the Genoese were left
the enjoyment of a monopoly of the commerce. The reig
of the khans who succeeded Mangu Timur were no le
stormy than his had been; but even in these troublo
times the influences which surrounded the Mongols l
them onward in the path of civilization. Toktu, the ne
khan but one to Mangu Timur, is the first Mongol rul
whom we hear of as having struck coins. Those issu
during his reign bear the mint marks of Sarai, New Sara
Bulgar, Ukek, Kharezm, Krim, Jullad, and Madjarui, an
vary in date from 1291 to 1312.

The adoption of Islam by the rulers of the Golden Hor
had as one result the drawing closer of the relations
the Mongols with Constantinople and Egypt. Embassi
passed between the three courts, and so important was th
alliance with the Mongols deemed by the sultan Nás

ruler of Egypt, that he sent to demand in marriage a princess of the house of Jenghiz Khan. At first his request was refused by the proud Mongols, but the present of a million gold dinars, besides a number of horses and suits of armour, changed the refusal into an acquiescence, and in October 1319 the princess landed at Alexandria in regal state. Her reception at Cairo was accompanied with feasting and rejoicing, and the members of her escort were sent back laden with presents. With that religious toleration common to his race, Uzbeg Khan, having married one princess to Nasir, gave another in marriage to George the prince of Moscow, whose cause he espoused in a quarrel existing between that prince and his uncle the grand prince Michael. Nominally the attitude of a judge in the dispute, Uzbeg Khan summoned Michael to appear before him, and, having given his decision against Khan ordered his execution. The sentence was carried out with aggravated cruelty in sight of his nephew and successor. From this time Uzbeg's sympathies turned toward Christianity. He protected the Russian churches within his frontiers, and put his seal to his new religious views by marrying a daughter of the Greek emperor, Andronicus III. He died in 1340, after a reign of twenty-eight years. His coins were struck at Sarai, Kharezm, Mokshi, Bulgar, Azak, and Krim, and are dated from 1313 to 1340. His son and successor, Tinibeg Khan, after a reign of only a few months was murdered by his brother Janibeg Khan, who usurped his throne, and, according to the historian Ibn Hadjar, proved himself to be "just, God fearing, and the patron of the meritorious." These excellent qualities did not, however, prevent his making a raid into Poland, which was conducted in the usual Mongol manner, nor did they save his countrymen from being decimated by the black plague, which for the first time in 1345 swept over Asia and Europe from the confines of China to Paris and London. With all their love of war the Mongols had a keen eye to monetary advantage, and Janibeg, who was no exception to the rule, concluded treaties with the merchant princes of Venice and Genoa, in which the minute acquaintance displayed with shipping dues and customs charges shows how great were the advances the Mongols had made in their knowledge of European commerce since the days of Jenghiz Khan. The throne Janibeg had seized by violence was, in 1357, snatched from him by violence. As he lay ill on his return from a successful expedition against Persia he was murdered by his son Berdibeg, who in his turn was, after a short reign, murdered by *his* son Kulpa. With the death of Berdibeg the fortunes of the Golden Horde began rapidly to decline. As the Uzbeg proverb says, "The hump of the camel was cut off in the person of Berdibeg."

But while the power of the Golden Horde was dwindling away, the White Horde or Eastern Kipchak, which was the inheritance of the elder branch of the family of Juchi, remained prosperous and full of vitality. The descendants of Orda, Batu's elder brother, being far removed from the dangerous influences of European courts, maintained much of the simplicity and vigour of their nomad ancestors, and the throne descended from father to son with undiminished authority until the reign of Urus Khan (1360), when complications arose which changed the fortunes of the tribe. Like many other opponents of the Mongol rulers, Khan Tuli Khoja paid with his life for his temerity in opposing the political schemes of his connexion Urus Khan. Toktamish, the son of the murdered man, fled at the news of his father's death and sought refuge at the court of the famous Timur-i leng (Tamerlane), who received him with honour and at once agreed to espouse his cause. With this intention he despatched a force against Urus Khan, and gained some advantage over him, but, while fitting out another army to make a fresh attack, news reached him of the death of Urus. Only at Sighnak are coins known to have been struck during the reign of Urus, and these bear date from 1372 to 1375.

He was followed on the throne by his two sons, Tuk Toktakia and Timur Malik, each in turn; the first reigned but tamish for a few weeks, and the second was killed in a battle against Toktamish, the son of his father's enemy. Toktamish now seized the throne, not only of Eastern Kipchak but also of the Golden Horde, over which his arms had at the same time proved victorious. His demands for tribute from the Russian princes met with evasion from men who had grown accustomed to the diminished power of the later rulers of the Golden Horde and Toktamish therefore at once directed an army into Russia. Having captured Serpukhoff, he advanced on Moscow. On the 23rd August 1382 his troops appeared before the doomed city. For one day the inhabitants bravely withstood the constant attacks on the walls but failed in their resistance to the treacherous stratagem which was so common a practice in Mongolian warfare. Within a few hours of their opening the gates to the Mongols who declared themselves the enemies of the grand prince alone and not of the people the usual result followed. The Russian general who was invited to Toktamish's tent was there slain, and at the same time the signal was given for a general butchery. Without discriminating age or sex the Mongol troops butchered the wretched inhabitants without mercy, and, having made the streets desolate and the houses tenantless, they first plundered the city and then gave it over to the flames. The same pitiless fate overtook Vladimir, Zvenigorod, Yuriefi, Mozhaisk, and Dimitroff. With better fortune, the inhabitants of Pereslavl and Kolomna escaped with their lives from the troops of Toktamish, but at the expense of their cities which were burned to the ground. Satisfied with his conquests, the Khan returned homeward, traversing and plundering the principality of Riazan on his way. Flushed with success Toktamish demanded from his patron Timur the restoration of Kharezm, which had fallen into the hands of the latter at a period when disorder reigned in the Golden Horde. Such a request was not likely to be well received by Timur, and, in answer to his positive refusal to yield the city Toktamish marched an army of 90,000 men against Tabriz. After a siege of eight days the city was taken by assault and ruthlessly ravaged. Meanwhile Timur was collecting forces to punish his rebellious *protégé*. When his plans were fully matured, he advanced upon Old Urgenj and captured it. More merciful than Toktamish, he transported the inhabitants to Samarkand, but in order to mark his anger against the rebellious city he levelled it with the ground and sowed barley on the site where it had stood. On the banks of the Oxus he encountered his enemy, and after a bloody battle completely routed the Kipchaks, who fled in confusion. A lull followed the victory, but in 1390 Timur again took the field. To each man was given "a bow, with thirty arrows, a quiver and a buckler. The army was mounted, and a spare horse was supplied to every two men, while a tent was furnished for every ten, and with this were two spades, a pickaxe, a sickle, a saw, an axe, an awl, a hundred bowstrings, a bow-cord, an ox's hide, and a strong pin." Thus equipped the army set forth on its march. After a considerable delay owing to an illness which overtook Timur his troops arrived at Kara Saman. Here envoys arrived from Toktamish bearing presents and a message asking pardon for his past conduct; but Timur was inexorable, and, though he treated the messengers with consideration, he paid no attention to their prayer. In face of innumerable difficulties, as well as of cold, hunger, and weariness, Timur marched forward month after month through the Kipchak country in pursuit of Toktamish. At

ruler of Egypt, that he sent to demand in marriage a princess of the house of Jenghiz Khan. At first his request was refused by the proud Mongols, but the present of a million gold dinars, besides a number of horses and suits of armour, changed the refusal into an acquiescence, and in October 1319 the princess landed at Alexandria in regal state. After a siege of eight days the city was taken by assault and ruthlessly ravaged. Meanwhile Timur was collecting forces to punish the rebellious vassal. When his plans were fully matured he advanced upon Old Urgenj and captured it. More merciful than Toktamish, he transported the inhabitants to Samarkand, but in order to mark his anger against the rebellious city he levelled it with the ground and sowed barley on the site where it had stood. On the banks of the Oxus he encountered his enemy, and after a bloody battle completely routed the Kipchaks, who fled in confusion. A lull followed the victory, but in 1390 Timur again took the field. To each man was given "a bow with thirty arrows, a quiver and a buckler. The army was mounted, and a spare horse was supplied to every two men, while a tent was furnished for every ten, and with each were two spades, a pickaxe, a sickle, a saw, an axe, and a hundred [illegible] cord, an ox's hide, and a [illegible] pin." Thus equipped the army set forth on its march. After a considerable delay owing to an illness which overtook Timur his troops arrived at Kara Saman. Envoys arrived from Toktamish bearing presents and a message asking pardon for his past conduct; but Timur was inexorable, and, though he treated the messengers with consideration, he paid no attention to their prayer. In the face of innumerable difficulties, as well as of cold, hunger and weariness, Timur marched forward month after month through the Kipchak country in pursuit of Toktamish.

t, on the 18th of June, he overtook him at Kandurcha, the country of the Bulgars, and at once forced him to an gagement For three days the battle lasted, and atter lining now to thi side and now to that victory finally de ed in favour of Timur. The Kipchaks were completely ted and fled in all directions, while it is said as many 100,000 corpses testified to the severity of the fighting. mur pursued his flying enemy as far as the Volga, ghtering all who fell into his hands, and ravaged and royed the towns of Sarai, Saraichuk, and Astrakhan. ving inflicted this terrible blow on the Golden Horde, mur distributed rewards to his chieftains and presided a series of banquets in celebration of his victory. These ings over, he returned to Samarkand laden with spoils trophies. But Toktamish, though defeated, was not dued, and in 1395 Timur found it necessary again to ertake a campaign against him. This time the armies upon the Terek, and after a fiercely-contested battle Kipchaks again fled in confusion When the victory gained, Timur, we are told, knelt down on the field returned thanks to Heaven for his success. The pur- along the Volga was vigorously undertaken, and th ghter among the fugitive was terrible. The hurried ance of T horsemen threw the Russians into a e of wild alarm, and the grand prince Moscow red that an ancient image of the Virgin which was ved to possess miraculous power should be taken to scow to save that city from the destroyer. Success eared to attend this measure, for Timur, threatened by advancing autumn, gave up all further pursuit, and red with a vast booty of gold trinkets, silver bars, pieces of broch linen and of the embroidered cloth of Russia, &c. his homeward march southwards he arrived before k, which was then the entrepôt where the merchants the east and west exchanged their wares. In vain the ves, with the Egyptian, Venetian, Genoese, Catalan, Basque inhabitants, besought him to spare the city answer was a command to the Moslems to separate nselves from the rest of the people whom he put to sword, and then gave the city over to the flames. ussia and Georgia next felt his iron heel, and the nesses of the central Caucasus were one and all oyed. After these successes Timur gave himself up a time to feasting and rejoicing, accompanied by every nite display of Oriental luxury. The tent or audience hung with silk, its poles were golden, or probably ed with golden plates, the nails being silver, its pe was of gold, enriched with precious stones, the illed with water. But his own

not satisfied, and, having refreshed his troops by this , he marched northwards against Astrakhan, which he ly destroyed. The inhabitants were driven out into country to perish with the cold, while the commander he city was killed by being forced beneath the ice of Volga. Sarai next shared the same fate, and Timur, ing thus crushed for the second time the empire of ingis Khan, on his return home by way of Derbend Azerbijan. The defeated khan succeeded shortly rwards in re-capturing Sarai, but, being again driven he retired in 1398 to Kiefl, a fugitive from his king n. During his reign, which lasted for twenty-four years, struck coins at Kharezm, Krim, New Krim, Azak, a, New Sarai, Saraichuk, and Astrakhan. The power he hands of the successors of Toktamish never revived the last campaign of Timur. They were constantly aged in wars with the Russians and the Krim Tatars, whom the Russians had allied themselves, and by es their empire decayed, until, on the seizure and th of Ahmed Khan at the beginning of the 16th cen- , the domination of the Golden Horde came to an end.

One solitary fragment of the Golden Horde, the Khan of Astrakhan, maintained for a time an existence after fall of the central power. But even this last remna ceased to be a Mongol apanage in 1554, when it w captured by the Russians and converted into a Russ province. The fate which thus overtook the Golden Ho was destined to be shared by all the western branches the great Mongol family. The khans of Kasan a Kasimoff had already in 1552 succumbed to the growi power of Russia, and the Krim Tatars were next fall under the same yoke. In the 15th century, wh the Krim Tatars first appear as an independent pow they attempted to strengthen their position by ally themselves with the Russians, to whom they looked help against the attacks of the Golden Horde. But wh they were in this state of dependence another power ar in eastern Asia which modified the political events of t region. In 1453 Constantinople was taken by Osmanli Turks, who, having quarrelled with the Geno merchants who monopolized the trade on the Euxine, s an expedition into the Crimea to punish the presumptu traders. The power which had captured Constantino was not likely to be held in check by any forces at t disposal of the Genoese, and without any serious oppo tion Kaffa, Sudak, Balaclava, and Inkerman fell before troops of the sultan Mohammed. It was plain th situated as the Crimea was between the two great pow Russia and Turkey, it must of necessity fall under direction of one of them. Which it should be w decided by the invasion of the Turks, who restored Men Girai, the deposed khan, to the throne, and virtua converted the khanate into a dependency of Constan nople. But though under the tutelage of Turkey, Men Girai, whose leading policy seems to have been the des to strengthen himself against the khans of the Gold Horde, formed a close alliance with the grand prince Iv of Russia. One result of this friendship was that Mongols were enabled, and encouraged, to indulge th predatory habits at the expense of the enemies of Russ and in this way both Lithuania and Poland suffer terribly from their incursions. It was destined, howev that in their turn the Russians should not escape fr the marauding tendencies of their allies, for, on pret of a quarrel with reference to the succession to the Kas throne, Mohammed Girai Khan in 1521 marched an ar northwards until, after having devastated the count massacred the people, and desecrated the churches on route, he arrived at the heights of Vorobieff overlooki Moscow. The terror of the unfortunate inhabitants the sight once again of the dreaded Mongols was extrem but the horrors which had accompanied similar p vastations were happily averted by a treaty, by wh the grand prince Vasili undertook to pay a perpetual tr ute to the Krim khans. This, however, proved but a tru It was impossible that an aggressive state like Russia shou live in friendship with a marauding power like that of t Krim Tatars. The primary cause of contention was t khanate of Kasan, which was recovered by the Mongo and lost again to Russia with that of Astrakhan in 15 The sultan, however, declined to accept this condition these as final, and instigated Devlet Girai, the Kr khan, to attempt their recovery. With this object t latter marched an army northwards, where, finding the ro to Moscow unprotected, he pushed on in the direction that ill-starred city. On arriving before its walls he fou a large Russian force occupying the suburbs. With the however, he was saved from an encounter, for just as foremost men approached the town a fire broke o which, in consequence of the high wind blowing at t time, spread with frightful rapidity, and in the spa

hours destroyed all the churches, palaces, and with the exception of the Kremlin, within a s of 30 miles. Thousands of the inhabitants d in the flames. "The river and ditches about y," says Horsey, "were stopped and filled with the ades of people, laden with gold, silver, jewels, ear-rings, and treasures. So many thousands were ourned and drowned that the river could not be for twelve months afterwards." Satisfied with struction he had indirectly caused, and unwilling to the Kremlin, the khan withdrew to the Crimea, ng the country as he went. Another invasion of , a few years later (1572), was not so fortunate for ongols, who suffered a severe defeat near Molodly, ts from Moscow. A campaign against Persia made ersion in the wars which were constantly waged n the Krim khan and the Russians, Cossacks, and So hardly were these last pressed by their pe ns enemies in 1619 that they bound themselves ty to pay an annual subsidy to the khan. But rtunes of war were not always on the side of the and with the advent of Peter the Great to the n throne the power of the Krim Mongols began to . In 1696 the czar, supported by a large Cossack nder Mazeppa, took the field against Selim Gerai and gained such successes that the latter was led to cede Azoff to him. By a turn of the wheel tune the khan had the satisfaction in 1710 of it restored to him by treaty; but this was the last ccess that attended the Tatar arms. In 1736 the ns in their turn invaded the Crimea, captured the ted lines of Perekop, and ravaged Bakchi Serai, ital. The inevitable fate which was hanging over rim Tatars was now being rapidly accomplished. 83 the Krim, together with the eastern portion of d of the Nogais, became absorbed into the Russian e of Taurida.

ther branch of the Mongol family which represents n is that of the Kazaks (see KIRGHIZ, vol. xvi. pp.), whose ancient capital was Sighnak, which, as we ren, passed into the hands of the great Timur. It ow only be necessary to refer briefly to the Uzbegs, n the destruction of the Golden Horde, assumed an ant position on the east of the Caspian Sea. The r of their greatness was the khan Abulkhair who d in the 15th century, and who, like another Jenghiz consolidated a power out of a number of small clans, lded lustre to it by his successful wars. Sheibani, his grandson, proved himself a worthy successor and ghty antagonist of the great Moghul emperor Babur. 00 he inflicted a severe defeat on Babur's forces, and ed Samarkand, Herat, and Kandahar. By these and conquests he became possessed of all the country between the Oxus and the Jaxartes, of Ferghana, Kharatissar, as well as of the territory of Tashkend from ar to the frontiers of China. In the following year, ushing exploit, Babur recovered Samarkand, but only it again a few months later. During several succeeding ars Sheibani's arms proved victorious in many fields tle, and but for an indiscreet outrage on the sister of the shah of Persia he might have left behind him erful empire. The anger, however, of Shah Ismael against him a force before which he was destined . The two armies met in the neighbourhood of where, after a desperate encounter, the Uzbegs completely defeated. Sheibani, with a few followers refuge in a cattle pound. But, finding no exit on rther side, the refugees tried to leap their horses the wall. In this attempt Sheibani was killed, his body was recognized by his exultant enemies they cut off the head and presented it to the sha caused the skull to be mounted in gold and to be con into a drinking cup. After this defeat the Uzbegs wit across the Oxus and abandoned Khorasan. Further news aroused Babur to renewed activity, and before he reoccupied Samarkand and the province "Beyon River," which had been dominated by the Uzbegs fo years. But though the Uzbegs were defeated, they w no means crushed, and ere long we find their khan re now at Samarkand and now at Balkh. A time and European power began to encroach more and nate Asia the history of the Khanate ceases to be c to the interneeine struggle of rival khans. Even Ba was not beyond the reach of Russian ambition and I diplomacy. Several European envoys found their further during the first half of the present century the murder of Stoddart and Conolly in 1842 fo melancholy episode in British relations with that ba capital. With the absorption of the khanate of Bo and the capture of Khiva by the Russians the indi history of the Mongol tribes in Central Asia comes

There are four regular conjugation and derivative form derived from me by suffixes, are computed on the same scheme. Gram sive has suffixed *-ta* or *-tda* (*bar-tdakhu*, to be ca peth); ve *-gul* (*mandagulkhu*, to cause to carry); the cooperative ve *-ldsa* or *-ldsa* (*bar-ldsakhu*, to carry together). re are no prepositions, only post-positions. Adverbs are also e particles (affirmative, negative, interrogative, modal, etc.) formed by suffixes from other part of speech. There are few conjunctions, the relations of clauses and sentences are y indicated by the verbal forms (part., cup., conditional, etc.) v by the gerund).

e order of words and sentences in construction is pretty much pposite of that which we follow. In a simple sentence the ation of time and place, whether given by an adverb or a nou ve with a post-position, always comes first; then comes the t, always preceded by its adjective or genitive, then the object ther cases depending on the verb, last of all the verb itself ded by any adverbs that belong to it. So in the structure of od all causal, hypothetical, concessive clauses which can be ived as preceding the main predication in point of time, so as contemporary with it, or as in any way modifying it, must first, the finite verb appears only at the end of the main ation or apodosis. The periods are longer than in other uages; a single one may fill several pag

ammars and dictionaries may be divided according to the Buria dialect st Mongolian, I. J. Schmidt gave the first grammar (Det rsb 1 II), and golian-German-Russian dictionary (Peterb., 1835). Next to know how it hed in Russia are a Mongolian grammar (Kazan, 1) and a Buriat-Mongolian-Russian dictionary (Kazan, 1846–47), and in great *Dictionnaire mongol-français* (Paris, 1844, 1846, 1850). We name also R. Vasili, *Sur la Mongolie et les Mongols* (Mongolian), xylographed at the mission press at Peking in 1838, and A. Bobrownikow's Russian *Grammar of the Mongol-Buriat* (Kazan, 1849) is also very good. An abridgment of Schmidt's Pallas, *Elements della grammatica mongolica* (Florence, 1), A. Popow's *Vom Ober-Tanguthischen* appeared in Vienna at Kazan (1858). For the Kalmuk e grammars by Popow (Kazan, 1847), Bobrownikow (Kazan, 1849), as *Lehrb.*, autographed at Donaueschingen (1849), Zwick (also autographed k and German dictionary with a printed German key appeared n 1852, B. Jülg's edition of the fable of Siddhi-kur (Leipzig, 1) plete glossary to the stories. There are small but excellent ulaties by P. Smirnow (Kazan, 1857) and C. Goldmann (St Petersb., 1869).

For the Buriatic we have Castrén, *Versuch einer Buriatischen Sp* edited by Schiefner (1857) and A. Orlow's Russian grammar of the Mon ate colloquial language (Kazan, 1875).

Literature. A clear distinction must be drawn be written or book language and the comm day life. The difference between the fairly compared to that between the Modern High German boo the different dialects. All grammars and dictionaries as yet pu nly of the book language, and so far with a few exceptions the literary documents are wr ept *Ö-ts-khaas*, and the *south* Gobi and Ala. The population ar on the b lived in wigwams by A. Pozdn Russian ser of the l who b certain rights to land in the form of hereditary fiefs. The literature I have at present access to [illegible] Tibetan, the Buddhist sacred language of Buriatia, is still the lan guage of the Buriat Lamaist priesthood. The Tibetan letters (*Uchen*) are used in the hom e-books, such as Mongol [illegible] Lamaist services, but the Buriats themselves [illegible] the Tibetan (*Uchen*) the Buriat-Mongol [illegible] ers, for instance with the fable of Siddhi-kur. that interest he laboured, while retaining his free-
from party ties, to make himself indispensable as a
The government of Dublin was vacant, and Monk
pointed by Leicester. But Charles I. overruled the
ment in favour of Lord Lambert, and Monk, with
brave words, gave up his claim. Ormond, however,
ewed him with suspicion as one of the two officers
used the oath to support the royal cause in Eng-
ent him under guard to Bristol. He now deemed
t to affect Royalist views. His value caused him
received at once into Charles's confidence, he was
ed major-general of the Irish brigades, and served
Byron at the siege of Nantwich. Here he was
ner-owned by Fairfax, on 25th January 1644 in one
most skilful operations of the war. After a short
y in Hull he was placed in the Tower, where he
d for three years, during which his father died,
ng his time partly in writing his *Observations*
ary and Policy of Wars.
ing the war Monk could not be released,
, however, became a prisoner, the troubles in
made the parliament anxious to secure Monk's
, and he was told that if he would take the Cove-
might have an important command. With some
hesitation the terms were accepted, and, after a
of two months in Lord Leven's abortive expedition,
was placed in command of the Parliamentary forces in the
f Ireland. Compelled in 1643 to conclude a pacifi
with the rebel O'Neill, he returned to England after
g's execution. In the next year he succeeded, by
brother's death, to the Devonshire estates. He remained
out a short while. Cromwell gave him a regiment
command of the ordnance in the Scotch war of
nd after the battle of Dunbar, in which he left the
he was left with 6000 men to "settle the country,"
after taking Edinburgh, Tantallon, and Stirling
he did most completely in a few weeks. In 1651
sted with fever, but recovered at Bath and in
e year was appointed on the commission for pro-
the Union. In 1653, with Admiral Penn, he
anded the British fleet against the Dutch, and on
3d June and 29th July fought two of the most
ary naval battles on record, in which both Blake
and Van Tromp were slain. A peace on very
favourable to the Dutch was concluded, but politi-
ly Cromwell's fellow-soldiers considered, a course
on which Monk heartily concurred. On his
he married Anne Clarges, a woman of
e Covenanting chaplain honestly dowdy, "as
who, like other writers who mention her, is unduly
s complaisance. Monk was now sent to quell the
headed by Middleton in Scotland, and, when this
was over, settled down to a steady government of
ntry for the next five years. For fanaticism in any
e had no sympathy, and he set himself to diminish
uence of the Presbyterian clergy. Cromwell's chief
nts, taking from them the power of excommuni
and their general assemblies, but allowing them to
retain their presbyteries. Equal repression was ex
against the nobility and gentry. The timely discov
plot fomented by Overton for killing Monk on New
Day gave him an excuse for thoroughly purging h
of all Anabaptists, Fifth Monarchy men, and other
ous enthusiasts. It is doubtful whether at this tim
had proposed to himself the restoration of the kin
probably had it always in his mind as a possibility,
would run no risks. His very reticence, however,
alarm on one side and hope on the other. In
received a letter from Charles II., a copy of which
once sent to Cromwell, whom, however, we find wr
him in 1657 in the following terms: "There be s
me that there is a certain cunning fellow in Scotland
George Monk, who is said to lye in wait there to in
Charles Stuart; I pray you, use your diligence to
hend him, and send him up to me."

During the confusion which followed Cromwell's
Monk remained silent and watchful at Edinburgh,
only to secure his hold on his troops. In July
direct and tempting proposals were again made
by the king. His brother Nicholas, a clergyman, w
ployed by Sir J. Grenvil to bring to him the subst
Charles's letter. No bribe, however, could induce
act one moment before the right time. He h
brother go back to his books, and refused to entert
proposal. But when Booth rose in Cheshire for th
so tempting did the opportunity seem that he
the point of joining forces with him; and a lett
written to the Rump parliament threatening ton
did not at once fill up its numbers. His habitual c
however, induced him to wait until the next pos
England, and the next post brought news of
defeat. On 17th October he heard of Lambert's
defeat. From that moment his plan of action se
have been settled. In most vehement language
derided the idea of restoring Charles, and, with ad
perception of the state of English feeling, took
principles that in all cases the army must obey t
government, and that the civil government re
parliamentary. At present the Rump was crushed
military party; the first thing, therefore, to be done
free it. His army underwent a second purging
affection and he then issued a declaration embody
principles mentioned above, and wrote to Lenth
speaker, and to the military party to the same
In a treaty with the Committee of Safety his commis
who were to treat only on the basis of the restora
parliament, were outwitted. Monk at once refu
to accept the terms proposed, and marched to Berwick,
received an offer from Fairfax of assistance if he
promise that the secluded members should be re
Meanwhile Lambert had marched northwards to
his advance.

Monk's action gave fresh heart to the adherents
parliament. The old council of state met, and
him general of all the forces; the fleet and th
army hitherto hostile, came round to his side, and
Whetham at Portsmouth. Monk now, in the de
winter crossed the Tweed at Coldstream and marc
Morpeth to Newcastle, receiving letters on his wa
the lord mayor and corporation of London urging
declare for a free parliament. On his approach La
army fell away from their general, and no obsta
marched on the path to London. At York, when u
Fairfax, he refused to declare for the king, and is
have caned an officer who affirmed that such w
design. The parliament now ordered him to c
London. Fleetwood's army which occupied the ci
however, a great obstacle; and it was not until the

rise to the height, while he showed how unwilling
ument of its will he was. On the 11th, however,
w off the mask, and wrote to the Rump, peremp
dering them to admit the secluded members, and
ge for the dissolution of parliament by 6th May.
t February he conducted the secluded members
seats. At the same time he refused to restore
ds, and issued an order disowning Charles Stuart
fficers commanding garrisons. Every day brought
sh opportunities for tact or evasion. His partisans
im to take the protectorate himself; another party
upon him to accomplish the restoration by the
one, a body of his officers sent him a declaration
ing their fears that his action would lead to the
ion of monarchy; the parliament tried to make
eir own by the offer of Hampton Court. His
habits of dissimulation and evasion, assisted now
ain by downright lying, carried him triumphantly
all these dangers, and at length the dissolution of
ent on 17th March removed his greatest difficulties.
as now that, with the utmost secrecy, he gave an
w for the first time to the king's agent Grenvil,
him sent to Charles the condition of his restoration,
rds embodied in the Declaration of Breda. For
at present he would accept nothing but a royal
sion as captain-general, which he carefully kept
elf. All parties were anxious to gain the credit of
v certain restoration. The Presbyterians in parti-
fearful of the king being restored without terms,
ir best to discredit Monk and to impose the old hard
t conditions; but in vain. The new parliament was
and the House of Lords restored, an insurrection
bert, who had escaped from the Tower, was quelled
k's prompt measures, and on the 25th of April he
l the solemn thanks of both Houses, and the title of
general of the land forces. Even yet the fabric
pt up. Monk received with feigned surprise the
official letter from Grenvil, denied all knowledge
ontents, and handed it over sealed to the council
cided to defer opening it until the meeting of
ent on the 1st of May.

the Restoration the historic interest of Monk's career
The rude soldier of fortune had played the game
comparable dexterity, and had won the stakes. He
ade gentleman of the bedchamber, knight of the
master of the horse, commander-in-chief and duke of
arle, and had a pension of £7000 a year allotted him
most desires were satisfied, and he made no attempt to
e further in a society in which neither he nor his
wife could ever be at home, and which he heartily
d. As long as the army existed of which he was
l, and of which the last service was to suppress
's revolt, he was a person not to be displeased
entirely concurred in the measure for disbanding
thenceforward his influence was small, though men's
rned naturally to him in emergency. In the trial
regicides he was on the side of moderation, and his
interposition saved Hazelrig's life; but his action at the
time of Argyll's trial will always be regarded as the most
dishonourable episode in his career. In 1664 he had
charge of the admiralty when James was in command of
the fleet, and when in 1665 London was deserted on
account of the plague, Monk, with all the readiness of a
man accustomed to obey without thinking of risk, remained
in charge of the government of the city. Once more, at
the end of this year, he was called upon to fight, having a
joint commission with Prince Rupert against the Dutch.
The whole burden of the preparations fell upon him. On
23d April 1666 the admirals joined the fleet, and on the 1st
of June began a battle near Dunkirk which lasted four days,
followed by another on 25th July, in which Monk showed
all his old coolness and skill, and a reckless daring which
had seemed hitherto foreign to his character. His last
service was in 1667, when the Dutch fleet sailed up the
Thames, and Monk, ill as he was, hastened to Chatham to
oppose their further progress. From that time he lived
much in privacy, and died of dropsy on the 3d of December
1669.

See the *Life of Monk* by Dr Gumble his chaplain (London, 1671)
and Dr Skinner (London, 1724), and *Clarendon's Life*, which contain
all the contemporary information concerning him up to the Restoration.
The numerous and more scattered notices of him in the court of Charles
II. Pepys's *Diary* should also be consulted. (O. A.)

MONKLY. See Ayr.

MONMOUTH, a maritime county of England, is bounded
E by Gloucester, N.E. by Hereford, N.W. by Brecknock,
W. and S.W. by Glamorgan, and S. by the Bristol Channel.
Its greatest length from north to south is about 35 miles,
and its greatest breadth about 27 miles. The area is
368,399 acres, or about 575 square miles.

The surface of Monmouth is very varied, and in many
districts picturesque, especially along the valley of the
Wye, and between that river and the Usk. In the west
and north the hills rise to a considerable height, and the
mountain region consists chiefly of finely undulating country.
The highest summits are Sugar Loaf (1954 feet), Blorenge
(1908), and Skyrrid Vawr (1595). Along the shore on
both sides of the Usk are two extensive tracts of marsh
land, called the Caldicot and Wentlooge levels, stretching
from Cardiff to Goldcliff and protected from inunda-
tions by [illegible]

The principal rivers [illegible] the Wye, which forms the
eastern boundary of the county with Gloucester, and falls
into the Severn. Monnow, which forms a portion of its
boundary with Hereford, and falls into the Wye at
town of Monmouth; the Usk, which rises in Brecknock
and flows [illegible] through the centre of the county to the
Bristol Channel below Newport; the Ebbw, which rises in the north-west
and enters the estuary of the Usk at Newport; and the
Rhymney, which rises near Brecknock, and, after forming the
boundary between Monmouth and Glamorgan, enters the
Bristol Channel a little to the east of Cardiff. Salmon
abound in the Wye and the Usk, and trout are
plentiful in all the streams. The Monmouthshire canal
extends from Newport to Pontypool, where it is joined by
the Brecknock-and-Abergavenny canal, which enters the county near
Abergavenny. The Crumlin canal also joins it a little
to the east.

[illegible] The [illegible] mation is principally
old Red Sandstone and Carboniferous, the Old Red forming the
lower and eastern half of the county, from a line drawn between
Abergavenny and Newport, and varying in its lines from between
one and 10,000 feet in the north to about 4000 feet in the south.
In the centre of the county, about the Usk, there is an outcrop
of Silurian rocks extending to a distance of about 8 miles north
and south and 4 miles east and west with a thickness of 1500 feet.
Toward the east the Old Sandstone rocks dip beneath the Mon-
tian Limestone, which enters the county from the Forest of Dean
coal-field, and gives its peculiar character to the fine scenery along
the banks of the Wye. The formation varies in thickness from

00 feet. The Carboniferous rocks connected with the great
l of South Wales, which occupy the western half of the
include the Carmarthen, consisting of shale and
es, sandstone and [illegible], of which there are about
ive beds, more than feet thick; total thickness of the

ge. The population increased from 9662 in 1870 0 in 1880. The city charter dates from 1857

NMOUTH, James, Duke of (1649-1685), was the Lucy Walters, "a brown, beautiful, bold but insipid ce," who became the mistress of Charles II during ile at the Hague. He was born at Rotterdam on pril 1649. That Charles was his father is more oubtful, for Lucy Walters had previously lived with Sidney, brother of Algernon, and the boy resembled im very closely. Charles, however, always treated mm as his son, and lavished on him an almost doting on. Until the Restoration he was placed under the rst of Lord Crofts, and then of the queen-dowager, ng his education to the age of nine from Roman ics, but thenceforward from Protestant tutors. In 662 he was sent for by Charles, and at thirteen was under the protection of Lady Castlemaine and in the le of the worst influences of the court. No formal wledgment of his relation to the king was made his betrothal to Anne Scott, daughter of the earl of nch, and the wealthiest heiress of Scotland, whom rried in 1665. During 1663 he was made duke of y, duke of Monmouth, and knight of the Garter, ceived honorary degrees at both universities At he was treated as a prince of the blood. In 1665 ed with credit under the duke of York in the naval battle off Lowestoft A captaincy in the uards was given him, and in 1670, on the death of he was made captain-general of the king's forces, s of wealth also were showered upon him, and he was ed to the privy council. In 1670 Monmouth was he court at Dover, and it is affirmed by Reresby he mysterious death of Charles's sister, the duchess eans, was due to her husband's revenge on the discovery of her intrigue with the duke It is certain, from try by Pepys, that as early as 1666 he had a bad a character for vice and profligacy He was the author of the attack in December 1670 on Sir John try, and only a few months later received the royal n for his share in the wanton murder of a street man. De Gramont, in his vivid sketch of Monmouth, after describing the beauty and bodily prowess for he was celebrated, notices the fatal emptiness and y of his mind: "Tous les avantages du corps parurent pour lui; mais son esprit ne disait pas un petit mot faveur. Il n'avait de sentimens que ce qu'on lui en nait."

herto Monmouth had been but the spoiled child of xed court. Now, however, by no act or will of his own, he began to be a person politically important early as 1662 the king's excessive fondness for his caused anxiety. Even then the fear of a "diffe between Monmouth and James, duke of York, ex men's minds; and every caress or promotion kept t alive. Who could tell but that, in default of legitimat from his queen, Charles might declare Monmouth lawful on? A civil war would be the certain conse Soon after 1670 the matter took a more serious The anti-popery spirit was rapidly becoming a and the succession of James a probability and a Charles was moved to legitimize Monmouth by a d tion of his marriage with Lucy Walter. He re answer that, much as he loved the duke, he would see him hanged at Tyburn than own him for his mate on. Every attempt, however, was henceforth especially by Shaftesbury, to accustom people to thi He was taught to regard himself as the representa the Protestant interest, and his precarious was emphati James's second marriage with the Roman Catholic p Mary of Modena From the time the popular title wa Protestant duke. Charles was induced to confer prominent employments upon him. The influence of however, was strong enough to prevent his obtaining lord lieutenancy of Ireland but he received the com of the 6000 troops who acted against the French in the Dutch war and though without any claim to gener behaved with courage in the field. In 1674 he was commander-in-chief, and, in connexion with this, a no necessary attempt, graphically described in C *Life of James*, was made to gain from Charles admission of his legitimacy At Shaftesbury in he was placed in command of the army employed a against the Scottish Covenanters and was present at well Bridge (22 June 1679). He was also, at the request, elected chancellor of the university of Cam In 1678, when Charles was driven into war with Monmouth took the command of the English contin and again gained credit for personal courage at the of St Denis On his return to London England the throne of the popish successor. The idea of crea Protestant successor, by stamping Monmouth aga hope and was carefully fostered by Shaftesbury, time it seemed probable that a new would want audacity

The Pensionary parliament was dissolved in J 1679, and was succeeded by one still more dete anti-popery spirit. To avoid the storm, and t of possible, his brother's stated Catholic instructo to leave the country. James returned to Brussels, th became presently known a declaration that he never married nor ever contract to any woman wha but to my wife Queen Catherine. In spite of thi month might naturally now nourish ambitious His rival was Shaftesbury, who, chief m was president of the remodelled privy council, but he still was the favourite of the city. In the sum 1679 the Popish Plot, fabricated by Titus Oates, and the dangers o plot now became terribly apparent The opposed to Monmouth, or rather to Shaftesbury prevailed on Charles to consent to his brother's return When, after the king's recovery, went back to Brussels, he received a promise that mouth too should be removed from favour and to leave the country. Accordingly, in September the latter repaired to Utrecht, while shortly aft James's friends so far gained ground as to obtain permission to reside at Edinburgh instead of at B Within two months of his arrival at Utrecht, Mo secretly returned to England, arriving in London

ber. Shaftesbury had assiduously kept alive the pery agitation, and Monmouth, as the champion of antism, was received with every sign of popular

The king appeared to be greatly incensed, d him of all his offices, and ordered him to leave ndon at once. This he refused to do, and the only taken of the disobedience was that Charles forbade appear at court.

s at this time that the *Appeal from the Country to* written by Fergusson, was published, in which ttorney was totally given up, and in which it was that "he that hath the worst title will make the g." Now it was too that the exclusionists, who, absence of parliament, were deprived of their best agitation, developed the system of petitioning. mptly and successfully was this answered by the ers' that Charles, feeling the ground safer under called Jane to London, a step immediately fol by the resignation of the chief Whigs in the council. more, however, a desperate attempt was made, by le of the "black box," to establish Monmouth's and once more these claims were met by Charles's declarations in the *Gazette* that he had never been but to the queen. Still acting under Shaftesbury's Monmouth now went upon the first of his progresses west of England, visiting the chief members of the party, and gaining by his open and engaging much popularity among the people. In August ames returned to Portsmouth, but right to the re being again formally acknowledged by Charles outh at once threw himself more vehemently than to the plans of the exclusionists. He spoke and for exclusion in the House of Lords, and it of his not likely to be forgotten by James when in opportunity should come for resenting it. He was ostentatiously feasted by the city, the stronghold of Shaftesbury's party, and it was observed that he drove to dinner that day of illegitimacy had been removed from the arms on his coach.

The year 1681 seemed likely to witness another civil war. The parliament that had been summoned by formal proclamation passing a series of resolutions of extreme violence, of which one was that Monmouth should be restored to his offices and command, and when Charles summoned the parliament to meet at Oxford the leaders of the exclusionists went thither with troops of armed men, until the dissolution of this last parliament on March 1681 did the weakness of Monmouth's cause become apparent. In a moment the ground was cut from under the feet of his supporters. Their battle for agitation was fought with pamphlets and broadsheets could ill supply the place of a determined and unanimous majority of the House of Commons. The deep-seated respect for hereditary succession felt, and a great reaction took place. Dryden published *Absalom and Achitophel*, a story which was well known to the time by a nickname. Monmouth himself did not escape unscathed from the pulpit. He thought it wise to make his peace with the king, but he did so in such a manner as to offend Charles the more. He was forbidden the court and, when he went on a second progress through the west and north western counties, his proceedings were closely watched, and he was at length arrested at Stafford. Severity and extreme lenity were strangely mingled in the treatment he received. He was released on bail, in February 1683, after the flight and death of Shaftesbury, openly broke the implied condition of his bail by making a third visit to Chichester with Lord Grey and others on pretence of a hunting expedition.

It is probable that Monmouth never went so far as to think of armed rebellion; but there is little doubt that he had talked over schemes likely to lead to this, and that Shaftesbury had gone further still. The Rye House Plot gave an excuse for arresting the Whig leaders; Russell and Sidney were judicially murdered; Monmouth was sent to Toddington in Bedfordshire, and was left untouched. Court intrigue favouring him, he succeeded, by the betrayal of his comrades and by two submissive letters, in reconciling himself with the help of Halifax both to the king and to James, though he had the humiliation of seeing his confessions and declarations of penitence published at length in the *Gazette*. His character for pettishness and vanity was now amply illustrated. He denied that he had given evidence; he then wrote a recantation of the denial. He managed by importunity to get from the king the promise of recantation and lastly, by the advice of his wife, offered again to sign the paper which he had withheld. Charles heartily despised him, and yet appears to have retained affection for him. His partial return to favour raised the hopes of his partisans; to check these, Algernon Sidney was executed. Monmouth was now subpoenaed to give evidence at the trial of young Hampden. To escape from the difficulties thus opened before him he went to Holland, probably with Charles's connivance, and from there he once more, in November 1684, visited England. It is doubtful whether he ever again saw the king. From this time till the king's death he lived with Henrietta Wentworth, his mistress, in Holland and at Brussels.

The quiet accession of James II soon brought Monmouth to the crisis of his fate. Though at first desirous of retirement, his character was too weak to withstand the urgency of more determined men. Within two months of Charles's death he had yielded to the impetuosity of Argyll, another of the exiles, and to vague invitations from England. Burnet comments, as showing the light in which his character were viewed by his fellow-conspirators, that one of the terms of the compact between them was that, if Monmouth should lead the expedition, he should not assume the title of King without their consent, and should, if the rebellion were successful, resign it and accept what reward the nation might offer. Now, as always, he was a puppet in other men's hands.

On the 2nd of May Argyll sailed with three ships from the west of Scotland, and three weeks later, with a total force of only eighty two persons, of whom Lord Grey, Fletcher of Saltoun, Wade, and Fergusson, the author of the *Appeal from the Country to the City*, were the chief, Monmouth himself set out for the west of England, where, as the head of Protestant dissent and as the scene of his former progresses, he could alone hope for immediate support. Here, however, there was no movement; and when on the 11th June Monmouth's three ships, having eluded the royal fleet, arrived off Lyme Regis, he landed amid the curiosity rather than the sympathy of the inhabitants. In the market place his "declaration," drawn up by Fergusson, was read. In this document James was painted in the blackest colours. Not only was he declared to be the murderer of Essex, but he was directly charged with having poisoned Charles to obtain his crown. Monmouth soon collected an undisciplined body of some 1500 men, with whom he marched to Axminster, and entered Taunton. Meanwhile the government had declared it treason to assert Monmouth's legitimacy, or his title to the crown; a reward of £500 was offered for him dead or alive, and an act of attainder was passed in unusual haste. Troops had been hurried from Flanders to meet him, and when he reached Bridgwater Albemarle was already in his rear. From Bridgwater the duke marched through Glastonbury to attack Bristol, into which Lord Feversham had hastily thrown a regiment of

ls. The attempt, however, miscarried; and, after
ioning Bath in vain, Monmouth, with a disordered
, began his retrograde march through Philips Norton
Frome, continually harassed by Feversham's soldiers.
he latter place he heard of Argyll's total rout in the
ern Highlands. He was now anxious to give up the
prise, but was overruled by Grey, Wade, and others.
he 3d of July he reached Bridgwater again, with an
little better than a rabble, living at free quarters
behaving with reckless violence. On Sunday the 5th
rsham entered Sedgemoor in pursuit, Monmouth the
night attempted a surprise, but his troops were hope
routed. He himself, with Grey and a few others,
over the Mendip Hills to the New Forest, hoping to
the coast and escape by sea. The whole country,
ver, was on the alert, and at midnight on the 8th,
n a month of their landing, James heard that the
t, desperate from the first, was over, and that his rival
een captured close to Ringwood, in Hampshire.
e poor strain in Monmouth's character was now
n. On the day of his capture he wrote to James in
s of the most unmanly contrition, attributing his wrong
gs to the action of others, and imploring an interview.
he 13th the prisoners reached the Tower, and on
ext day Monmouth was allowed to see James. The
nts of this interview are difficult to reconcile in some
s, but all agree that Monmouth's behaviour was un
y in the extreme. No mercy was shown him, nor did
the least deserve mercy; he had wantonly attacked
peace of the country, and had cruelly libelled James.
king had not, even in his own mind, any family tie to
ain him from exercising just severity, for he had never

ONOPOLI, a city of Italy, in the province of Bari, is
ated on the coast of the Adriatic, 25 miles by rail
-east of Bari. It is a bishop's see, is surrounded by
ancient walls, and possesses a castle built by Charl
1502, a cathedral, and a hospital dating from 1368.
harbour is neither large nor well protected, but a
amount of trade is carried on in the export of lo
ducts. The population was about 12,000 in th
century; 12,377 in 1861; and 13,000 in 1871,
the commune being 20,918. Monopoli probably
after the destruction of Egnatia (5th century), th
of which lie a few miles to the south.

MONOPOLY (*povwoτία, exclusive sale*). Thou
used in the sense of the original Greek, the term i
accurately applied only to grants from the crown
parliament, the private act of an individual whe
obtains control over the supply of any particular
being properly defined as "engrossing." It was fr
practice of the sovereign granting to a favourite,
reward for good service, a monopoly in the sale or
facture of some particular class of goods that the
of protecting inventions arose, and this fact lends ad
interest to the history of monopolies (see PATENTS).
the practice of making such grants first arose it d
appear easy to say. Sir Edward Coke laid it dow
by the ancient common law the king could grant
inventor, or to the importer of an invention from al
temporary monopoly in his invention, but that gr
restraint of trade were illegal. Such, too, was the l
down in the first recorded case, Darcy v. Allin (the
monopolies, 1602), and this decision was never ove
though the law was frequently evaded. The pate
of the Plantagenets show how few instances of grants of
polies (the earliest known is temp. Edw. III.)
own to the reign of Henry VIII. before
much evidence of the exercise of the prerogative
case of either new inventions or known articles, of
Elizabeth, as is well known, granted patents of mo
so freely that the practice became a grave abuse,
gave rise to
Houses of Commons. Lists prepared at the time sho
many of the commonest necessaries of life were the
of monopolists by which their price was previously en
That the queen did not assume the right of makin
grants entirely at her pleasure is, however, not only
own statement in answer to addresses from the Hou
by the fact that the preambles to the instruments
give the grant always set forth some public benefit
derived from their action. Thus a grant of a mo
to sell playing cards made, because "divers subj
able people, which never did use to plough did employ
themselves in the trade or mystery of cards," and one for t
of starch was protested on the ground that it would
wheat long wasted for the purpose. Accounts
angry debates in 1597 and 1601 are given in Hu
elsewhere. The former debate produced a promi
the queen that she would be careful in exercis
prerogative, the latter a proclamation which, receiv
great joy by the Houses, really had but little e
stopping the abuses complained of. A few gran
cancelled, other limited, and others again left to th
the ordinary law courts instead of the privy c
in pursuance of the results of the proclamation, p
were soon found to have been tainted by the promise
the queen's speech, protests by no means called
the text of the document itself, a copy of which is
in the British Museum.

In the first parliament of James I. a "commi
grievances" was appointed, of which Sir Edward C
chairman. Numerous monopoly patents were bro
before them, and were cancelled. Many more, h
were granted by the king, and there grew up a
"purveyors," who made use of the privileges grante

e great seal for various purposes of extortion. One
o t notorious of these was Sir Giles Mompesson,
l the country to avoid trial in 1621. After the
tion of several bills, and several attempts by James
ecure the matter by orders in council and
, the Statute of Monopolies was passed in 1623.
e all monopolies illegal, except such as might be
by parliament, or were in respect of new manu-
or invention. Upon this exceptive clause is built
ntire English system of letters patent for inven
statute itself amended by later Acts, chiefly
The Act was strictly enforced, and by it and the
m of monopolies was eventually abolished. This
not indeed immediately achieved, for even during
ectorate cases of monopoly patents were brought
the patents complained as grievances. Parliament
ourse, never exercised the power of granting to any
t exclusive privilege of dealing in any article of
ch. The prohibition of the Statute to monopolies,
beside required to be taken out by decision in
ts, tobacco, &c., are lineal descendants of the old
y grants, while the quo warranto proceedings
, canal, gas and water companies were under Acts
ment, and representative of the recent practice
OTHELETES (*μονοθελητής*, *monothelita*) was the
ven to those who, in the 7th century, while other
hodox, fell into the heresy of maintaining that
ad only one will. The monothelite controversy
origin in the efforts of the emperor Heraclius to
, for the church and the empire, the excommunicated
d persecuted Monophysites or Jacobites of Egypt
ia. It seems to have been while in Armenia in
t, in an interview with Paul, the head of the
s (Monophysites) there, he first broached the doc
the *mia energeia* of Christ, viz., the doctrine that
e and human nature, while quite distinct in He-
on, had but one activity and operation.[1] At a
at later date he wrote to Arcadius of Cyprus, com
that "two energies" should not be spoken of,
26, while in Lazistan (Colchis), he had a meeting
metropolitan, Cyrus of Phasis, during which this
d was discussed, and Cyrus was at last bidden seek
ruction on the subject from Sergius patriarch
antinople, a strong upholder of the *mia energeia*,
emperor's counsellor with regard to it. So well
profit by the teaching he received in this quarter
630 or 631, Cyrus was appointed to the vacant
ate of Alexandria, and in 633 succeeded in reconc
e Severians of his province on the basis of *mia*
a energeia (one divine human energy). He was
, opposed by Sophronius, a monk from Palestine,
r vainly appealing to Cyrus, actually went to Con
ple to remonstrate with Sergius himself. Shortly
d Sergius wrote to Pope Honorius, and received
ly reply. Sophronius, however, who meanwhile
n made patriarch of Jerusalem (634), refused to be
, and in his *Epistola Synodica* strongly insisted on
e energies. So interested did the controversy now
that at last, toward the end of 638, Heraclius
ed his *Ecthesis* or Exposition of the Faith, which
ed the use of the phrase "one energy," because of
nating effect on some minds, as seeming to militate
the doctrine of the two natures. While, on the other
e expression "two energies" was interdicted because

ding to some church historians, it was Paul who introduced
ne, but this statement seems to rest on a misinterpretation
hority. See Hefele, *Conciliengesch.*, iii. p. 124 *sq.* (1874),
races the previous history of the expressions *μία ἐνέργεια*,
ενέργεια, especially as found in the writings of the Pseudo-
Areopagita.

it seemed to imply that Christ had two wills. That Christ had but one will was declared to be the only orthodox doctrine, and all the faithful were enjoined to hold and teach it without addition or deduction. The document was not acceptable, however, to Popes Severinus and John IV., the immediate successors of Honorius; and Maximus, the confessor, succeeded in stirring up such violent opposition in North Africa and Italy that, in 648, Constans II. judged it expedient to withdraw his grandfather's offensive edict, and to substitute for it his own *Typus* (*τύπος περὶ πίστεως*), forbidding all discussion of the questions of the duality or unity of either the energy or the will of Christ. The scheme of doctrine of the first four general councils, in all its vagueness as to the exact points, was to be maintained so far as the controversy had gone, the disputants on either side were to be held free from censure, but to revive it would involve penal consequences. The reply of the Western Church was promptly given in the uncompromisingly dyothelite decrees of the Lateran synod held by Martin I. in 649, but the cruel persecutions to which both Martin and Maximus were exposed, and finally consummated, forced for the imperial *Typus* the assent at least of silence. With the accession of Constantine Pogonatus in 668 the controversy once more revived, and the new emperor resolved to summon a general council. It met at Constantinople in 680, having been preceded in 679 by a brilliant synod under Pope Agatho at Rome, where it had been agreed to depart in nothing from the decrees of the Lateran synod. At Constantinople the condemnation of the monothelite heresy was explicit and complete, Pope Honorius being anathematized by name along with the others who had supported it. Beyond the limits of the empire, monothelitism survived for some centuries in Lebanon among the MARONITES (*q.v.*), who did not abjure their heresy until 1182.

See the church histories, and especially Hefele (*op. cit.*), whose obvious partisanship can only slightly affect the reader's appreciation of his full and accurate learning.

MONREALE, a contraction of "monte reale," was so called from a palace built there by the Norman Roger I., king of Sicily. It is now a town of about 16,300 inhabitants, situated 5 miles inland from Palermo, on the slope of Mount Caputo overlooking the beautiful and very fertile valley called "La Conca d'Oro" (the Golden Shell), famed for its orange, olive, and almond trees, the produce of which is exported in large quantities. The town, which for long was a mere village, owed its origin to the founding of a large Benedictine monastery, with its church, the seat of the metropolitan archbishop of Sicily.[1] This, the greatest of all the monuments of the wealth and artistic taste of the Norman kings in northern Sicily, who in 1072 expelled the Mohammedans and established themselves there with Palermo as their capital, was begun about 1170 by William II., and in 1182 the church, dedicated to the Assumption of the Virgin Mary, was, by a bull of Pope Lucius III., elevated to the rank of a metropolitan cathedral. It was, and is even now, one of the most magnificent buildings in the world, and Pope Lucius in no way exaggerated its splendour when he said in his bull, "ut inde opus per aliquem regem factum non fuerit a diebus antiquis."

The archiepiscopal palace and monastic buildings on the south side were of great size and magnificence, and were surrounded by a massive precinct wall, crowned at intervals by twelve towers. This has been mostly rebuilt, and but little now remains except ruins of some of the towers, a great part of the monks' dormitory and frater, and the very splendid cloister, completed about 1200. This latter is well

[1] An earlier church appears to have existed at Monreale since the 6th century, but no traces of it now remain.

which are sumptuously decorated either by rich sur- rving or by bands of patterns in gold, silver, and , made of glass tesserae, arranged either spirally or lly from end to end of each shaft. The marble caps h richly carved with figures and foliage executed reat skill and wonderful fertility of invention no ing alike. At one angle, a square pillared projection contains the marble fountain or monks' lavatory, ev the work of Moslem sculptors.

The chief feature of the place - the church like th cloister, is fortunately well preserved. In plan curious mixture of Eastern and Western arrange Fig) The nave is like an Italian basilica, while th triple-apsed choir is like one of the early thre churches, of which so many examples still exist i and other Eastern countries (see De Vogüe, *Sy Arab*. It is, in fact, like two quite different chur together entered. The basilican nave is wide, with arcade Monolithic columns of Oriental granite one which is of egregious, evidently the spoil bestriding, on each side upper eight pointed arch ruled There is no triforium, but a lofty clerestor wide two-light windows, with simple tracery like th the nave arcade and throughout the church The first, Eastern in two orders, is both wider and high the nave It is not divided at the central pace w arch, each of the outer ones (at the east w pier The three woodwo low in pitch, constructionally poor, but richly de with colour now mostly restored At the we the nave are two prodigious towers, with a three-s between them A large open atrium which once at the west, is now completely destroyed The ou the church is plain, except the arcade wall and three apses, which are decorated with interlacing pointed and other ornaments mosaic on marble The ou the principal doorways and their pointed arches are recently enriched with carving and inlay, a curious combination of three styles Norman French, Byzantin Arab.

It is, however, the enormous extent (80,630 squa and glittering splendour of the glass mosaics cover interior, which make the church so marvellously (see Mosaics) With the exception of a high dado very beautiful marble slabs enriched with b mosaic, the whole interior surface of the wall, in soffits and jambs of all the arches, is covered with mosaic pictures on brilliant golden or gold ground gorgeous method of decoration takes the place of all architectural details, such as mouldings and pa The mosaics cover even the edges of the arches and which are lightly rounded off, so as to allow them covered by the glass to curve This device gives a softness to all the edges, and greatly enhances the effect produced by the gleaming gold ground. only exception made is on the sculptured caps of th arcades, mostly Corinthian in style The mosaic are arranged in tiers divided by horizontal and band of elaborate flowing mosaic ornament. In the choir there are five of these tiers of subjects figures one above another. The half dome of the apse has a colossal half-length figure of Christ, crowned Virgin and Child below the other apses ha ten standing figures of St Peter and St Paul tion on each picture explains the subject or sain scroll the figures are in Latin, except some few wh mosaic The subjects are partly from the Old most from the Christ-cycle His scheme of redemptio gure of those who prophesied and prepared f among Towards the east are subjects from th Testament, chiefly representing Christ miracles and ing, with apostles, evangelists, and other saints den, execution, and choice of subjects all appea of Byzantine origin, the subjects being selected fr *Menologium* drawn up by the emperor Basilius Po genitus in the 10th century.

No other mosaics perhaps so closely resemble th

gs as tho e over the nave columns in the Church Nativity at Bethlehem. They are alike, not only gn and treatment, but also in the curious mixture n and Greek in the inscriptions (see De Vogüe, *de la Terre Sainte*, 1860). This similarity is easily ted for by the fact that these two sets of mosaics, o far apart, were executed about the same date der the same conditions, viz., by the hands of ne artists, working for Norman French kings.

e central apse at Monreale, behind the high altar, marble throne for the archbishop. This position throne is a survival of the early basilican arrange when the apse and altar were at the west end. In the celebrant stood behind the altar at mass, and ower it eastwards towards the people. This pecu- the throne was frequently reproduced in churches like this, have the apse at the east. On the north front of the high altar, is another somewhat throne for the use of the king. The tomb of I., the founder father, a magnificent porphyry ably contemporary with the church, under a marble canopy, and the founder William II., tomb, in Dyce, were both shattered by a fire, which in oke out in the choir, injuring one of the mosaics, troying all the fine white marble cutting, the ornaments of the choir roof. The tombs were rebuilt and ole of the injured part of the choir restored very clumsily, a few years after the fire. On the of the choir are the tombs of Margaret, wife of I., and her two sons Roger and Henry, together urn containing the heart of St Louis of France, d in Dyce. The present of the triple choir, much restored, is a very magnificent specimen of and porphyry work on Cosmati Alexandrinum, with Arabic influence in the main lines.

bronze doors, three on the north and west of the are of great interest in the history of art. They h divided into a number of square panels with sub- d single figures, mostly from Bible history, cast in That on the north is by Barisano of Trani in Italy, and is dated probably of Greek origin. It is SUM BARISANVS DE TRANI ME FECIT. The cathedral at and Ravello also have doors by the same r. The west bronze door at Monreale, similar to this one both in its line of design and in workmanship, ornaments of Christ on the cathedral of which place the Latin style. The bronze doors on the north, opposite

Scottish cavaliers descended from Hector Monroe, an of Charles I. At the outbreak of the Revolutionar James Monroe was a student at the College of Willia Mary, but left his studies in 1776 to join the cont army. He took part as lieutenant in the New campaign of that year, and was wounded at the ba Trenton. The next year he served with the rank of on the staff of General William Alexander ("Lord Stir but, thus being out of the line of promotion, he soon himself without military employment. In 1780 he the study of the law under the direction of Jefferso governor of Virginia. His intimacy with Jefferson time had probably a controlling influence upon his quent political career. He continued through all vicis to possess the friendship and support of both Jeffers Madison.

In 1782 Monroe was in the State legislature, an 1783 to 1786 was a member of Congress. On r from Congress he entered upon the practice of the Fredericksburg, and was again elected to the legis In the Virginia convention of 1788 for the ratifica the constitution, he was among the opponents o instrument; but his course was approved by the ture of his State, who elected him United States in 1790 to fill the vacancy caused by the death of W Grayson. A senator he was a decided opponent Federalist administration. Nevertheless he was s by Washington in 1794 as minister to France in p Gouverneur Morris, a Federalist, recalled upon the of the French Government. Being of the party wh pathized with the revolutionary struggle in France, expected that his appointment would be flattering Government of that country, and would also concili French party at home. The Government of the Nation vention received Monroe with open signs of favour, his part he expressed his own and his country's syn with the French Republic with so much enthusias Washington deemed his language not in keeping w neutral policy which the administration had recent claimed. At about the same time John Jay had neg a treaty of amity and commerce with England whic great umbrage to France. It was alleged that the treaty of 1778 with France was violated by the stipu of the Jay treaty, and the Directory seemed dispo make of this a *casus belli*. In this emergency believed by Washington and his advisers that failed to represent properly the policy of the Gover and he was therefore recalled in 1796. In justifica his diplomatic conduct, he published the next y *View*, a pamphlet of 500 pages. In 1799 he governor of Virginia, and was twice re-elected. meantime the Republican party had come into powe Jefferson as president, and Monroe was again calle to fill an important diplomatic station. He wa missioned on 10th January 1803 to act with Livi resident minister at Paris, in negotiating the purc New Orleans and the territory embracing the mo the Mississippi, which formed a part of the prov Louisiana, recently ceded by Spain to France. In the anticipated renewal of hostilities between Engla France in 1803, Napoleon was anxious, for a consid to part with his new acquisition, which in the even war with England he would probably lose by co The American commissioners met therefore wit difficulty in the accomplishment of their object. the absence of instructions, they assumed the respon of negotiating the purchase not only of New Orle of the entire territory of Louisiana – an event that is second in importance to any in the history of the c Monroe was next commissioned as minister to E

MONROE, James (1758–1831), fifth president of the States, was born 28th April 1758, in the county moreland, Virginia. According to the family on, their ancestors are traced back to a family of

ced Rufus King, who had resigned. In 1804 he
ook a mission to Madrid, with the object of
ting the purchase of the Floridas, but in this he
-ucce-sful, and returned to London in 1805. The
ar he was joined in a commission with William
y to negotiate a treaty with England to take the
ot the Jay treaty, which expired in that year
Auckland and Howick having been appointed on the
England, a treaty was concluded on the last day
year, which was perhaps more favourable to the
States than the Jay treaty, but, like the latter, it
ed no provision against the impressment of Ameri
men. For this reason President Jefferson refused
mit it to the Senate for ratification, but sent it back
-ion. In the meantime Canning had become
ecretary in place of Fox, and refused to re
e negotiation. Monroe returned to the United
in 1807, and, as in the case of his first French
, he drew up a defence of his diplomatic conduct
gland. In 1808 certain disaffected Republicans
ted to put Monroe forward as the candidate for the
ney but at Virginia election Madison
withdrew his name. In 1810 he was agreeably
-lature of his native State, and the next year re
. But in the year he was called from the state
national council, upon either Robert Smith's
y of state in Madison's cabinet, and took an
part in precipitating the war against England in
On the retirement of Armstrong, after the capture
hington in 1814, Monroe assumed the duties of the
partment in addition to those of the state depart
and by his energy and decision infused something
ew into the conduct of the war. He was elected
nt in 1816, and was re-elected in 1820 without
ion. The period of his administration (1817–25)
n called "the era of good feeling." For the moment
party issues of the past were mostly dead and
ues had not yet arisen. In the formation of
inet Monroe showed the soundness of his prefe
selecting for the leading position J. Q. Adams
alhoun, W. H. Crawford, and William Wirt. With
ble advisers he devoted himself to the economic
opment of the country, which had been so long
ed by foreign complications. As president, more
e was able to accomplish in 1819 the acquisi
the Floridas, which as minister to Spain he had
o do in 1804, and to define the boundary of Louis
hich he had been the agent in purchasing in 1803.
onroe is best known to later generations as the
of the so-called "Monroe doctrine," a declaration
d in his seventh annual message, 2d December 1823,
the formulation of the sentiment, then beginning
ad, that America was for Americans. One of the
les of the neutral policy of the country, which had
stablished with much difficulty, had been that the
States would not interfere in European politics.
w this policy was held to include the converse as a
y corollary, that is, that Europe should not inter
American politics, whether in North America or South
a. The occasion of proclaiming this doctrine was
noured intervention of the Holy Alliance to aid Spain
reconquest of her American colonies. President
believed that such a policy entered upon by the
ontinental powers of Europe would be dangerous
peace and safety of the United States, he therefore
d that "we would not view any intervention for
rpose of oppressing them (the Spanish American
or controlling in any manner their destiny, by any
an power, in any other light than as the manifesta
f an unfriendly disposition towards the United
States." The declaration, together with the known
tility of England to such a project, was sufficient to
further action on the part of the Alliance.

On the expiration of his presidential term Mon
tired to Oak Hill, his residence in Loudoun county
ginia; but at the time of his death, 4th July 1831,
e was living in New York. He was married about 1
left two daughters. He was a man of considerable cha
and, though not possessing ability of the first or
rank high as a wise and prudent statesman. H
has been written by D. C. Gilman (q.v.).

MONROE, a city of the United States, county
Monroe county, Michigan, lie 32 miles south-sout
of Detroit, on both banks of the Raisin river, 3
inland from Lake Erie, with which it has been con
by a ship-canal since 1843. It is a station on the C
Southern, the Ann Arbor and Pere Marquette, and the
division of the Lake Shore and Michigan Southern
ways. A technical supplement to the "Polytechnic"
factory, foundries, and one or two woollen mills, paper mills, and flour mills are
ocation. From 100 to 500 tons of grape are
ds from the neighbouring vineyards, and over 5
allons of wine are made here. The population
as 19,29. Settled a Frenchtown by a body of C
n 1784, Monroe received its present name, in hon

1837. It was the scene of the battle of the river
23d January 1813.

MONROVIA. See LIBERIA, vol. xiv. p. 505.

MONS, a town of Belgium, the capital of the p
of Hainault, on the river Haine and Trouille, a
mile south-west of Brussels. The population in 18
was 26,606. Mons is divided by the river Trouille i
upper and lower town, the best built and most pic
the happy combination of the ancient fortifications
plantations has helped to connect the two. The place is p
and elevated on a spur between broad well-wooded
and broad open spaces. The fortifications, once amo
strongest of the Continental fortresses, have quite recently been
their site being now occupied by an exterior zone
boulevard. Among the monuments worthy of n
are the church of St Waudru, one of the best ty
ourneal architecture to be found in Belgium, the
of St Elizabeth, a combination of the Gothic sty
the Corinthian, the town-hall erected in 1458, a
belfry tower, next to which formerly rose the old
of the count of Hainault, the demolition of whi
a few years ago led to the discovery of some curious
paintings, believed to be of the 15th century. Mons po
a public museum and a school of engineering and a
brary of importance. The administration of la
government for the province is concentrated the
Mons manufactures of cotton, velvet, cloth
arge, and clay pipes; it has tanneries, fan vari
ks, vats, and a market of some note for a
produce, cattle, horses, and tobacco. The main
the wealth and prosperity of Mons is derived fr
collieries, which extend under the streets and yield an
between two and three million tons of coal, the
greater part of which is carried into France, in the
district to the south-west of the town at the large and mo
collieries of Jemmappes, Quaregnon, Frameries, Pat
Wasmes, and Flénu, each with a population of from
twelve thousand inhabitants, the closest to, together
more other somewhat less populous, forming an aggrega
called the Borinage, rich in coal mines, in iron found
stone and marble quarries, and may be considered
of the busiest centres in the world.

Mons is built on the site of a Roman camp erected b

nd afterward occupied by a brother of Cicero, who was
thence by Ambiorix, chief of the Eburones. In the 8th cen-
ry it bore the name of Waudru or Waltrud countess of Hain-
nted round it, which became the centre of the town. In
ion it made it the capital of the county of Hainault, a
ion in 1115. Baldwin VI., afterward Latin emperor of
was very active the interest of Mons,
ed it with considerable liberties in the year 1200. After
stroyed by a party one night by the plague. Mons received

OCEAN.

STER. Monsters or monstrous births are the sub
Animal Teratology, a department of morphological
treating of deviation from the normal development
embryo. The term "embryo" is conventionally
in human anatomy to the young in the first three
of its intrauterine existence, while it will develop
acquiring the rudiment of its form, the term
being applied to it in the subsequent months during
the organism grows on the line of development
laid down. It is mostly in the first or embryonic
that those deviations from the normal course which
themselves as monstrosities at the time of birth,
only traces of deviations which the embryo may be
but they grow with it, grow and strengthen with
gth, until they amount to irreparable defects or
ons often incompatible with extrauterine life. The
of teratology was introduced by Etienne Geoffroy St
(1832), who derived some *types*, the equivalent of
ous, terminology which seems now on the point to have been
ed in accordance with the Latin word *teras*, a monster
of superstitious ideas connected with it. The myths of
satyrs, fauns, centaurs, and the like, with the corresponding
ling figures in Northern mythology, find a remote
ical basis in monstrous births which have, for the most
o life except in the foetal state. The myth of giants
and dwarfs is, of course, better founded. The term
was originally used in the same sense as by Pliny
(*H. Nat.*, vii. 2), who says: *Monstra sunt, partus ponendi prodigii
causa, quorum conformatio, excedunt, aut vitio deest, aut amplius est
aut*. Luther speaks of the birth of a monstrous
evidently the subject of contemporary talk, a portent
a great impending change, and he expresses the hope
the catastrophe might be the Last Day itself. The
more scientific view will be sketched at the close

arch more to the [illegible] human species and
[illegible] repeat certain definite type of
on development, they do not fall readily into classes
mented by Vrolik, that a scientific classification is
ticable to-day is too premature, and that a com
nt grouping is all that need be attempted. The
usual grouping, originally suggested by Buffon, 1699)
monstra per excessum, monstra per defectum, and
per fabricam alienam. It seems natural, however,
e the more simple cases of excess and of defect side
e, and it is necessary, above all, to separate the
monsters from the single, the theory of the former
a distinct chapter in teratology.

I. *Monstrosities in a Single Body.*—The abnorm
may extend to the body throughout, as in well-proporti
gantism and dwarfs; or it may affect a certain regio
member, as to take the simplest case, when there
finger or toe too many or too few. It is very com
for one malformation to be correlated with several oth
as in the extreme case of acardiac monsters, in which
non-development of the heart is associated with the
development of the head, and with other radical defe

Giants are conventionally limited to persons ov
feet in height. The normal proportions of the fr
are adhered to more or less closely, except in the s
which is relatively small, but accurate measurem
even in the best proportioned cases, prove, when red
to a scale, that other parts beside the skull, not
the thigh-bone and the foot, may be undersized the
overgrown.[2] In persons who are merely very tall, the g
stature depends often on the inordinate length of the l
limbs, but in persons over 7 feet the lower limbs are
markedly disproportionate. In many cases the mu
and viscera are not sufficient for the overgrown frame
the individuals are usually, but not always, of fe
intelligence and languid disposition, and short l
The brain-case undersized the Irish g
the museum of Trinity College, Dublin, is the s
ception to the rule, but the bones of the face,
pecially the lower jaw, are on a large scale. G
are never born of gigantic parents; in fact, ste
rally goes with this monstrosity. Their size is s
times observed at birth, but more often the indicatio
great stature do not appear till later, it may be as la
the ninth year, they attain their full height before
twenty-first year. They have been more frequently
than female, the German giantess lately exhibited (1
was as tall as any authentic case in the male sex.

Dwarfs are conventionally limited to persons unc
feet. They are more likely than giants to have the n
h of the body perfect. "In the true dwarf, as far
have been able to ascertain, the proportions betwee
several parts of the frame are good, correspondin
nearly correspondence with those of the normal adult
the diminutive stature depends, accordingly, not upo
latively, imperfect growth of any particular segmen
even upon the permanence of a foetal or childlike
dition, but upon the whole frame being unders
(Humphry). Where disproportion occurs in the
dwarf it takes the form of a large-sized head,
boulder- and capacious chest, and undersized lower
Dwarfs with rickets are perhaps to be distinguished
true dwarfs, these are cases in which the spine is cu
and sometimes the bones of the limbs bent an
pelvis deformed. As in the case of giants, dwarf
seldom the progeny of dwarfs, who are, in fact, u
terate, the unnatural smallness may be obvious at
but is more likely to make itself manifest in the ye
growth. Dwarfs are much more easily brought up
giants, and are stronger and longer-lived; they
usually also strong passions and acute intelligence,
beyond of the dwarfs and giants are on the whol
based on fact (see DWARF and GIANT).

Redundancy and Defect in Single Parts.—The sim
case of this redundancy is a sixth digit, well forme
provided with muscles (or tendons), nerves, and
vessels like the others; it is usually a repetition of th
finger or toe, and it may be present on one or both
or on one or both feet, or in all four extremities, as
giant of Gath. The want of one, two, or more dig
hand or foot, or on both, is another simple anomaly

a passage quoted by Bischoff from the 19th volume of Luther's
Halle ed., p. 2416.

[2] See the tables in Humphry's *Treatise on the Human Skeleton*,

like the redundancy, it is apt to repeat itself in the same family. Meckel saw a girl who had an extra digit on each extremity, while a sister wanted four of the fingers of one hand. Where the supernumerary digits are more than one on each extremity, the whole set are apt to be rudimentary or stunted; they look as if two or more of the embryonic buds had been subject to cleavage down the middle, and to arrest of longitudinal growth. There are two or three authentic instances of a whole lower limb appearing at birth as two withered halves, as from embryonic cleavage.[1] Other redundancies of the skeleton are extra vertebrae (sometimes the coccygeal, giving the appearance of a rudimentary tail), or an extra rib. A double row of teeth is occasionally met with; the most interesting case of this anomaly is that in which the rudiments of a double row exist from the first, but the phenomenon is sometimes produced by the milk teeth persisting along with the second set. One or more extra teeth are occasionally met with in line with the rest. Among redundancies of the soft parts, by far the most frequent is an extra nipple, or pair of nipples. It may be the nipple, or the most external mechanical element of the mammary apparatus, that is repeated; and very often in such cases, however, the breast structure itself. The nipple, although not the latest addition to the mechanism of locomotion, nor to the individual mammal developed on the knee before the gland is formed underneath, and that faculty which appears to the development of external characters specially supposed to be the reason why there may be one or more extra nipples but no redundant gland. In the human species, it is interesting to observe that the supernumerary nipple has been shown by statistics on a large scale to be twice as common in men as in women although in the latter the mammary function never comes to maturity, and even the structure retrogrades after puberty. Traces of an additional nipple, or pair of them, in more or less symmetrical position below the normal ones are not very uncommon when carefully looked for. Among the sense organs there is a remarkable instance recorded of doubling of the appendages of the left eye, but not of the eyeball itself, the left half of the frontal bone is double, making two eye sockets on that side, and the extra orbit has an eyebrow and eyelid. The external ear (*pinna*) has also been found double on one side. Doubling of any of the internal organs is extremely rare, and is probably always traceable to a more or less complete fissuring or lobation. The duct or vessel connected with organs, and playing a purely mechanical part, are not unfrequently doubled; thus each kidney may have two ureters, and a similar variation may occur in vein and arteries.

Monstrosities from Defective Closure in the Middle Line. Under this head come some of the commonest congenital malformations, including slight deficiencies such as hare-lip, and serious defects such as a gap in the crown of the head with absence of the brain. The embryo is originally a circular flattened disc spread out on one pole of the yolk, and it is formed into a cylindrical body (with four appendages) by the free margins of the disc, or rather its ventral laminae, folding inwards to meet in the middle line and so close in the pelvic, abdominal, thoracic, pharyngeal, and oral cavities. Meanwhile, and indeed rather earlier, two longitudinal parallel ridges on the top or along the back of the disc have grown up and united in the middle line to form the second barrel of the body—the neural canal—of small and uniform width in the lower three-fourths or spinal region, but expanding into a wide chamber for the brain. This division into neural (dorsal) and hæmal (ventral) canals underlies all vertebrate development. Imperfect closure along either of those embryonic lines of junction may produce various degrees of monstrosity. The simplest common form, hardly to be reckoned in the present category, is hare-lip with or without cleft palate, which arises from defective closure of the ventral laminae at their upper end. Another simple form, but of much more import, is a gap left in the neural canal at its lower end. Usually the arches of the lumbar vertebrae are defective, and the fluid that surrounds the spinal cord bulges its membranes, producing a soft tumour under the skin of the lower part of the back. This is the condition known as *hydrorachitis*, depending on the same defect known as *spina bifida*. Children born with this defect are rare to rear, and are very likely to die in a few days or weeks. More rarely the gap in the arches of the vertebrae is in front of the neck. If it extend all along the back it probably involve the knit also. Deficiency of the bones of the head, and in the spinal axis, may be not incompatible to want of formative power to close the skin in the middle line, or even distended condition of the cerebro-spinal canal and water-pace of the cord and brain prevent the closure of the bones, and ultimately the disruption of the nervous organs themselves separates the mother, with inflammation of the membranes and its appendages may be the more immediate cause. But it is defect in the middle line that the monstrosity itself and it is on that anatomical category the malformation are included. The occurrence at the crown of the head is usually accompanied by the gaping wide open of the brain and membranes; more of the cases may be well described and the remainder, except those the exposed nerve forms a blood-clot. But there are common horizontal lines the orbits with the bones, and the skin of the forehead on to a large kind of face so that occipital and floor of the cranium. This is the very form of an *anencephalous* or brainless monster. There usually more traces of the brain, although, in rare and extreme instances the hemispheres are developed as an exposed portion on the back of the neck. The nerves are usually perfect with the exception of the optic and retinæ. Vegetative existence is possible, and a brainless monster has been known to survive sixty-five days. The child is usually a very small one.

Closely allied to, we have seen, to the anencephalous condition is the condition of *spina bifida*. The nervous system at its beginning is a neural canal, not only a tube of bony covering, but in its interior a wide space lined by ciliated epithelium and filled with water extends along the axis of the spinal cord, and expands into a series of water-chambers in the brain. As development proceeds, the walls thicken at the expense of the interior of the space, the original tubular or chambered plan of the central nervous system is departed from, and those organs assume the practically solid form in which we familiarly know them. It, however, the watery part in their embryonic proportions notwithstanding the increase of the nervous substance forming the walls, the adult encephalon brain which is more than half occupied inside with water, contained in spaces which communicate on the whole to the ventricles of the brain, and normally bounded. A hydrocephalic foetus may survive its birth, and will be more apt to be affected in nutrition than in its intelligence. In many cases the hydrocephalic condition does not come on till after the child is born. The *macrocephalous* condition, which is not a part of cretinism, is not usually a congenital one in the strict sense, but more often a consequence

remarkable case of the kind is the cyclops monster. At a point corresponding to the root of the nose there is found a single orbital cavity, sometimes of small size and with no eyeball in it, at other time of the usual size of the orbit and containing an eyeball more or less complete. In all other cases, which indicate the nature of the anomaly, the orbital cavity extends for some distance on each side of the middle line, and contains two eyeballs lying close together. The usual nose is wanting, but above the single orbital cavity there is often a nasal process on the forehead, with which nasal bones may be articulated, and cartilages joined to the latter, these form the framework of a short fleshy protuberance like a small proboscis. The lower jaw is sometimes wanting in cyclopeans; the cheek bones are apt to be small, and the mouth a small rounded hole, or altogether absent, the rest of the body may be well developed. The key to the cyclopean condition is found in the state of the brain. The olfactory nerves or lobes are usually described as absent, although Vrolik has found them in some instances; the brain is very imperfectly divided into hemispheres, and appears, as a somewhat pear-shaped sac with thick walls, the longitudinal partition of dura mater (falx cerebri) being wanting, the surface almost unconvoluted, the corpus callosum deficient, the basal ganglia rudimentary or fused. The optic chiasma and nerves are usually replaced by a single nasal nerve, but sometimes the chiasma and pair of nerves are present. The origin of the monstrosity dates back to an early period of development, to the time when the future hemispheres were being formed as protrusions from the anterior cerebral vesicle or fore brain; it may be conceived that, instead of two distinct buds from that vesicle, there was a single outgrowth with imperfect traces of cleavage. That initial defect would carry with it naturally the undivided state of the cerebrum, and with the latter there would be the absence of olfactory lobes and of a nose, and a single eyeball placed where the nose should have been. A cyclops has been known to live for several days. The monstrosity is not uncommon among the domestic animals, and is especially frequent in the pig. There is another congenital malformation, in which an eyeball is wanting from one of the sockets, but in that case there is no defect of development in the bones, and the brain and nose are normal.

Another curious result of defective separation of symmetrical parts is the siren form of foetus, in which the lower limbs occur as a single tapering prolongation of the trunk like the hinder part of a dolphin, at the end of which a foot (or both feet) may or may not be visible. The defects in the bones underlying this siren form are very various: in some cases there is only one limb (thigh and leg bones) in the middle line, in others all the bones of each limb are present in more or less rudimentary condition, but adhering at prominent points of the adjacent surfaces. The pelvis and pelvic viscera share in the abnormality. A much more common and harmless case of unseparated symmetrical parts is where the hand or foot has two, three or more digits fused together. This syndactylous anomaly runs in families.

Limbs Absent or Stunted.—Allied to these fused or unseparated states of the extremities, or of parts of them, are the class of deformities in which whole limbs are absent, or represented only by stumps. The trunk (and head) may be well formed, and the individual healthy; all four extremities may be reduced to short stumps either wanting hands and feet entirely, or with the latter fairly well developed; or the legs only may be rudimentary or wanting, or the arms only, or one extremity only. Although some of these cases doubtless depend upon aberrant or deficient formative power in the particular direc-

ns, there are others of them referable to the effect of chanical pressure, and even to direct amputation of ts within the uterus.

Acardiac and Acranial Monsters. It sometimes happens a twin pregnancy that one of the embryos fails to velop a heart and a complete vascular system of its n, depending for its nourishment upon blood derived m the placenta of its well-formed twin by means of its bilical vessels. It grows into a more or less shapeless ss, in which all traces of the human form may be lost ner viscera besides the heart will be wanting and head distinguishable; the most likely part to keep line of development are the lumbar region (with the neys), the pelvis, and the lower limbs. The twin of s monster may be a healthy infant.

Reversed Position of the Viscera. This is a developental error depending on the retention of the right ventricle as in bird, instead of the left as in mammal, position of all the unsymmetrical viscera (stomach, spleen and cardiac end of the stomach going to the ht side, the liver to the left, the cæcum resting on the iliac fossa, and the sigmoid flexure of the colon being ached to the right. This condition of *situs inversus viscerum* need cause no inconvenience, and it well probably main undetected until the occasion should arise for a sical diagnosis or *post mortem* inspection. There are nerous other anomalies in the development of the great sels. In the heart itself there may be an imperfect tum ventriculorum, and there is more frequently a ency of the fœtal communication between the pulmonary mitting the venous blood to pass into the arterial tem, and producing the livid appearance of the face wn as *cyanosis*.

The causes of congenital anomalies are difficult to specify. re is no doubt that, in some cases, they are present in sperm or germ of the parent, the same anomalies ur in several children of a family, and it has been nd possible, through a variation of the circumstances, trace the influence in some cases to the father alone, in other cases to the mother alone. The remarkable g in this parental influence is that the malformation the child may not have been manifested in the body of er parent, or in the grandparent. More often the formation is acquired by the embryo and fœtus in the se of development and growth, either through the ther or in itself independently. Maternal impressing pregnancy have often been alleged as a cause, and s causation has been discussed at great length by the t authorities. The general opinion seems to be that it mpossible to set aside the influence of subjective states he mother altogether. The doctrine of maternal impress has often been resorted to when any other explanation was either difficult or inconvenient, thus Hippocrates aid to have saved the virtue of a woman who gave h to a black child by pointing out that there was ture of a negro on the wall of her chamber. Injuries the mother during pregnancy have been unquestionably the cause of certain malformations, especially of genital hydrocephalus. The embryo itself and its mbranes may become the subject of inflammation, ophies, hypertrophies, and the like; this causation, which Otto traced all malformations of the fœtus, is doubtless accountable for a good many of them. But a y large residue of malformations must still be referred no more definite cause than the erratic spontaneity of embryonic cells and cell-groups. The *nisus formativus* the fertilized ovum is always made subject to morphological laws, but, just as in extra uterine life, there may deviations from the beaten track; and even a slight iation at an early stage will carry with it far-reaching consequences. This is particularly noticeable in monsters.

2. *Double Monsters.* Twins are the physiological of double monsters, and some of the latter have come near to being two separate individuals. Triple [illegible] are too rare to dwell upon, but their analogy with triplets. The Siamese twins, who died in 1874 at age of sixty, were joined only by a thick fleshy band from the lower end of the breast bone (xiphoid cartilage) having the common navel on its lower border, the [illegible] examination showed, however, that a process of tone must extended through the ligament from one abdominal cavity to the other, and that the blood vessels of the liver were in free communication across the same. There are one or two cases on record in which such a ligament has been cut at birth, one, at least, of the twins surviving. From the most intelligible forms of common heredity, like the Siamese twins, there are all gradations to the union of two individuals into one, the truly marvellous condition of a small body or limb parasitic upon a well-grown infant (the condition known as *fœtus in fœtu*). The former two are deviations from the normal limit of twin gestation, but from a strictly physiological point of development. In by far the majority of cases twins have separate uterine appendages and have probably been developed from distinct ova; in a small proportion of recorded cases there is evidence in the placental and enclosing structures that they had been developed from two rudiments in the same ovum (dichorial monochorial twins). It is to the latter physiological category that double monsters almost certainly belong, and there is some direct embryological evidence for this opinion. Allen Thomson observed in the blastoderm of the fowl at the sixteenth or eighteenth hour of incubation two primitive traces—or rudiments of the body—which were made by side, and in a goose egg accurately five days incubated found on one blastoderm two embryos, each with the rudiments of upper and lower extremities, across one another in the region of the future neck, and with only one head between them. Somewhat similar observations have been previously published (one case in rabbit) by Wolff, Von Baer and Reichert. Malformations in the earliest stages of blastoderm have been more frequently observed, especially in the ova of the pike, and these point to a symmetrical doubling of the primitive trace, the irregular budding from the margin of the germinal disc may give the perfect physiological type appears to be [illegible] rudiment on one blastoderm, whose entirely symmetrical development produces twin embryos, the [illegible] whose nearly separate development produces such monsters as the Siamese twins, and whose less complete development produces the various grotesque forms of individuals in one body. There can be no question of the literal fusion of two embryos either the individuality of each was at the time complete, or, if there were but one primitive trace, the unnatural type was approximately reverted to in the process of development, as in the case of the abdominal and thoracic viscera, limbs, pelvis or head. Double monsters are divided in the first instance into two classes according as symmetrical and corresponding parts are doubled, or in which a malformed body or limb is attached to or enclosed in a form of more perfect development, the latter class being the so-called "parasitic."

Symmetrical Double Monsters are also named according to the part or region of the body where the union or duplicity exists—head, thorax, umbilicus, or pelvis. One of the simplest cases is a Janus head upon a single body; there may be two pairs of arms with the two faces. Again there may be one head with two necks and two complete

rs of extremities. Two distinct heads (with more
of neck) may surmount a single trunk, broad at the
rs but with only one pair of arms. The trunk,
may rise from the middle of the thorax downward,
two heads and two pairs of shoulders and arms, but
e trunk and one pair of legs. In another variety,
y may be double down to the waist, but the pelvis
s finally single. The degree of monstrosity in the region
ead, abdomen, or pelvis may be so slight as to permit
distinct organs or sets of organs in the respective
, or so great as to have the viscera in common, and
hardly ever an intermediate condition between these
s. Thus, in the Janus-head there may be two
s or only one brain. The Siamese twins are an instance
n at the umbilical region, with the viscera distinct
y respect except a slight vascular and tendinous
ous process of peritoneum, but it is more usual for
n that region to be more extensive and to entail a
ct of abdominal and thoracic viscera. The pelvis
of the commoner forms of double monsters to

ed at, and, as in the head and abdomen, the
n may be slight or total. The Hungarian sisters
and Judith (1701–57) were joined at the sacrum,
d the pelvic cavity and pelvic organs, the
ondition obtained in the South Carolina negroes
and Christina, known as the "two-headed Negress,"
and in the other recent case of the Bohemian sisters
e and Josepha. More usually the union in the
person is complete, and produces the most fantastic
of two trunks (each with head and arms) joined
at various angles and with three or four lower limbs
ing from the region of fusion, sometimes in a lateral
on, sometimes downwards. A very common kind of
monster is presented by two otherwise distinct
s joining at the crown of the head and keeping the
their bodies in a line. It is only in rare instances of
uble monsters (*vide* those with cranial and the preserved
ens of them) to meet boys of foetal size.

Congenital Double Monsters, Parasites in Foetu. There are
well-authenticated instances of the most extreme of
nalies. The most celebrated of these parasitic
g monsters was a Genoese boy, Johannes Baptista
edo, born in 1716, who was operated on as a child by
s, and again by Bartholomew at the age of twenty-
as a young man of average stature. The parasite
d to the lower end of his breastbone and was a
ly well-formed child, wanting only one leg, of
ed, kept at interval, and moved its body but it

s separate nutritive functions. The parasite is more
be a rudimentary acardiac and acephalous fœtus, as
he case of the one borne in front of the abdomen
human figured by I. Geoffroy St Hilaire. Sometimes
the parasite is contained in a pouch under the skin
abdominal wall, and in another class (of which
a specimen in the Hunterian Museum) it has
s been enfolded, by the closure of the ventral laminæ,
the abdominal cavity of the fœtus, a true *fœtus*
in fœtu. Simple parasitic tumours, containing masses
e, cartilage and other tissue are found also in the
behind the fœtal bone (medullated teratoma), or
g from the base of the skull and protruding through
outh (sphenoidal teratoma, appearing to be seated
e jaw), and, most frequently of all, attached to the
n. These last pass by a most interesting transition
common form of congenital sacral tumour (which
e of enormous size) consisting mainly of one kind
ue having its physiological type in the curious gland
ody (coccygeal gland) on which the middle sacral artery
s to an end. The congenital sacral tumours have a
ney to become cystic, and they are probably related to

the more perfect congenital cysts of the neck region,
there is another minute gland-like body of the same
at the coccygeal at the point of bifurcation of the co
carotid artery. Other tumours of the body, esp
certain of the sarcomatous class, may be regarded
the point of view of *monstra per excessum*; but such

MONSTRELET, ENGUERRAND DE (*ob.* 1453), a chronicler whose fame, rather owing to accident than to merit, held, until the present century, the same position as chron
French affairs during the early part of the 15th
as Froissart deservedly holds with regard to the l
of the 14th), was born at an uncertain date, app
not later than 1400, and died in July 1453. He

noble family in the district of Boulogne. He held m 36, and later, the office of lieutenant gavenier (receiver the *gave*, a kind of church rate) in the city of Cambray, l seems to have usually resided there. Besides this he s for some time bailiff of the chapter of that city, and er provost. He was married, and left children. But s almost exhausts the amount of our knowledge respect him, except that he was present, not at the capture of Maid of Orleans, but at her subsequent interview with duke of Burgundy. As a subject of the latter prince naturally takes the Burgundian side in history, which ends in the genuine part of it to two books, and covers e period from 1400 to 1444. At this time, another ronicler Matthieu de Coucy informs us, Monstrelet ceased iting. But, according to a habit by no means uncommon the Middle Ages, a chronicle sequel extending to a period g subsequent to his death, was formed out of various er chronicles and tacked on to his work. The genuine rt of this, dealing with the last half of the Hundred Year ar, is valuable because it contains a large number of uments, which are certainly, and reported pieces which probably, authentic. It has, however, little colour or rative merit, is dully, though clearly enough, written l is strongly tinged with the pedantry of its century most pedantic in French history. The best edition is at published for the Société de l'Histoire de France by Douet d'Arcq in 1856.

MONTAGU, Lady Mary Wortley (1690–1762), one the most brilliant letter writers of the 18th century, wa eldest daughter of Evelyn Pierrepont, duke of Kingston, d Lady Mary Fielding, daughter of the earl of Denbigh er near relationship with Fielding the novelist is worth marking. She was born at Thoresby in Nottinghamshire in 1690. Her mother died when she was a child, d by some chance she received or gave herself an unusually wide literary education, had the run of her father's brary, was encouraged in her studies by Bishop Burnet d while still a girl translated the *Enchiridion* of Epictetus. After a courtship in which she showed a singular wer of thinking for herself, she was married in 1712, ainst her father's wish, to Mr E. Wortley Montagu, accomplished and scholarly friend of the Queen Anne ts. At the new court of George I her beauty and t brought her much homage. Pope was among her ost devoted worshippers, and she even gained and kept friendship of the great duchess of Marlborough. Her sband being appointed ambassador to the Porte in 16, she accompanied him to Constantinople, and wrote her friends at home brilliant descriptions of Eastern life d scenery. These letters were not published till 1763, e year after her death, but, copies being handed about fashionable circles, their lively, witty style, graphic tures of unfamiliar life, and shrewd and daring independents gave the writer instant celebrity. In one of them e described the practice of inoculation for the smallpox d announced her intention of trying it on her own son, d of introducing it in spite of the doctors into England. he most memorable incident in her life after her return om the East was her quarrel with Pope, caused, according to her account, by her laughing at him when he paid ve to her in earnest. He satirized her under the name Sappho, and she teased him with superior ingenuity d hardly inferior wit. From 1739 to 1761 Lady Mary ved abroad, apart from her husband, maintaining an fectionate correspondence with her daughter Lady Bute, which she set forth views of life largely coloured by e asceticism of her master Epictetus, and wearing an ppearance of oddity and eccentricity from their contrast ith conventional thought. The character of coldness nd unwomanliness which Pope contrived to fasten on his enemy was far from being deserved, her letters sh to have been a very warm hearted woman, thou principle he turned the hard side to the world. died 21st August 1762. The best edition of her w that of 1861, with a memoir by Moy Thomas.

MONTAIGNE, Michel de (1533–1592), essayi born, as he himself tells us, between eleven o'clock an on 28th February 1533. The patronymic of the Mon tenancy, who derived their title from the chateau at the essayist was born and which had been bought grandfather, was Eyquem. It was believed to be o Bordeaux, and the lord-mayor of Guienne and Gra the Dutch heartily proved a welcome opportunity introduction of English colonists. But the elabor article of M. Malvezin have proved the existence family of Eyquem or Aymem before the marria Eleanor of Aquitaine to Henry II. of England, no connexion between this family, who were Sh Eyquems, and the essayist's ancestors can be mad Montaigne's property lay from Bordeaux, and in Mont time was in the province of Périgord. It is n the arrondissement of Bergerac and the departm Dordogne. The Eyquem family had for some time connected with Bordeaux. It had though they pu more than one estate in were of tul and certain's very recent nobility. Pierre E Montaigne's father had been engaged in comm herring merchant at Scarborough had filled municipal office in Bordeaux, and had served Francis I. in Italy as a soldier. The essayist w the eldest son but the third. By the death elder brother, however, he became head of the He had also a younger brother and sister. His appear, like many other men of the time, to have a hobby of education. Michel was not a prom indeed he was all his life a valetudinarian, and th have especially prompted his father to take pain him. At a time when the advice to universal ment of children was almost entirely pa Montaigne. He was, according to the French common at all times, put out to nurse with a woman. But before Eyquem could settle the y fancy of choosing his own spouse from the sam and of accustoming him to associate with p taught Latin first by one who could speak no and many other tricks were tried on him, instance they of which have come down to mo Pur he was by no means at all wood to be able V teaching here broke out more out of the comm than by. Later comes by some kind of mec arrangement not very intelligible, and was qu cancelled. The details of his education (whi most of the that is known about him come from h mouth) are not only interesting in themselves but the reader how not to do it at the same time, th create a taste for French during the Renaissance v exercising him (though not to be exercised, in ode more ancient and better). At six year old father (returning very in education do not seem disputed here) at the extremely early age at w was then usual to begin school training) Montai sent to the College de Guienne at Bordeaux, then height of its reputation, having more than doz number of scholars (two thousand) that even the English public school has usually boasted. Am masters were Buchanan, Muret and the teacher o L. and Muretus, one of the first scholars of the age, with their colleague Guérente, composed Latin p their pupils to act, and are held to have given t impulse to the production of the classical French

The fiercest period of the religious ... save that yet to come of the League, passed over him ... without harming him, though not without subjecting ... some risk. But his health grew worse and worse, ... was tormented by stone and gravel. He accordingly ... resolved to journey to the baths of Lucca. Late in the ... century a journal was found in the chateau of Montaigne ... containing an account of this journey, and it was published ... first part of it is written in Italian and part of it ... in French, the latter being for the most part the ... of a secretary or servant. Whatever may be the literary ... value of this work, which has rarely been read ... with the *Essays* themselves, it is almost entirely devoid ... of literary interest. Written, moreover, according to ... own showing merely for the author's own eye, it contains ... abundance of details as to the mediæval effect of ... various baths which he visited, details which may prove ... to be superfluous to a medical reader, and disgusting to ... any other. The course of the journey was first ... north to Plombières, then by Basel to Augsburg, ... Munich, then through Tyrol to Verona and Padua in ... Montaigne visited most of the famous cities of the ... and centres, staying five months at Rome, and ... establishing himself at the baths of Lucca for no ... long a time. There he received news of his election ... mayor of Bordeaux, and after some time journeyed ... wards. The tour contains much minute information ... roads, food, travelling, &c., but the singular condition ... which it exists, and the absence of a really good

n hitherto, make it rather difficult to use it as a
nent. The freak of writing part of it in a strange
talian is not uncharacteristic of Montaigne, but the
s of his last and best editors, MM Courbet and
r, who speak of the letters as "l'unique complément
ssais," seem to indicate that they are not of those
accept the published *Voyage* as authentic. Of the
f the journey there is no doubt whatever
ontaigne (as was not unnatural in a man of his tempera-
, who had for some years, if not for the greater part
s life, lived solely to please himself) was not altogether
hted at his election to the mayoralty, which promised
wo years of responsible if not very hard work. The
ory of his father, however, and the commands of the
which seem to have been expressed in a manner rather
ger than a mere formal confirmation, induced him to
t it; and he seems to have discharged it neither better
worse than an average magistrate. Indeed, he gave
ient satisfaction to the citizens to be re-elected at the
of his term, and it may be suspected that the honour
e position, which was really one of considerable dignity
importance, was not altogether indifferent to him.
rtunately, it cannot be said that nothing in his office
ne him like the leaving of it, for it was at the close
s second tenure that he gave the only sign of the
oralizing effect which is sometimes alleged by severe
lists to come of the half epicurean, half-sceptical philoso-
y which he undoubtedly professed. It was his business,
t exactly his duty, to preside at the formal election of
ccessor, the maréchal de Matignon; but there was a
e pestilence in Bordeaux, and Montaigne wrote to the
s of that town, in one of the new undoubtedly authentic
rs which we possess, to the effect that he will leave
to judge whether his presence at the election is so
ssary as to make it worth his while to expose himself
e danger of going into the town in its then condition,
ich is specially dangerous for men coming from a good
s he does." That is to say, the chief magistrate of one
e greatest towns in France not only declined to visit
ause of sickness prevailing there, but had left it to
nt a time when nearly half the population perished,
when, according to the manners of the age, civil dis-
ance was almost sure to follow accordingly. Attempts
been made to justify Montaigne, and it may be at
said that he at no time pretended to unselfish heroism;
t is to be feared that the facts and the inference drawn
then admit of no dispute. At the least, Montaigne's
net must be allowed to contrast very little to his
ntaigne with that of Rotrou in the next century under
what similar circumstances though in a position of
less responsibility. It may, however, be urged in
taigne's favour that the general circumstances of the
, where they did not produce reckless and foolhardy
g, almost necessarily produced a somewhat excessive
on. The League was on the point of attaining its
est power; the extreme Calvinist and Navarrese party,
e other side, was (as may be seen in Agrippa d'Aubigné)
ss fanatical than the League itself, and the salvation
rance seemed to lie in the third party of *politiques*, or
mers, to which Montaigne belonged. The capital
o of this party was that of the Scotch saying, "Ilonl
let the jaw gang by," and the continual habit of parry-
and avoiding political dangers might be apt to extend
to dangers other than political. However this may
Montaigne had difficulty enough during this turbulent
od, all the more so from his neighbourhood to the chief
ts and possessions of Henry of Navarre. He
however, despite the occupations of his journey, his
oralty, and the pressure of civil war and pestilence,
h was not confined to the town, to continue his essay
writing, and in 1588, after a visit of some length to
the third book of the *Essays* was published, togethe
the former ones considerably revised. The new es
has been remarked, differ strikingly from the older
respect of length; there being only one which c
itself to the average of those in the first two books
whimsical unexpectedness of the titles, moreover, re
in but two of them: "Des coches" and "Des bo
They are, however, identical with the earlier ones in
and make with them a harmonious whole a book
has hardly been second in influence to any of the
world

This influence is almost equally remarkable in point of
and in point of form, according as it regards the subsequent history of
and as regards the subsequent history of literature. The latte
may be taken first. Montaigne is one of the few great writ

The efforts of the reformers were directed above all thing
and to strive to impose additional difficulties in the way o
equally at the same time that by holding out a strict
model, they assisted persons of little genius to imagin
write tolerably. During only two writers
date held their ground, and those two were Rabelais and Mont
Montaigne being of his nature more generally readable th
lars. The *Essays*, the popularity of which no academic c
could touch, thus kept before the eyes of the 17th and
teries a treasury of French in which every generation could

of their ancestors. The study of them influenced all the
se writers of France and they could not fail to be influ-
he direction which it was most important that they should
he racy phrase, the quaint and picturesque vocabulary,
neon framed constructions of Montaigne.

ld be impossible, however, for the stoutest defender of the
of form in literature to assign the chief part in Mon-
influence to style. It is the method or rather the manner
of which that style is the garment which has in reality
influence on the world. Like all writers except Shake-
ontaigne thoroughly and completely exhibits the intellec-
moral complexion of his own time. When he reached man-
French Renaissance (which was perhaps on the whole the
aracteristic example of that phenomenon, the religious
being neither in excess as it was in England and Germany,
e (as it had been in Italy) was at high water, and the turn
was beginning. Rabelais who died when Montaigne was
rly manhood, exhibits the earlier and rising spirit, though
to be completed on the poetical side. The Renaissance
ll revolt, account authority (must have), a certain sceptical
but it was not at first by any means commonly sceptical
he half-scornful, half-warning termination of *Pantagruel*,
ose confidence and delight, as of the invader of a promised
, the press of Rabelais. He rejoices in his strength, in his
h, in his freedom, in the pleasures of the flesh and the spirit.
ontaigne begins the age of disenchantment. By the time
when he began to meditate his essays in the retirement of
ry house it was tolerably certain that no golden age was
return. The Reformation had brought not peace but a
d the Calvinists were as intolerant as the Catholics. The
of learning, lost whatever its benefit, merely changed the
guise of pedantry into that of a pedantry. The
nting had multiplied rubbish as well as available matter
overy of America had brought ruin to the discovered and
nd discord to the discoverers. The horrors of a disputed
n were already thickening. The clergy were
to matter themselves more or less about the business of
and reform, but the extraordinary influence which church
e private life of the time had brought about its natural
satiety. Physical science hardly yet emancipated from occupy
ive minds, whose other means [illegible] while Bacon and Des-
d not arrive, nothing like [illegible] of politics had been
though Bodin and a few others [illegible] ing after one. A
Renaissance had partially [illegible] ipated itself with the p
nes and pleasures of life, so the later Renaissance spe
the vanity of the former—and these pleasures. Fi
cumstances which tended to [illegible] Montaigne were thus
him to optimism, to attach importance on the vanity of life
ike. But to do this there had to be added the peculiarity
n temperament. This was a decidedly complicated one,
ort of it he became in order to adopt a more positive ideal
gne's scepticism therefore is tempered by all the fact. The
ility of home he put up a rabbit on the house occupied
ring the time during his visit there, which speaks of him as a
of the new philosophy." In Rabelais mockery at the
ly this is equivalent to an assertion that Montaigne was
of Christianity. Nor is this assumption at all incorrect
borne out by the tone of his works and the reasonable
s to be drawn from them. The attitude which he assumed
both objective and critical chiefly. He does not [illegible]
ngine with it [illegible] ridicule

nized genius almost always passes into the satirist. The temper
which has been admirably defined as thinking in jest while feeling
in earnest naturally throws itself into opposition, though it may
not always take the irreconcilable form of the opposition of Swift.
Perhaps the only actual parallel to Montaigne in literature is Lamb.
There are differences between them, arising naturally enough
from differences of temperament and experience; but both agree
in their attitude—an attitude which is sceptical without being
negative, and humorist without being satirist. There is hardly any
writer in whom the human comedy appears treated with such
completeness as it is in Montaigne. There is discernible in his
essays no attempt to map out a complete plan, and then to fill
up its outlines. But in the desultory and haphazard fashion
which distinguishes him there are few parts of life on which he
does not touch. The exceptions are chiefly to be found in the
higher and more poetical strains of feeling, to which the humorist
temperament lends itself with reluctance and distrust, though it
by no means excludes them. The French disposition, by a change
which has never been sufficiently accounted for, and of which the
most accurate examination of documents fails fully to detect the
reason, had become, after being strongly idealist in the earlier Middle
Ages, absolutely positive in the later, and from this positiveness it
has never since quite freed itself. This positiveness is already notice-
able in Rabelais, it becomes more noticeable still in Montaigne. He
is always charming, but he is rarely impressive, except in a very few
passages where the sense of vanity and nothingness possesses him
with unusual strength. As a general rule, an agreeable grotesque
of the affairs of life (a grotesque which never loses hold of good
taste sufficiently to be called burlesque) occupies him. There is
kind of anticipation of the scientific spirit in the careful zeal with
which he picks up odd aspects of mankind, and comments upon
them as he places them in his museum. Such a temperament is
most pleasantly shown when it is least personal. The letter to
the Bordeaux pirates does not, as has been said, show Montaigne
in his best light, nor does another letter to his wife, in which
he condoles with her on the death of one of their children in
which must have drawn from any woman of sensibility and
a torrent of indignant tears. But when [illegible] almost offensive
immediate and private relationship become not only tole-
le but delightful in the impersonal and irresponsible relationship
of author to reader. A dozen generations of men have rejoiced in
the gentle irony with which Montaigne handles the *ludicrum hu-
manæ sortis*, in the quaint felicity of his selection of examples, and
in the real though sometimes fantastic wisdom of his comment on
his selections.

Montaigne did not very long survive the completion of
his book. His sojourn at Paris for the purpose of getting
it printed was by no means uneventful, and on his way he
stayed for some time at Blois, where he met De Thou. In
Paris itself he had a more disagreeable experience, being
for a short time committed to the Bastille by the Leaguers
as a kind of hostage, it is said, for a member of their party
who had been arrested at Rouen by Henry of Navarre.
But he was in no real danger. He was well known to
and favoured by both Catherine de' Medici and the Guises,
and was very soon released. In Paris, too, at this time he
made a whimsical but pleasant friendship. Marie le Jars
Demoiselle de Gournay, one of the most learned ladies of
the 16th and 17th centuries, had conceived such a venera-
tion for the author of the *Essays* that, though a very
young girl and connected with many noble families, she
travelled to the capital on purpose to make his acquain-
ance. He gave her the title of his "fille d'alliance"
(adopted daughter), which she bore proudly for the rest
of her long life. She lived far into the 17th century, and
became a character and something of a laughing stock to
the new generation; but her services to Montaigne's literary
memory were, as will be seen, great. Of his other friends
in these last years of his life the most important were
Etienne Pasquier and Pierre Charron. The latter, indeed,
was more than a friend, he was a disciple; and Montaigne,
just as he had constituted Mademoiselle de Gournay his
"fille d'alliance," bestowed on Charron the rather curious
compliment of desiring that he should take the arms of the
family of Montaigne. It has been thought from these two
facts, and from an expression in one of the later essays,
that the marriage of his daughter Léonore had not turned
out to his satisfaction. But family affection, except toward
his father, was by no means Montaigne's strongest point.

Not much is known of him in these later years, and indeed, despite the laborious researches of many biographers, of whom one, Dr Payen, has never been excelled in perseverie, devotion, it cannot be said that the amount of available information about Montaigne is large at any time of his life. It would seem that the essayist had returned to his old life of study and meditation and working up his *Essays*. No new ones were found after his death, but many alterations and insertions. His various maladies grew worse; yet they were not the direct cause of his death. He was attacked with quinsy, which rapidly brought about paralysis of the tongue, and he died on the 11th of September 1592, under circumstances which, as Pasquier reports them, completely disprove any intention, at least on his part, of displaying anti-Christian or anti-Catholic leanings. Feeling himself on the point of death, he summoned divers of his friends and neighbours to his chamber, had mass said before him, and endeavoured to raise himself and assume a devotional attitude at the elevation of the host, dying almost immediately afterwards. He was buried, though not till some months after his death, in a church in Bordeaux, which after some vicissitudes became the chapel of the College. During the Revolution the tomb and, as it was supposed, the coffin were transferred with much pomp to the town museum, but it was discovered that the wrong coffin had been taken, and the whole was afterwards restored to its old position. Montaigne's widow survived him, and his daughter left posterity which became merged in the noble houses of Segur and Lur Saluces. But it does not appear that any male representative of the family survived, and the chateau is not now in the possession of any descendant of it.

When Mademoiselle de Gournay heard of the death of Montaigne she undertook with her mother a visit of ceremony and condolence to the widow which had important results for literature. Madame de Montaigne gave her a copy of the edition of 1588, annotated copiously; at the same time, apparently, she bestowed another copy, also annotated by the author, on the convent of the Feuillants in Bordeaux, to which the church in which his remains lay was attached. Mademoiselle de Gournay therupon set to work to produce a new and final edition with a zeal and energy which would have done credit to any editor of any date. She herself worked with her own copy, inserting the additions, marking the alterations, and translating all the quotations. But when he had got this to press she sent the proofs to Bordeaux, where a port of some note, Pierre de Brach, revised them with the other annotated copy. The edition thus produced has with justice prevailed as standard even in preference to those which appeared in the author's lifetime. Unluckily, Mademoiselle de Gournay original does not appear to exist, and her text was said, until the appearance of MM Courbet and Royer's edition, to have been somewhat wantonly corrupted, especially in the important point of spelling. The Feuillants copy is in existence, being the only manuscript or partly manuscript authority for the text. It was edited in 1802 by Naigeon, the disciple of Diderot; but, according to later inquiries considerable liberties were taken with it. The next edition of 1635, with the various readings of two others which appeared in the author's lifetime, was reprinted by MM Decrocq and Barbauchen. Hitherto the edition of Le Clerc (3 vols., Paris, 1725) and in a more compact form that of Lefèvre (1 vol., Paris, 1826) have been the most useful. The edition, however, of MM Courbet and Royer, which is based on that of 1595, will undoubtedly be the standard; but, though the text is complete (Paris, Lemerre, 1872–1877), the fifth volume, containing the biography and all the critical apparatus, has unluckily yet (1883) to make its appearance. The editions of Montaigne in France and elsewhere, and the work done by him during the past three centuries, are innumerable. His influence upon his successors has already been hinted at, and cannot here be traced in detail. In one case, however, that of Pascal it has assumed sufficient importance to deserve mention. Pascal, who left a special discourse on Montaigne, was evidently profoundly influenced by him, and the attitude towards his teacher is an interesting one. The sceptical method of the essayist was at once tempting and terrible to him. He accepts it in so far as it demolishes the claims of human reason and heathen philosophy, but evidently dreads it in so far as it is susceptible of being turned against religion itself. In England Montaigne was early popular. It was long supposed that the autograph of Shakespeare in a copy of Florio's translation showed his study of the *Essays*. The autograph has been disputed, but divers passages, and especially one in *The Tempest*, at first or second hand the poet was acquainted with the Toward the latter end of the 17th century, Cotton the Isaac Walton, executed a complete translation, which, though extraordinarily faithful, possesses a good deal of roughness has been frequently reprinted with additions and alterations most noteworthy critical handling of the subject in English is unquestionably Emerson's in *Representative Men*.

MONTALEMBERT, CHARLES FORBES DE (1810–1870), historian was born on 29th May 1810. The family is a very ancient one, belonging to Poitou, or rather Angoumois. Direct descent is said to be provable from the 13th century, and charters and other documents exist in the history of the house two centuries further back. Several generations before the historian the family had become English, not merely in the army, but for several generations. Montalembert's father, Rene, emigrated with Conde, and subsequently served in the English army. He married a Miss Forbes, and his eldest son Charles was born at London. At the Restoration de Montalembert returned to France, was raised to the peerage in 1819, and became ambassador to Sweden (Charles received much of his education) in 1826. A year after the overthrow of the Legitimacy in 1830 Charles de Montalembert was too young to take his seat as a peer (twenty-five being the necessary age), but retained other rights, and this, combined with his ardent and intellectual activity, made him a person of importance. He had eagerly entered into the somewhat undefined plans of Lamennais and Lacordaire for the establishment of a school of Liberal Catholicism, and cooperated with them, both in the *Avenir* (see ESSAYS, vol. xiv. pp. 239, 240) and in the practical enterprise which developed some of the best energies of France at the time, to break through the trammels of the system of education. The latter scheme first brought Montalembert into notice, as he was formally charged with unlicensed teaching. He claimed the right of trial by his peers, and made a notable defence, of course with a deliberate intention of protest. His next memorable act was his participation in the famous pilgrimage to Rome of his two friends. This step, as is well known, proved a decisive turning-point in the movement which private natures, and perhaps a certain altogether ingrained loyalty of instinct, prompted the Roman Catholic to take against the Revolution and the doctrines of its professors. Montalembert, however, submitted dutifully to the papal decree of June 1834, and only devoted himself more assiduously to the work on which he was engaged, *Des Intérêts Catholiques au XIXe Siècle*. This appeared in 1836, and displayed Montalembert's constant literary characteristics, and, though not to *Le Moine d'Occident* in style and labour, a perhaps superior to it as a work. The famous speech by which Montalembert is best known was delivered in 1836, and was the first of a series of orations which, though not to be compared to those of Mirabeau, Vergniaud, or Berryer, are yet of considerable merit. Montalembert's style

d the *coup d'état* disgusted him, though he still sat chamber. A defeat in 1857 put an end to his entary appearances. He was still, however, recog- as one of the most formidable of the moderate nts of the empire, and he was repeatedly prosecuted imperialist letters and pamphlets. In the ten tween 1840 and 1850 he had written little but pamphlets, but after the establishment of the and especially after he lost his seat in the chamber, ame more prominent as an author. Even before had produced a volume on the *Avenir Politique de* (1855), and another on *De l'Avenir et Lord Palmer* 856), besides numerous articles and pamphlets, the which were perhaps *Une Nation* [Poland] *en Deuil*, *Enfin Libre dans l'Etat Libre*.

great work, the fruit of many years' labour, did not till he was fifty years old, and ten years before his which occurred before its completion. *Les Moines ent depuis St Benoît jusqu'au St Bernard* has one peculiar drawback which have characterized almost orical work of any literary pretensions during the generation. It is planned on too large a scale, ceived with too much regard to profusion of pictur- ial and abundance of fluent argument on points he writer has at heart. Its best passages are inferior best of a younger writer of very different opinions not dissimilar style and temperament. M. Lenoir , but it is a work of great interest and value.

tale Robert, who had married Mademoiselle de Merode, f one of Pius IX.'s ministers, but who had no male e, died in March 1870 the year so fatal to France. alth had long been very bad, and was understood suffered from the chagrins attending his exclusion olitical life and the defeat of most of his plans. his death his work have appeared in a complete They have, regarded from the literary point of many of the faults of their time. A voluminous and s writer, Montalembert was more of a journalist, a eteer, and an orator than of a man of letters properly d. His talents were diffused rather than concen- and they were much occupied on merely ephemeral But of picturesque eloquence in a fluent and rather nd he was no inconsiderable representative.

STALVAN, JUAN PEREZ DE (1602–1638), Spanish t and writer of fiction, was the son of the keeper, and was born at Madrid in 1602. At the early seventeen he became a licentiate in theology, and in after entering the priesthood, he received a notarial nment in connexion with the Inquisition. His ked brain succumbed under the numerous literary he imposed on it, and he died when only thirty- ld (25th June 1638).

s published eight pieces (*Sucesos y prodigios en* , one of which, "The Dramatic [illegible] has been characterized by Ticknor as one of the best anthologies. This, as well as a subsequent volume of stories, *Para Todos*, *Lo mejor de todo*, 1633, was frequently reprinted. His first prose writing was a popular panegyric ately devoted to the memory of Lope de Vega (*Fama pos- Lope de Vega*, 1635), whom he almost rivalled in dramatic ve- , and whose conventional manner, thoughtlessness in con- , and carelessness in execution he too closely followed. t volume of his collected *Comedias* appeared in 1638, the in 1639. On the Spanish stage they were in great request, talvan's reputation as a writer in some cases to borrow . His drama are distinctly superior to his "Autos sacra- ," but even of the former the tragedy *Los Amantes de* s the only one that has enjoyed permanent popularity. nor, *Hist. of Span. Lit.*, vol. iii. (1863).

NTANA, one of the north-western Territories of ited States, is limited on the N. by British Columbia, E. by Dakota, on the S. by Wyoming and Idaho, the W. by Idaho. Its boundaries, as established by statute, are as follows:—on the N., the 49th pa on the E., the 27th meridian west of Washington, 104th west of Greenwich; on the S. and W. the dary follows the 15th parallel from the 27th meridia to the 34th meridian west, then turns south alo latter meridian to its point of intersection with the ental watershed, thence along the crest-line of this shed westward and north-westward until it reach Bitter-root Mountains; it then follows the crest range north-westward to the point where it is cros the 39th meridian west, which it follows north to the British Columbia. The total area is about 146,080 miles—an approximate estimate, as the boundary al continental watershed and the Bitter-root Mounta not been exactly surveyed. The average elevation sea-level has been estimated at 3900 feet.

Topographically, Montana may be separated in great divisions—that of the plains comprising the two-thirds, and that of the mountains comprisi western portion. The former, a monotonous rolli pause, broken only by the beds of the few streams traverse it, and by a few small groups of hills, exten nine degrees of longitude in a gentle uniform slope from 2000 feet above the sea at the eastern boun 1000 at the base of the Rocky Mountains. Except al streams and upon the scattered groups of hills, this entirely devoid of forest growth of any kind. Veg is limited to the bunch grasses, artemisia, and cacti grasses are the most abundant and luxuriant n mountains, where the rainfall is greatest. The mo section, comprising the western third of the Terri composed, in general terms, of a succession of rang valleys running very uniformly somewhat in a nor and south-east direction. The mountains vary in from 8000 to 10,000, even in isolated cases re 11,000 feet, with mountain passes 6000 to 8000 feet the sea. Towards the north the ranges become continuous, forcing the streams into long and cir courses in order to disentangle themselves from th of mountains, while, on the other hand, the ranges south-western part of the Territory are much broken, ing numerous low passes and water-gaps.

In the mountainous part of the Territory are the water of the Missouri (Atlantic basin) and Clark's F the Columbia (Pacific basin). The former rises south-west of the territory in three large branch Jefferson, Madison, and Gallatin, which meet at th of the Gallatin valley at a point known as the Fork of the Missouri." Here the Missouri is a goo stream, fordable with difficulty even when the wa lowest. From this point to its mouth navigation sible when the stream is not below its mean hei is interrupted only at the Great Falls of the Missou Fort Benton, above which, however, it is practicall used for navigation. Its other principal tributaries upper course are the Sun, Teton, Marias, Musselsh Milk rivers, all of which vary much in size with the the last two being nearly or quite dry near their in the fall of the year. The Yellowstone, one of th important tributaries of the Missouri, has nearly course in Montana, and is navigable for small steam far as the Crow Agency, except when the water Clark's Fork of the Columbia is formed by the junc the Flathead and the Missoula or Hellgate river former rises in the mountains of British Columb flows nearly south through Flathead Lake to its p junction with the Missoula. The latter rises oppos Jefferson river and flows north-westward, receiving way several large affluents. Below the point of ju of these streams, Clark's Fork flows north-west al

the Bitter root Mountains into Idaho. This stream rapid, and is not navigable. Its course, as well as f most of its tributaries, passes through narrow the surrounding country being well watered and with dense forests of *Coniferæ*.

y.—Most of the mountain area belongs to the Eozoic and formations Along the base of the mountains is a Triassic variable width. Succeeding this is a broad area of nearly al Cretaceous beds, followed by the Tertiary formation, overs nearly one-third of the Territory. These recent for- are interrupted here and there by volcanic upheavals

te.—The climate of Montana differs almost as greatly a parts of the Territory as that of California. In the north resembles that of the Pacific coast The westerly wind off the Pacific do not meet with a formidable barrier as south, and consequently are not chilled, or deprived of so proportion of their moisture The result is that the north portion of Montana enjoys a mild temperature and a rainfall t for the needs of agriculture. The valleys of the Kootenai, l, Missoula, and Bitter-root can be cultivated without irri-

tion with little danger of loss from drought. Farther east an the rainfall decreases. In the valleys of the upper Misso Jefferson, Madison, Gallatin, and the upper Yellowstone ir is almost everywhere required, as well as over the broad e the plains. Over most of the Territory the rainfall ranges to 15 inches annually; in the north-western corner it rises

The general temperature is comparatively mild for the l the elevation above the sea being decidedly less than that verage of the Rocky Mountain region. The mean annual ature ranges from 40 to 50 Fahr., but the variations are ve and violent. Frosts and snow-storms are possible durin month of the year, so that agriculture and stock-raising a or less hazardous On the other hand, the ordinary extr temperature are not so great as in more arid portions of the

Forests.—Throughout the Territory, as everywhere else Cordilleran region, forests follow rainfall The plains are t the mountain valleys about the heads of the Missouri ar only with grass and artemisia, many localities extending to ideable height up the mountains, which are themselves tr though not heavily. In the north-western part, roughly a the drainage area of Clark Fork, where the rainfall i grow, the forests become of important The mountain s

Owing to the comparatively isolated position of the T agricultural pursuits have been limited by the demands consumption The census of 1880 reported the area in farm of 105,685 acres, with an average of 29·7 acres to each fa whole is less than one half per cent of the entire area of th tory The improved land is reported as amounting to acres. The following are the amounts of the principal agr products: wheat, 169,688 bushels, maize, 5689 bush

6 bushels; barley 39,970 bushels; hay, 63,947 tons; wool
4 pounds; value of all farm products, $2,024,923. The live
interest is large, and is increasing rapidly. The great extent
ture afforded by the plains and the broad valleys of the
ains would seem to promise an almost unlimited extension
s industry in the future. Both cattle and sheep owners,
r labour under disadvantages as compared with the owners
south. The lower temperature and heavier snows, and
likely the dangers of great extremes of temperature, require
provision of shelter and food be made for a part or all of the
son, otherwise the ranchman runs the risk of occasional
ss. The census of 1880 furnishes the following statistics
tock: horses, 39,111; mules and asses, 855; working oxen,
ilch cows, 11,308; other cattle, 160,113; sheep, 181,277;
10,278; total value of live stock $5,151,551.

ineral production. Montana has never taken a leading place,
h in the early days some of the placer ground yielded well
h placers of Little Prickly Pear, Bannack, and Alder Gulch
ickly exhausted. The produce of the latter has been reported
ly at from $25,000,000 to $40,000,000, the greater part of
w extracted in a few months. In the year 1879-80
76,702 worth of gold and $2,905,085 of silver were extracted,
three fourths from deep mines and one fourth from placers.
year 1882 the total mineral production is reported at
,000, of which about $1,000,000 was for copper and lead.

Industry. Owing largely to its remote position the population
the material property of Montana have had a low growth
parison with other more favoured portions of the west. The
tion in 1880, as reported to the census was 39,159 (28,174
and 10,985 females), an increase of 90 per cent over that in
There were 27,628 natives and 11,531 of foreign birth, white
re white, 546 negroes, 61 of mixed negro blood, 176 Chinese
563 civilized Indians. By far the greater portion of the popula
ound in the western half upon the head waters of the Missouri
its Fork. The eastern half is very thinly settled,
obably it will never sustain more than a small population.
Territory is divided into eleven counties, which with their
tion in 1880, were the following: Beaverhead, 2712;
n, 7926; Custer, 2510; Deer Lodge, 3769;
n, 3643; Jefferson, 2304; Lewis and Clark, 6021; Madison,
Meagher, 2733; Missoula, 2502. The principal settlement
lena the capital (3624), Butte a mining town (3363)
ecumseh in the Gallatin valley upon the Northern Pacific
y, which in 1880 had a population of 491 and has probably
that number at present (1883).

total number of lectors in Montana is reported by to
officer at 19,761. They are nominally concentrated at be
s, although in reality they are moved over the entire Territory
ge of various trades, the principal of which are the stock
Blackfoot Coal Vector, Anaconda and Point d'Orille
servations cover more than one third of the Territory.

Government and Finance. The government of Montana is similar
of the other Territories. The executive consists of a
d two secretaries appointed by the president of the
States. The treasurer, auditor, superintendent of public
ion are elected by the people of the Territory every two years. The
e of the two houses of the legislature. Montana is represented
n Congress by a delegate, also elected, who has liberty to
ert in debate but has no vote. The territorial debt of the
1881 was but $70,000. The amount raised by Territorial
e was $93,211.

History. The Montana country was originally acquired by the
States under the Louisiana purchase. It became successively
of Louisiana Territory, of Missouri Territory, of Nebraska
ry, and of Dakota. On 26th May 1864 it was erected a
Territorial government of its own with practically its present
ries. The exploration of the region commenced with the
ted expedition of Lewis and Clark in 1803–1806. Between
and 1855 it was traversed and mapped by a number of explorers,
having in view the election of a transcontinental railroad.
Since then numerous expeditions have examined it, and
systematic topographic work has been done under different
es of the United States Government. The first settlers
the Territory, in 1861, discovered placer gold on Little
Prickly Pear Creek, and shortly after built the city of Helena.
the placers at Bannack were discovered and a small "rush"
Territory commenced. In 1863 the rich placers at Alder
were brought to view, and miners and adventurers swarmed
all parts. The story is that the early social history of Cali-
was repeated on a smaller scale in Montana. The lawless
ts assumed control, and for many months neither life nor
y was safe. Indeed, for a time the community was in a
blockade, no one with money in his possession could get
the Territory. Finally, the citizens organized a "Vigilance
ttee" for self-preservation, took the offensive, and after a
harp struggle rid the community of its disturbing elements.
he exhaustion of the placers, the population decreased, owing
to the migration of the floating mining class; but their place
taken by more permanent settlers. (H

MONTANISM is a somewhat misleading name
movement in the 2d century which, along with
ticism, occupied the most critical period in the hi
the early church. It was the overthrow of Gnostic
Montanism that made the "Catholic" church. Th
of first discerning the true significance of the Mon
movement belongs to Ritschl.[1]

In this article an account will be given of the
significance of Montanism in relation to the history
church in the 2d century, followed by a sketch of its
development, and decline.

I. From the middle of the 2d century a change
to take place in the outward circumstances of Chris
The Christian faith had hitherto been maintai
a few small congregations scattered over the Rom
pire. These congregations were provided with o
most indispensable constitutional forms, neither
nor more numerous than were required by a r
bond resting on supernatural expectations, strict di
and brotherly love ("Corpus unum de consen
ligionis, de unitate disciplinæ, de spei tenore")
state of things passed away. The churches soon
members within their pale who stood in need of
vision, instruction, and regular control. The enth
for a life of holiness and separation from the
the eager outlook for the end of the world, th
surrender to the gospel message, were no long
influences by which all minds were swayed. In
of a sober convictions or submissive assent suppl
want of spontaneous enthusiasm. There were ma
did not *become*, but who *were*, and therefore re
Christians, too powerfully attracted by Christia
abandon it, and yet not powerfully enough to
adopted it for themselves. Then, in addition t
social distinctions asserted themselves amongst the
tion. Christians were already found in all ran
occupations—in the imperial palace, among the c
in the abodes of labour and the halls of learning, a
slave and freemen. Were all these to be left
callings? Should the church take the decisive st
the world, consent to its arrangements, conform
custom, acknowledge as far as possible its auth
and satisfy its requirements? Or ought she, on th
hand, to remain, as she had been at first, a soc
religious devotees, separated and shut out from th
by a rigorous discipline and working on it only t
a direct propaganda? This was the dilemma th
church had to face in the second half of the 2d c
either she must commence a world-wide mission
comprehensive sense by an effective entrance into
society—renouncing, of course, her original peculiari
exclusiveness, or, retaining these peculiarities and c
to the old modes of life, she must remain a small
heart sect, barely intelligible to one man in a th
and utterly incapable of saving and educating
That this was the question at issue ought to be
enough to us now, although it could not be clea
ceived at the time. It was natural that warning
should then be raised in the church against
tendencies, that the well-known counsels about the
tion of Christ should be held up in their literal st
before worldly Christians, that demands should be m
a restoration of the old discipline and severity, and
return to apostolic simplicity and purity. The chu
whole, however, under pressure of circumstances rath
by a spontaneous impulse, decided otherwise. She
through the open door into the Roman state, and

[1] *Entstehung der Altkatholischen Kirche*, 2d ed., Bonn,

there for a long career of activity, to Christianize the along all its thoroughfares by imparting to it the word gospel, but at the same time leaving it everything ex- its gods. On the other hand, she furnished herself with thing of value that could be taken over from the world out overstraining the elastic structure of the organiza which she now adopted. With the aid of its philosophy reated her new Christian theology; its polity furnished with the most exact constitutional forms; its juris ence, its trade and commerce, its art and industry, all taken into her service, and she contrived to borrow hints even from its religious worship. Thus we find urch in the 3d century endowed with all the resource the state and its culture had to offer, entering into relationships of life, and ready for any compromise did not affect the confession of her faith. With quipment she undertook, and carried through, a world- on on a grand scale. But what of those believers of ld school who protested in the name of the gospel st this secular church, and who wished to gather her a people prepared for their God regardless alike numbers and circumstances? Why, they joined an siastic movement which had originated amongst a circle in a remote province, and had at first a merely importance. There, in Phrygia, the cry for a tract ian life was reinforced by the belief in a new and outpouring of the Spirit, a coincidence which ha observed elsewhere in church history, as, for instance, Irvingite movement. The wish was, as usual, father thought; and thus oracles of "spiritual Christian formed, which served, especially in times of persecu as rallying points for all those, far and near, who l for the end of the world and the *excessus exercitus*, who wished in these last days to lead a holy life. zealots hailed the appearance of the Paraclete in ia, and surrendered themselves to his guidance. In ing, however, they had to withdraw from the church known as "Montanists," or "Kataphrygians," and to assume the character of a sect. Their enthusiasm their prophesyings were denounced as demoniacal, expectation of a glorious earthly kingdom of Christ stigmatized as Jewish, their passion for martyrdom inglorious, and their whole conduct as hypocritical did they escape the more serious imputation of heresy portant articles of faith: indeed, there was a disposi to put them on the same level with the Gnostics. effect on themselves was what usually follows in such nstances. After their separation from the church, became narrower and pettier in their conception of tianity. The strict rules of conduct which in a former had been the genuine issue of high strung religion on were now relied on as its source. Their asceticism nerated into legalism, their claim to a monopoly of Christianity made them arrogant. As for the popular on of the larger church, they scorned it as an adulter manipulated Christianity. But these views found little acceptance in the 3d century, and in the com e 4th they died out. Regardless of the scruples of most conscientious members, and driving the most st Christians into secession and the conventicle, the h went on to prosecute her great mission in the . And before she was able, as church of the state f the empire, to call in the aid of the civil power to ress her adversaries the Montanistic conventicles were t extinct.

Such is, in brief, the position occupied by Montanism history of the ancient church. The rise and progress movement were as follows.

the close of the reign of Antoninus Pius probably e year 156 (Epiphanius). Montanus appeared at Ardaban in Phrygia, bringing revelations of the " to Christendom. It is unnecessary to seek an expl of his appearance in the peculiarities of the P temperament. The Christian churches had alwa that prophecy was to be continued till the return of although, as a matter of fact, prophets had not bee cularly numerous. Montanus claimed to have a pr calling in the very same sense as Agabus, Judas, Si daughters of Philip, Quadratus, and Ammia, or as at Rome. At a later time, when the validity of th tanistic prophecy was called in question in the int the church, the adherents of the new movement a explicitly to a sort of prophetic succession, in whic prophets had received the same gift which the da of Philip, for example, had exercised in that very of Phrygia. The burden of the new prophecy was exacting standard of moral obligation, especiall regard to marriage, fasting, and martyrdom. But tanus had larger schemes in view. He wished to c a special community of true Christians to wait comming of their Lord. The small Phrygian to Pepuza and Tymion were selected as the headq the Jerusalem, as the prophet called them church. He spared no effort to accomplish this u believers. Funds were raised for the new organi and from these the leaders and missionaries, who have nothing to do with worldly life, drew their pay the ecstasy of the prophet did not prove so contag his preaching. Only two women, Prisca and Ma were moved by the Spirit like Montanus, they stu a state of frenzy the commands of the Spirit, whic through them sometimes as God the Father, sometim the Son, and urged men to a strict and holy life does not mean that visions and exuberant dreams have been of frequent occurrence in Montanistic But, as chosen and permanent organs of the Paracle three persons were recognized Montanus, Pris Maximilla, by their side, however, Montanus and dotus, from a very early date, played an active missionary and organizer.

For twenty years this agitation appears to hav confined to Phrygia and the neighbouring pro How could it be otherwise? To assemble the w Christendom at Pepuza was a rather impractical posal. But after the year 177 a persecution of Chr from some unexplained cause broke out simulta in many provinces of the empire. Now in the every persecution was regarded as the beginning end. It quickened the conscience, and gave more s to eschatological hope, it was a call to observe th of the time, and the intimation of God's presen would seem that before this time Montanus had disa from the scene but Maximilla, and probably al were working with redoubled energy. And now, t out the provinces of Asia Minor, in Rome, and Gaul, amidst the raging of persecution, attenti attracted to the remarkable movement. The desi sharper exercise of discipline, and a more decided re tion of the world, combined with a craving for som revelations of God's will in these last critical tim prepared many a mind for an eager acceptance tidings from Phrygia. There the Spirit, whom Chr promised to His disciples, had begun His work, t least, there were holy Christians and joyful martyr oracles of the Phrygian prophets became household in distant churches, and it was always the more minded who received them with undisguised sy And thus, within the large congregations where th so much that was open to censure in doctrine a stitution and morals, conventicles were formed m

ristians might prepare themselves by strict discipline
day of the Lord.

nwhile in Phrygia and its neighbourhood especially
tia, and also in Thrace a controversy was raging
n the adherents and the opponents of the new
y. Between 150 and 176 the authority of the
o had been immensely strengthened, and along
a settled order had been introduced into the
. It need hardly be said that, as a rule, the
were the most resolute enemies of the Montanistic
sm. It disturbed the peace and order of the con-
ns, and threatened their safety. Moreover, it
lemands on individual Christians such as very few
omply with. But the disputation which Bishops
of Cumana and Julian of Apamea arranged with
lla and her following turned out most disastrously
promoters. The "spirit" of Maximilla gained a
victory, a certain Themison in particular having
the bishops to silence. Sotas bishop of Anchialus
ed to refute Prisca, but with no better success,
had to retire from the field in disgrace. These
ings were never forgotten in Asia Minor, and the
of them spread far and wide. In after times the
y in which the discomfiture of the bishops could
lained was by asserting that they had been silenced
d or violence. This was the commencement of the
nmication or secession, whichever it may have
f the Montanists in Asia Minor. "I am pursued
wolf," exclaimed the spirit that spoke through
lla; and her admonition about the end became
mphatic than ever. "After me there will come
r prophetess, but the end." Not only did an
party arise in Asia Minor rejecting all prophecy
Apocalypse of John along with it, but the majority
churches and bishops in that district appear
) to have broken off all fellowship with the new
s, while books were written to show that the very
the Montanistic prophecy was sufficient proof of
ionsness.[1]

aul and Rome the prospect of Montanism seemed
hile more favourable. The confessors of the Gallican
were of opinion that communion ought to be
ned with the zealots of Asia and Phrygia, and
dressed a letter to this effect to the Roman bishop,
erius. Whether this is the bishop of whom Ter-
(*Adv. Prax.*, 1) relates that he was on the point of
peace with the churches of Asia and Phrygia
Montanistic communities is not certain; it was
e or his successor Victor. It is certain, at any
at there was a momentary vacillation even in
Nor is this to be wondered at. The events in
could not appear new and unprecedented to the
Church. If we may believe Tertullian, it was
of Asia Minor, the relentless foe of Montanism,
ceeded in persuading the Roman bishop to with
letters of communion.

, in the last decade of the 2d century two consider
ks appeared in Asia Minor against the Kataphry
The first, by a bishop or presbyter whose name is
own, is addressed to Abircius bishop of Hierapolis,
s written in the fourteenth year after the death
imilla, *i.e.*, apparently about the year 193. The
was written by a certain Apollonius forty years
he appearance of Montanus, consequently about
From these treatises we learn that the adherents of
prophecy were very numerous in Phrygia, Asia,
latia (Ancyra), that they had tried to defend them-

nades, *περὶ τοῦ μὴ δεῖν προφήτην ἐν ἐκστάσει λαλεῖν*. At
time as Miltiades if not earlier, Apollinaris of Hierapolis
e against the Montanists.

selves in writing from the charges brought against
(by Miltiades), that they possessed a fully-devel
independent organization, that they could boast of
martyrs, and that they were still formidable to the ch
in Asia Minor. Many of the small congregations
gone completely over to Montanism, although in
towns, like Ephesus, the opposite party maintained
ascendency. Every bond of intercourse was broken,
in the Catholic churches the worst calumnies were ret
about the deceased prophets and the leaders of the soci
they had founded.

In many churches outside of Asia Minor a diff
state of matters prevailed. Those who accepted
message of the new prophecy did not at once leav
Catholic Church in a body. They simply formed
conventicles within the church; in many instances, in
their belief in the new prophecy may have remain
private opinion which did not affect their positio
members of the larger congregation. Such, for exam
appears to have been the case in Carthage (if we
judge from the Acts of the martyrs Perpetua and Felic
at the commencement of the persecution of Septi
Severus about the year 202. But even here it
impossible that an open rupture should be indefi
postponed. The bishops and their flocks gave offen
the spiritualists on so many points that at last it
be endured no longer. The latter wished for more fas
the prohibition of second marriages, a frank, courag
profession of Christianity in daily life, and entire se
tion from the world; the bishops, on the other h
sought in every way to make it as easy as possible to
Christian, lest they should lose the greater part of
congregations. The spiritualists would have expel
from the church every one who had been guilty of m
sin, the bishops were at that time specially anxio
relax the stringency of the old disciplinary laws.
lastly, the bishops were compelled more and mor
take the control of discipline into their own hands,
the spiritualists, appealing to the old principle that
alone can remit or retain sins, insisted that God Hims
i.e., the Spirit was the sole judge in the congrega
and that therefore all proceedings must be condu
according to the directions of the prophets. On this
especially a conflict was inevitable. It is true that
was no rivalry between the new organization and the
as in Asia and Phrygia, for the Western Monta
recognized in its main features the Catholic organiz
as it had been developed in the contest with Gnostic
but the demand that the "organs of the Spirit" sh
direct the whole discipline of the congregation conta
implicitly a protest against the actual constitution o
church. Even before this latent antagonism was
plain, there were many minor matters which were suffi
to precipitate a rupture in particular congregations.
Carthage, for example, it would appear that the b
between the Catholic Church and the Montanistic
ventiele was caused by a disagreement on the que
whether or not virgins ought to be veiled. For n
tive years (202-207) the Carthaginian Montanists s
to remain within the church, which was as dear to
as it was to their opponents. But at length they qu
it, and formed a congregation of their own, declaring
the Catholic Church was henceforth only a bod
"psychic" Christians, because she would not acknowl
the Spirit whom God had at last poured out on His pe

It was at this juncture that Tertullian, the most fa
theologian of the West, left the church of which he
been the most loyal son and the most powerful suppo
and whose cause he had so manfully upheld against pa
and heretics. He too had come to the conviction tha

ch at large was given over to worldliness, that she forsaken the old paths and entered on a way that lead to destruction. The writings of Tertullian d the clearest demonstration that what is called Mon m was a *reaction* against secularism in the church, an effort to conserve the privileges of primitive Chris ty. At the same time, they show no less clearly that tanism in Carthage was a very different thing from Montanism of Montanus. Western Montanism, at beginning of the 3d century, admitted the legitimacy lmost every point of the Catholic system. It allowed the bishops were the successors of the apostles, that Catholic rule of faith was a complete and authoritative sition of Christianity, and that the New Testament was supreme rule of the Christian life. How, then, one may ask, was it possible to separate from the Catholic rch? On what ground could the separation be justi ? How could it be said that a new era of the Spirit come in when the Spirit had already given all neces instructions in the Scriptures of the New Testament? what claim could be thought to exceed the legitimate ...of the successors of the apostles? Montanus himself his first disciples had been in quite a different position. is time there was no fixed, divinely instituted congrega al organization, no canon of New Testament Scriptures, nti-Gnostic theodicy, and no Catholic Church. There simply certain communities of believers bound to er by a common hope, and by a free organization, h might be modified to any required extent. When tanus proposed to summon all true Christians to Pepuza der to live a holy life and prepare for the day of the l, there was nothing whatever to prevent the execution s plan except the inertia and lukewarmness of Chris om. But this was not the case in the West at the nning of the 3d century. At Rome and Carthage, in all other places where sincere Montanists were d, they were confronted by the imposing edifice of the olic Church, and they had neither the courage nor the nation to undermine her sacred foundations. This ains how the later Montanism never attained a posi of influence. In accepting, with slight reservations, results of the development which the church had rgone during the fifty years from 160 to 210 it ced itself to the level of a sect. For, if the stand t of the Catholic Church is once acknowledged, then tanism is an innovation; and if the canon of the New ument is accepted the doctrine of a new era of the it is heresy. Tertullian exhausted the resources of etic in the endeavour to defend and vindicate the ion of the spiritualists to the "psychic" Christian no one will say he has succeeded in clearing the Mon tic position of its fundamental inconsistency.

f the later history of Montanism very little is known. it is at least a significant fact that prophecy could e resuscitated. Montanus, Prisca, and Maximilla were ys recognized as the inspired authorities. At rare rvals a vision might perhaps be vouchsafed to some tanistic old woman, or a brother might now and then a dream that seemed to be of supernatural origin, the overmastering power of religious enthusiasm was g of which the Montanists knew as little as the Catho Their discipline was attended with equally disap ting results. In place of an intense moral earnestness ing itself by its own strict laws, we find in Tertullian gal casuistry, a finical morality, from which no good l ever come. It was only in the land of its nativity Montanism held its ground till the 4th century. It tained itself there in a number of close communities, ably in places where no Catholic congregation had formed; and to these the Novatians at a later period attached themselves. In Carthage there existed a the year 400 a sect called Tertullianists; and in comparatively late survival we have a striking tes to the influence of the great Carthaginian teacher doctrinal questions there was no real difference b the Catholics and the Montanists. The early Mon the prophets themselves used expressions which to indicate a Monarchian conception of the per Christ. After the close of the 2d century we fi sections amongst the Western Montanists, just as a the Western Catholics, there were some who adopt Logos Christology, and others who remained Monar

MONTE CARLO. See Monaco.

MONTE CASINO (or Cassino). The Benedi
monastery known as the abbey of Monte Cassino is a
square building of three stories, built on the usual Bene
line plan (see Abbey) on the summit of a picturesque iso
hill, about 3½ miles to the north east of the town of Ca
(Casinum) or San Germano (population about 5000), w
lies midway between Rome and Naples in the valley
Garigliano. The most prominent architectural featu
the large church (1727), richly decorated in the interior
marbles, mosaics, and paintings. The library and arc
have been spoken of elsewhere (vol. xiv. pp. 531, 548

The date of Benedict's withdrawal from Subiaco to Cass
529. At that time Cassino was the site of a temple of Apoll
of a grove sacred to Venus. The result of the saint's preachin
that the natives demolished both, chapels to St Martin and
the Baptist being built in their stead, while farther up the
monastery began to rise. About 589 the monks were driven
it to Rome by the Lombards of Benevento, and it lay was
more than a century, until reassociated by Gregory II. (719
787 it received fresh privileges from Charlemagne, in 884
burnt by the Saracens, and was not restored until about se
years later. From 1322 to 1366 the abbot held episcopal
under the house of Anjou he bore the title of *Abbas abbatum*
ranked as first baron of the realm. In 1501 the abbey was s
by the troops of Gonzalo de Cordova. In 1866 it shared th
of all other religious houses in Italy; it is now inhabited by
monks, and used as a seminary, having about 200 pupils.

MONTECUCULI, Raimondo, Count of (1608-1
a prince of the empire and duke of Melfi, a famous Aus
general, was born at the castle of Montecuculi in Mo
in 1608. At the age of nineteen he began his career
regiment of infantry under his uncle, Ernest, cou
Montecuculi; and during the Thirty Years' War he
many opportunities of displaying his military genius i
imperial service. In 1631, having been severely wou
he was made prisoner while retreating after the bat
Breitenfeld. Soon after his release he was promoted t
rank of major; and he distinguished himself at the
of Nordlingen in 1634, and at the storming of Kaisersla
in 1635. As colonel, he took part in much hard fig
in Pomerania and in Bohemia; and in 1639 at M
where he tried to prevent the Swedes from crossing
Elbe, he was taken prisoner a second time, being comp
on this occasion to spend more than two years in St
The time was not lost, for he devoted it to a thorough
of military science. In 1642 he was again at work i
imperial army, and for eminent services in Silesia h
made a major-general of cavalry. After a brief vi
Italy, during which he entered the service of the du
Modena, he returned to Germany, and became coun

ar in 1644. In the following year he supported the
duke Leopold in a campaign against Prince Rakoczy
ransylvania, resisted Marshal Turenne in the Rhine
try, and fought with the Swedes in Silesia and Bohemia.
victory at Triebel in Silesia, in 1647, was due chiefly
m, and he was rewarded by being raised to the rank
eneral of cavalry. After the peace of Westphalia in
he occupied himself for some time with the work of
ouncil of war; and in 1651 he undertook diplomatic
ons to Christina, queen of Sweden, and to Cromwell.
657 he commanded an expedition against Prince
oczy and the Swedes, who had attacked the king of
d, and Rakoczy was soon forced to withdraw from
Swedish alliance, and to accept term of peace. As
marshal he was sent to the aid of Denmark against
den; and this war he conducted so successfully that
peace of Oliva was concluded in 1660. In 1663 he
ned the command of an army with which, for about
years, he had been opposing the Turks; but in 1664
as again made commander-in-chief, and in the same
he defeated the Turks so decisively near the abbey of
Gotthard that they concluded an armistice for twenty
s. He had to deal with more formidable enemies in
2, when, the emperor and the imperial diet having
ved to uphold the Dutch against Louis XIV., Monte-
li, who had been serving as president of the council of
and director of artillery, was appointed commander of
mperial forces. He took Bonn, and, although closely
hed by Turenne, contrived to effect a junction with
rince of Orange, thereby overthrowing all the calcula-
s of the French. When the elector of Brandenburg
ved the supreme command in 1674 Montecuculi with-
from the army; but in 1675, being restored to his
er position, he resumed operations against Turenne.
two commanders manœuvred so brilliantly that for
t four months neither could do the other much injury;
Turenne having been killed by a cannon ball on the 27th
ly 1675, Montecuculi pursued the French into Alsace,
besieged Hagenau and Zabern, retiring from Alsace only
n he found himself confronted by Condé. Montecuculi's
achievement in war was the siege of Philippsburg.
ng the rest of his life he was president of the council
ar. In 1679 the emperor Leopold made him a prince
e empire, and shortly afterwards he received from the
of Naples the dukedom of Melfi. Having accompanied
emperor to Linz during the pestilence, he was injured
he fall of a beam when entering the castle, and died at
s on the 16th of October 1680.

ontecuculi was an ardent lover of science, and wrote several
rtant military works. The *Opere complete di Montecuculi* were
ished in two volumes, at Milan in 1807 at Turin in 1821; and
e is a German translation (1736) of his *Memorie della guerra* and
ssioni d'un generale.

Campori, *Raimondo Montecuculi, la sua famiglia e i suoi tempi* (1877).

MONTELEONE (usually called Monteleone of Cala-
to distinguish it from Monteleone of Apulia in the
ince of Avellino, which gave its name to the mediaeval
y of the Pignatelli family) is a city of Italy in the
ince of Catanzaro, on the western side of the Bruttian
nsula, and is beautifully situated on an eminence gently
ing towards the gulf of Sta Eufemia. It was almost
lly destroyed by earthquake in 1783, and for many
s afterwards consisted mainly of slight wooden erec-
s, but under the French occupation it was made the
tal of a province and the headquarters of General
nier, and it is now a well built town. The castle was
t by Roger, count of Sicily, whom tradition accuses of
ying off the ruins of the ancient temple of Proserpine
e cathedral of Mileto. The population of the town
9244 in 1871, that of the commune 10,262 in 1861
12,047 in 1881.

Monteleone is identified with the ancient Hipponium,
city first mentioned in 389 B.C., when its inhabitants were
to Syracuse by Dionysius. Restored by the Carthaginian
held for a time by Agathocles of Syracuse (294), and aft
occupied by the Bruttians, Hipponium ultimately became
Valentia a flourishing Roman colony. The harbour est
by Agathocles proved of great service as a naval station t
and Octavius in their wars with Pompeius Magnus and
Pompeius, and remains of its massive mason work still exis
village of Bivona on the coast. In the town itself there
traces of antiquity beyond a mosaic pavement in the chur
Leoluca (patron saint of Monteleone) and one or two Latin
tions.

MONTÉLIMAR, chief town of an arrondissement
canton in the department of Drôme, France, is s
near the left bank of the Rhone, 93 miles south of
on the railway to Marseilles. The waters of the R
and Jabron, which unite at Montélimar, spread forth
the plain surrounding the town. A well planted
separates the town from the station, but within th
gate that still remain the streets are narrow and
sting. The ancient castle, one of the most inte
military remains of central France, is now used
prison. Silk throwing and spinning, and the manu
of flowered silks and of hats, are the principal indu
there are also foundries, tool-shops, and tanneries
agricultural implements and hydraulic lime are
Montélimar is famed for its *nougat*, a cake compo
almonds and honey. The population of the town i
was 12,891.

Montélimar was called by the Romans *Acusticæ*. At
period it belonged to the family of Adhémar or Adhemar, wh
present name. After coming into the possession of the
Valentinois, one of the dauphins of Viennois, it wa
by Louis XI. to the crown of France. It frequently
hand during the religious wars, and although it resisted
it was taken in 1589 by Lesdiguières.

MONTENEGRO, often pronounced and som
written MONTENERO (Montenegrin, etc., Servian, *Cr*
Russian *Tchernagorets* and Turkish *Karadagh*, al
valent to Black Mountain), one of the smallest of
pean countries, lies on the eastern side of the A
and is bounded by Dalmatia, Herzegovina, Bosn
Albania. Previous to 1878 it had an area variou
mated at 1669 square miles (Kaptcevitch) 1711 (K
and, including the Kutchi territory, 1796 (Behm)
enlargement to about 5977 square miles proposed by
stefano treaty (1878) would probably have swamp
Montenegrin nationality, and the Berlin congress
the total area only up to 3680 miles, or almost exact
the size of Wales.

often, but wrongly, called Diocleia from its association with the
of Diocletian

ked by extreme simplicity. Chastity is a national
ne, and in time of war the women and children of the
s have often found their safest asylum among their
ditary foes. The main stock of the peoples of Servian
ent; and, though the purity of both blood and language
been to some extent affected by foreign elements, mostly
anian and Turkish, the national unity has not been im-
ed. The curious Gipsy colony, which, though speaking
ian, never intermarries with the Montenegrins, is
erically of little importance.[1] The great mass of the
le belong to the Orthodox Greek Church, only some
0 being Roman Catholics, and 3000 Mohammedans.
ding to Kaptsevitch, the population was 10,700 in
8, 120,000 in 1819, 124,000 in 1852, and 170,000 in
7, but in 1879 it was found that, much in excess of the new
tory, the number could not exceed 130,000 since then
ut 15,000 have been added with Dulcigno. The official
ns for 1882 (not based on a census, however) give
000 as the total, of whom some 25,000 live in the
alled towns.

Fauna. Bears are still found in the higher forests and wolves
specially foxes, over a much wider area. A few hundred feet
the loftier summits the roebuck is not infrequent in the
woods, the wild boar may be met with in the same district and
hare is abundant wherever the ground is covered with herbage.
are one or two species of snake to the country, including the
nous Illyrian viper. Excellent frogs, tree frogs, the common
ise, and various kinds of lizards are all common. The list
observed by Baron Kraliber includes golden eagle and vul-
, 12 species of falcons, several species of owl, nightjar, the
ings, hoopoes, partridges, herons, pelicans, divers, grebes,
uckers, &c. The abundance of fish in Lake Scutari and the
course of the Ryeka is extraordinary, the shoal of fish con-
, *Leuciscus albicanus*, that come up the river forming almost
masses. Both trout and salmon are caught in the Moratcha
r. The flora of Montenegro is comparatively scanty. In
orest districts the beech is the prevailing tree up to a height
00 or 5500 feet, and then its place is taken by the pine. The
nut forms little groves in the country between Podgoritza and
Scutari, but never ascends more than 1000 feet, above the

ontenegro is an absolute hereditary monarchy, vested accord-
o the principle of primogeniture in the family of Petrovitch
gush. The prince bears the title "Prince of Montenegro and
Berda (mountains)"—Montenegro here meaning the old Mon-
grin nahias (provinces) of Katunska, Tzrnitza, Rvetchka, and
Lyeshanska, and Berda the territory added in the 18th c
or the provinces Byelopavlitchska, Piperska, Moratchska,
vitchska, and Kutska. A responsible ministry was introd
1877, and there are now separate departments of justice,
affairs, war, and finance and education. The highest adm
tive body is the council of state, instituted in 1879, and c
of eight members appointed by the prince. Justice in c
cases is rendered in primitive fashion. Formal codes were
up by Peter I. (1798) and by Danilo (1855), but the real
lord is national custom. A great court, consisting of the
prince and ten members named by the prince, is held
capital, and there are inferior courts in each of the cap
56 in 1879. While formerly the very president of the

NTE SANT ANGELO, a city of Italy in the pro of Foggia (Capitanata), 10 miles north of Manfre stands on the hill-foot of Monte Gargano 2824 feet In 494 the archangel Michael pointed out the o St Laurentius, archbishop of Sipontum (Man a) and the chapel, which was built over the cave, h he drew more particular attention, soon became ous place of pilgrimage. Though plundered by ombards in 657, and by the Saracens in 869, St 's was already a wealthy sanctuary in the 11th , and its prosperity continued till the time of the occupation. The canons (*Canonici Gargani*, as they are usually called) maintained a prolonged with the Sipontine archbishops for episcopal indepen According to Ughelli (*Italia Sacra*, vol. vii. p. a marble statue of the saint by Michelangelo Buo took the place of a silver image. The bronze still preserved are fine pieces of Byzantine work, m an inscription bears witness, in Constantinople in The town of Sant' Angelo, which had only about inhabitants in the 17th century, numbered 14,759 in and 13,902 in 1871. Besides the festival of the celebrated on the 9th of May, there is a great fair 29th of September.

MONTESQUIEU, Charles Louis de Sec Baron de la Brède et de (1689-1755), philosophi torian, was born at the chateau of La Brède, about 1 to the south-east of Bordeaux, in January 1689 (the date being unknown), and was baptized on the 1 that month. His mother was Marie Françoise de Pe heiress of a Gascon English family. She had brou Brède as a dowry to his father, Jacques de Secondat, a ber of a good if not extremely ancient house, which first to have risen to importance in the early days of th century. The title of Montesquieu came from his Jean Baptiste de Secondat, "président à mortier" parliament of Bordeaux, an important office, which, as his title, he left to his nephew. Montesquieu was youth known as M. de la Brède. His mother died w was seven years old, and when he was eleven he was the Oratorian school of Juilly, near Meaux, where he exactly five years, and where, as well as afterwards deaux, he was thoroughly educated. The family h been connected with the law, and Montesquieu was d for that profession. He was made to work hard at withstanding his prospects (for his uncle's office was reversion); but, as in his later life, he seems t tempered much study with not a little society. His died in 1713, and a year later Montesquieu, or, as he at this time strictly be called, La Brède, was admitte sellor of the parliament. In little more than another month he married Jeanne Lartigue, an heiress a daughter of a knight of the order of St Louis, but somewhat ill educated, and a Protestant. Montesqui not seem to have made the slightest pretence of affec fidelity towards his wife—things which, indeed, th did not demand; but there is every reason to believ they lived on perfectly good terms. Like the three p years, 1716 was an eventful one to him; for his unc leaving him his name, his important judicial office, whole fortune. He thus became one of the riche most influential men in the district. He continued his presidency for twelve years, in the course of w had much judicial work to perform, as well as the script administrative functions which under the old fell to the provincial parliaments. He was none t addicted to society, and he took no small part in t edings of the Bordeaux Academy, to which he cont papers on philosophy, politics, and natural scienc also wrote much less serious things, and it was dur earlier years of his presidency that he finished, if he begin, the *Lettres Persanes*. They were completed 1721, and appeared in that year anonymously, with on the title page, but they were really printed and pu at Amsterdam. This celebrated book (the original of which is generally set down to a work of Dufres comic author, but which is practically original) wou been surprising enough as coming from a magistrat highest dignity in any other time than in the regenc duke of Orleans, and even as it was it rather scan the graver among Montesquieu's contemporaries. ause of letters written by and to two Persians of dis

ing in Europe, Montesquieu not only satirized
ally the social, political, ecclesiastical, and literary
of his day in France, but indulged in a great deal of
e writing (so free as very nearly to deserve the term
ous) which was characteristic of the tale tellers of the
But what scandalized grave and precise readers
lly attracted the majority, and the *Lettres Persanes*
ery popular, passing, it is said, through four editions
the year, besides piracies. Then the vogue suddenly
or at least editions ceased for nearly nine years to
. It is said that a formal ministerial prohibition
e cause of this, and it is not improbable; for, though
gent and Dubois must have enjoyed the book
ghly, they were both shrewd enough to perceive that
neath its playful exterior there lay a spirit of very
enient criticism of abuses in church and state. The
that the *Lettres Persanes* is the first book of what is
the Philosophe movement. The criticism is scarcely
gressive, much less destructive, and in Montesquieu's
it never became so; but what it might become in
nds of others was obvious enough. It is this p
ship in his own special line which in all probability
Voltaire so jealous of Montesquieu, as well as the
age which a wealthy and well-born noble of high
position had over himself. It is amusing to find
e describing the *Lettres* as a "trumpery book," a
which anybody might have written easily." It is
rtain that, in its peculiar mixture of light badinage
ot merely serious purpose but gentlemanlike moderation
Voltaire could have written it himself, and it is
that no one else at that time could. The reputation
quired by this book brought Montesquieu much into
erary society of the capital, and he composed for, or at
e contributed to, one of the coteries of the day the
but rather rhetorical *Dialogue de Sylla et d'Eucrate*,
h the dictator gives an apology for his conduct. For
oiselle de Clermont, a lady of royal blood, a great
and a favourite queen of society, he wrote the
s prose poem of the *Temple de Gnide*. This is half
ative, half an allegory, in the semi classical or rather
-classical taste of the time, decidedly frivolous and
sly moral, but of no small elegance in its peculiar
A later *jeu d'esprit* of the same kind, which is almost
ot quite certainly Montesquieu's, is the *Voyage à*
s, in which his warmest admirers have found little to

In 1725 Montesquieu was elected a member of the
ny, but an almost obsolete rule requiring residence in
was appealed to, and the election was annulled. It is
ul whether a hankering after Parisian society, or an
on to belong to the Academy, or a desire to devote
f to literary pursuits of greater importance, or simple
ess of not wholly congenial work determined him to
his Bordeaux office; it is certain that he continued
it but a short time after this. It is tolerably clear
had already begun his great work, and the character
e papers which, about this time, he read at the Bor
Academy is graver and less purely curious than his
contributions. In 1726 he sold the life tenure of his
reserving the reversion for his son, and went to live
capital, returning, however, for half of each year to
de. There was now no further formal obstacle to his
on in the Académie Française, but a new one arose.
hers had brought the *Lettres Persanes* specially under
nister Fleury's attention, and Fleury, a precisian in
ways, was shocked by them. There are various
ts of the way in which the difficulty was got over,
seem to agree that Montesquieu made concessions
were more effectual than dignified. He was elected
ceived in January 1728. Almost immediately after-
he started on a tour through Europe to observe
men, things, and constitutions. He travelled t
Austria to Hungary, but was unable to visit Turke
had proposed. Then he made for Italy, where
Chesterfield. They sojourned together at Venice fo
time, and a curious story is told of the way in whic
a piece of mischief on Chesterfield's part, or Monte
own nervousness and somewhat inordinate belief in
importance, made the latter sacrifice his Venetian
At Venice, and elsewhere in Italy, he remained
year, and then journeyed by way of Piedmont a
Rhine to England. Here he stayed for some e
months, and acquired an admiration for English cl
and poultry which never afterwards deserted him
returned, not to Paris, but to La Brède, and to

The virtue of Montesquieu's book is not in its facts
its views. is (putting Bossuet and Vico aside)

st important essay in the philosophy of history. int of view is entirely different from that of Bossuet, seems entirely improbable that Montesquieu knew ng of Vico. In the *Grandeur et Décadence* the ter treated of the *Esprit des Lois* appear with the neces bordination to a narrower subject. Two things are lly noticeable in it: a peculiarity of style, and a ity of thought. The style has a superficial defect must strike every one, and which was not overlooked e who were jealous of Montesquieu at the time, e is broken up into short paragraphs of but a few ch, which look very ugly, which irritate the reader aking the sense, and which prepare him to expect ne and ostentation sometimes are. The blemish, r, is chiefly mechanical, and, though no editor ha had the perhaps improper audacity so to do, it be perfectly possible to obliterate it without changing On the other hand the merits of the expression y great. It is grave and devoid of ornament, but ginarily luminous and full of what would be called n, if the word epigram had not a certain connotation ancy about it. It is a very short book, for, printed e type with tolerably abundant notes, it fills but ndred pages in the last edition. Montesquieu But no work of the century contains, in proportion to its size, eighty and one-half thousand historical objects, lonte-queu has over Tacitus the advan

ough, however, that *Lucien Le* the style of his ork may be said to have been ted, and though t that work was as we have all probability composed Montesquieu was went on cultivating the ground differently both ndent and as an improvement however. He had , sometimes on his own account sometimes on that , and in one case he won from a city of Bordeaux than eleven hundred *arpents* at once the na *lands* of the country. He is said to have a history of Louis XI, and the story that it mpleted but burnt by him He wrote the of *Lysimaque* for Samuel Le In he published l final edition of the *Temple de Gnide* of the *Lettres*, of *Sylla et Eucrate* which indeed had never been ed, properly speaking. Nor did he revise the *Considérations* to be reprinted without alterations. One half times he revised and corrected it. He also took ains with the education of his son Charles and his er Denise, of whom he was extremely fond. He tly visited Paris, where he frequented the salons of Madame de Tencin and Madame d'Aiguillon the time he must have been widely well-known at k, indeed, a contemporary accuses him of having me into society to pick up material for it. But it that he did not begin the final task of composition 3. Two years of uninterrupted work at La Brède the greater part of it and two more the rest. It ally published at Geneva in the autumn of 1748, in nine *quarts*. The publication was, however, y one of the oldest incidents which in literature tive's well-known saying about court-martialling war. quieu summoned a committee of friends according ry common practice, to hear and give an opinion work. It was an important and certainly not an dly one constituted. Jonard, Helvetius, the financier tte, the dramatist Sorin, Crébillon the younger, tly, Fontenelle, in fact, all sorts and conditions ry men. The members of this eminently competent l unanimously, though for different reasons and in t forms of expression, advised the author not to publish a book which has been recently describe judge of certainly not less competence as "one of th important books ever written," and which, when imp of matter and excellence of manner are jointly cons may be almost certainly ranked as the greatest b the French 18th century.

Montesquieu, of course, did not take his friends' adv such cases no man ever does, and in this case it was ce fortunate. The *Esprit des Lois* represents the ref of a singularly clear, original, and comprehensive mi rected by forty years' study of men and books, arran accordance with a long deliberated plan, and conc language of remarkable freshness and idiosyncrasy title has been somewhat cavilled at, and, like that *Considérations*, it gave a handle to the somewhat ma frivolity of the salons. But if it had been presen full it would have escaped nine criticism w has received. In the original editions it runs *L des Lois, ou du Rapport que les Lois doivent avoir Constitution de chaque Gouvernement, les Mœurs, le C le Religion, le Commerce, etc.* It consists of thi books, which in some editions are grouped in six parts division into parts is known to have entered in author's original plan, but he seems to have changed hi it. Speaking summarily, the first part, con eight books, deals with law in general and with fo government, the second, containing five, with n arrangement, with taxation, &c.; the third, containi with manners and customs, and their dependen climatic conditions; the fourth containing four, wi nomic matters; and the fifth, containing three, with re The last five books, forming a kind of supplemen pecially with Roman, French, and feudal law. Th noteworthy peculiarity of the book to a cursory rea in the section dealing with effects of climate, an indeed was almost the only characteristic which the took in, probably because it was easily susceptible parody and *reductio ad absurdum*. But this th but the least part of the claims of the book to att its vast and careful collection of facts, the novel brilliancy of the generalizations founded on the constructive spirit which penetrates it, its toleran placid wisdom lighted up by vivacious epigram, con escape the most careless reader. The singular sp moderation which distinguishes its views on politi religion was indeed rather against it than in its fa France, and Helvetius, who was as outspoken as h good-natured, had definitely assigned this as the rea his unfavourable judgment. On the other hand, destructive it was sufficiently critical, and it thus enemies on more than one side. Montesquieu was t too English in his ideas by some, the severe de of orthodoxy considered him latitudinarian, an zealous Jansenist informed him that he was "a it was long suspected, but is now positively know the book (not altogether with the goodwill of the was put on the Index, and the Sorbonne projected, it did not carry out, a regular censure. To all the pretor, the author replied in a masterly *défense* there seems to be no foundation for the late and scan stories which represent him as having used Mada Pompadour's influence to suppress criticism. T was that, after the first snarlings of envy and incomp had died away, he had little occasion to complain. Voltaire, who was his decided enemy, was forced at to speak in public, if not in private, complimentarily *Esprit*, and from all parts of Europe the news of arrived.

Montesquieu enjoyed his triumph rather at La Brè at Paris. He was becoming an old man, and, unlike

he does not seem to have preserved in old age the
on for society which had marked his youth. A rather
us description, published long after his death, repre
him as "wandering in his woods from morn to night
a white cotton nightcap on his head, and a vine prop
s shoulder." This, in the florid language of its time
Republican period), is probably only an imaginative
ession of his known interest in managing his estate
he certainly spent much of his later years in the
y, though he sometimes visited Paris, and on one
had the opportunity, which he is likely to have en
, of procuring the release of his admirer La Beaumelle
an imprisonment which La Beaumelle had suffered
instance of Voltaire. He is said also to have been
mental in obtaining a pension for Piron. Indeed,
ent or unlucky men of letters found in him a constant
ctor, and that not merely at the royal expense. Nor did
any means neglect literary composition. The curious
romance of *Arsace et Ismène*, a short and unfinished
se on Taste, many of his published *Pensées*, and much
blished matter date from the period subsequent to
Esprit des Lois. He did not, however, live many years
the appearance of his great work. At the end of
he visited Paris, with the intention of getting rid of
ease of his house there and finally returning to La
. He was shortly after taken ill with an attack of
, which seems to have affected the lungs, and in less
a fortnight he died, on 10th February 1755, aged
sixty. He was buried in the church of Saint Sulpice
little pomp, and the Revolution obliterated all trace
remains.

literary and philosophical merit of Montesquieu and his
on, actual and historical, in the literature of France and of
e, form a subject of rather unusual interest of its kind. At
ginning of this century the vicomte de Bonald classed him
Racine and Bossuet, as the object of a "religious veneration
g Frenchmen." But Bonald was not quite a notable per-
or France, and it may be doubted whether the author of the
des Lois has ever really occupied any such position in his
untry. For a generation after his death he remained indeed
ol and the great authority of the moderate reforming party
nce, and at such times as that party recovered power during
evolutionary period Montesquieu recovered some with it
he tendency of the century and a quarter which have passed
his death has been to reduce the number and position of
arty ever more and more, and Montesquieu is not often quot
n quoted, either by Republicans, Bonapartists, or Legitimists
present day. Again, his serious works contain a certain set
on to a vast number of facts, and the exactitude it be hoped
osterity will not call it the pettifogging strictness of our
challenges the accuracy of these facts. Although he was
the founder, or at least one of the founders of the science of
rative politics and of the philosophy of history, his disciples
and followers in these sciences (and they have outgrown
In France his popularity has always been distinguished com
It is a singular thing that, until within the last few years,
has been no properly edited edition of his works, and nothing
approaching a complete biography of him, the place of the
being occupied by the meagre and rhetorical *Eloge* of the
ntury. He is his chief admirers assert, hardly read at all
nce to-day, and a tolerable familiarity with most modern French
ure enables its possessor to corroborate this by his own
edge, to the effect that no writer of equal eminence is so little
d. The admirers just mentioned attempt to explain this
fessing that Montesquieu, great as he is, is not altogether
ecordingly to French principles. It is not only that he
manian, but that he is rather English than French in his
ought. His work, at least the *Esprit*, is lacking in
n and the almost ostentatious lucidity of arrangement which
ehman demands. His sentences are often enigmatical, and
tive rather than clear. He is almost entirely dispassionate in
s, but he lacks the unswerving deductive consistency which
men love in that science. His wit, it is said, is quaint and
provincial, his style irregular and in no definite *genre*.
e of these things may be allowed to exist and to be defects
ntesquieu, but they are balanced by merits which render
almost insignificant. Of the minor works, which are on the
rather unworthy of their author, nothing need be said here
few *Pensées*, and in detached thoughts of the same kind
scattered about the tolerably numerous letters which have
us, there is much acuteness and point, as also in some of
sentences of the *Considérations* and of the *Esprit*. But no o
put Montesquieu as a *penseur*, or maxim-writer, beside La
foucauld and Joubert, Pascal and Vauvenargues. It is on
principal works that his fame does and must rest. Each
these is a masterpiece in its kind. It is doubtful whe
Lettres Persanes yield at their best either in wit or in gra
pictures of the time to the best of Voltaire's smaller work
they are more unequal. There is, moreover, the great d
between Montesquieu and Voltaire that the former is a
reformer, and not a mere *persifleur* or *frondeur*, to who
finding is more convenient to show the other way than acqu
Of course this last description does not fully or always
Voltaire, but it often does. It is seldom or never appli
Montesquieu. Only one of Voltaire's

MONTFLAUROT (?–1666), the
the "three kyngs" of mediæval composition, was born
but little is known of his life. He was ordained at an early age a
to the duke of Montfort and another composition with
under Dufresnoy the duke's music-master
thoroughly mastering the difficu
musical science. He bewailed a contrapuntal
and his own imperfect, but he was a bold
his needs and empirical methods of composition
a lasting influence upon the progress of art. He
the composer who ventured to use unprepared
employing them first in his madrigals, the beauty
they utterly destroyed, but afterwards introduced
into music of another kind with such excellent effe
their value was universally recognized, and all opp
to their use effectually silenced. In 1603 he

eri as "maestro di capella," and in 1607 he produced, marriage of Francesco Gonzaga, his first opera, , in which he employed the newly-discovered dis- ith great dramatic effect. Though he did not invent the ramatic Peri's *Euridice* having been produced at e in 1600 he raised it to a level which distanced temporary competition. His second opera, *Orfeo*, ed in 1608, was even more successful than *Arianna*, s based upon a principle which is held by some critics to embody the only law to which the ic composer owes obedience that of accommodating sic to the exigencies of the scene. In 1613 Monte as invited to Venice, as "maestro di capella" at St Here he composed much sacred music, the greater which is lost, a circumstance the less to be regretted, s *Vespers* and *Masses* bear no comparison with those ed by his predecessors in office. In 1630 he wrote grand opera, *Proserpina rapita*. In 1639 he pro *d'Adone*, and in 1641 *Le Nozze di Enea* and *Arianna*. These later works show him still greatly in of his age, notwithstanding the progress made by mposers since the production of *Orfeo*. Monteverde dained priest in 1633, and he died in 1643 uni respected. Though his free employment of the nt seventh and other unprepared discords put an he school of Palestrina, it led the way to the greatest ment of modern music.

NTEVIDEO, SAN FELIPE Y SANTIAGO DE, the capital republic of Uruguay (Banda Oriental) in South a, lies on the eastern side of a nearly semicircular the northern shore of the estuary of the La Plata, les from Buenos Ayres, with which communication tained by a daily service of steamers. The small la on which the city is built does not rise more feet above the level of the sea; but the headland o, 505 feet high, which forms the western side of , is notable enough on that low lying coast to justify e Montevideo it is crowned by a lighthouse, and d Spanish fort, once of considerable strength. About res is the area occupied by the city proper; the , stretch for miles into the country. The plan both old and the new town is regular, they are separated Calle de la Ciudadela on the line of the old rampart- what Oriental appearance is produced by the low with their flat terraced roofs and *miradores* or watch- from which the merchants look out for ships. A- , the city is overbuilt, and immense wealth has been ed in Italian marbles and other forms of archi decoration. The streets are for the most part well and there is an extensive tramway system. Mare was for some time employed to make gas for light t an epidemic having commenced at the gas yard ks were for a time closed, and when they were re coal gas was substituted. Previous to 1870, when as introduced from a distance of 40 miles, the whole was dependent on the rainfall. In the old town ipal square is the Plaza de la Constitucion, the de of which contain the "cathedral" and the north *cabildo* (law courts, senate houses and prison). The al (as it is usually called, though the bishop is a *in partibus*, and take his title from Meopta in Asia is a somewhat imposing building, consecrated 21st 1804, with a dome and two side towers 133 feet hich form one of the best landmarks of the bay. In of the old ramparts formerly stood the old Spanish which was built by the seven years' forced labour Guarani Indians. From 1835 to 1868 it served as cipal market in the city; in 1877 it was removed area united with the fine Plaza de la Independencia outh western end of the Calle del 18 Julio, a broad street which runs in a straight line right through the town. The new market, covering 2 acres, was bui 1867 at a cost of £86,000, and there are besides the market (cost £55,320) and the Mercado Chico. Th change, constructed after the style of the house at Bord dates from 1864, and cost £32,000. Of note also ar custom-house, the post office (1866), the museum, the p library (founded in 1830 by Dr J. M. Perez Castellano) university (dating from 1849), the Solis theatre (1856) British hospital (established in 1857, present building 18 the Hospital de Caridad (founded by Francisco A. Ma 1825), having an average of 300 patients, the new lu asylum (1877), the Basque church (1858), and the En church (1815), built on the site of a battery taken in by Sir Samuel Auchmuty's forces. Since the beginni

Map of Montevideo.

the century the depth of water in the bay has been allo to diminish 5 feet, and the area has been reduced by construction (1868) of an embankment to carry the rai across it. Dredging has been tried from time to time on too limited a scale. The so called harbour is a spa less than half a mile square off the north west face of town; in 1870 it was reported to be yearly becoming sm and less safe, and vessels are now obliged to anchor fa out. Among modern improvements in the port the noteworthy are the Mana dry docks, opened in 1873, the larger docks, erected in 1877 at a cost of 2,000 dollars, at the foot of the Cerro on the other side o bay. The trade of Montevideo consists mainly in the port of the raw products of the slaughter-house (h hides, hair, tallow, wool, bones), with a certain quanti live stock and preserved meat, and in the import of Euro manufactures. During the five years 1877 1881 the ave value of the exports was £2,303,061, and that of the im £3,169,997. Of the 1041 vessels (tonnage 780,870) w entered in 1879, 285 were English, 157 Spanish, 145 Ita 112 German, and 99 French. The population is large foreign origin, Italian, Spanish, Basque, and French. 1871 the Italians, who had rapidly increased after siege, were about 40,000 strong, and in several quarte the city nothing was to be heard save North Italian dia Even in 1880, after the exodus caused by the confisca of 1875, they numbered 36,300. The greater propo are engaged as petty traders. In 1879 the total popul of the town was 73,879; it had been 92,260 in 1878, 105,296 in 1871, and now (1883), including the envi is 110,167.

Montevideo owes its origin not to the commercial advan of its position but to the jealousy of the Spaniards toward Portuguese, which led Zabala, viceroy of Buenos Ayres, to e fort at this point in 1717. In 1726 the first settlers were i duced from the Canary Islands and Andalusia, and more than

assed before the settlement was declared a port: but by had 6160 inhabitants, and by 1792 was importing to the 2,993,267 dollars, and exporting to the value of 1,150,523. the governor of Montevideo was the first to revolt against nish authorities, and to establish an independent junta: years later, after much disastrous confusion and conflict, the ame the recognized capital of the newly-formed republic la Oriental. Its population, which had been about 36,000 pening of the century, was reduced to 9000 by 1829, and ardly recovered its ground in this respect (31,189 when, Rosas, dictator of Buenos Ayres, wishing to compel annexa Buenos Ayres, commenced the siege which was irregularly ed till 1852, and left the city and the country exhausted ost ruined. By 1860, however, the population had ri to 49,518; and though the Brazilians blockaded the port -5 and reinstated ex-president Flores the prosperity of the s but little impaired. During the Paraguayan war, which ill 1864, Montevideo grew rapidly rich, attracting a large f the trade diverted from Buenos Ayres. Immigrants from all quarters, and extensive investments were made in s of real property. The valuation of the city and suburbs was 11,156,000 dollars in 1860, reached the sum of 000 dollars in 1872. Reckless speculation, political dis and the financial mismanagement of the Government have avily; the value of house property has greatly diminished, mercial activity has been grievously restricted. Since 1881, , Montevideo has been rapidly recovering, and its natural ges are so great that, with better political circumstances of yet higher prosperity may be anticipated.

of Montevideo will be found in Bonelli, *Descrizione della città e del Porto*, &c., 1841; *Brial, the River Plate*, &c., 1861, and the supplemental volume, 1865; *Handbook of the River Plate Republics*, 1865; and Gallenga, *South* 1881. See also Bognacciello, *Delle cagioni che hanno impedito nuovi incrementi di Montevideo nell' Uruguay*, Genoa, 1870; *La Repubblica Uruguay* reports of the municipal junta, and Vadillo's statistical publications.

NTFAUCON, BERNARD DE (1655–1741), critic and , was born of a noble and ancient family at the of Soulage (now Soulatge, in the department of France), on 13th January 1655. Though destined for y, he passed most of his time in the library of the of Roquetaillade (the usual residence of his family), ing books in different languages and on almost every of subject, his studies being directed by a learned of his father, Pavillon, bishop of Alet. In 1672 ered the army, and in the two following years served lunteer in Germany under Turenne. But ill health e death of his parents brought him back to his s life, and in 1675 he entered the cloister of the egation of St Maur, at La Daurade, Toulouse, taking ws there on 13th May 1676. Apart from his vast labours, the remainder of his life presents little to He lived successively at various abbeys at where he specially studied Greek and examined nerous MSS. of the convent library, at La Grasse, Bordeaux; and in 1687 he was removed to Saint in des Prés. From 1698 to 1701 he lived in Italy, in Rome. Returning to Saint Germain, he was member of the Academie des Inscriptions et Belle s in 1719. He died on 21st December 1741.

irst publication, in which he was assisted by Lopin and was the first volume of a never completed series of previously shed *Analecta Græca* (1688). In 1690 appeared his defence terally historical character of the book of Judith. *Hexapla nnaa*, still the best edition of that father, was issued with phy and critical notes in 1698. The first-fruits of his visit were seen in his copious *Diarium Italicum, ex monumentis veterum, bibliothecarum, musæorum, &c., potissimum Italiæ collecta* (1702). The *Palæographia* [illegible] *orbis et progressu literarum Græcarum, et de variis codicum scriptionis Græcæ generibus* (1708) is a standard work, has not yet been superseded: in its own field it is as original *re diplomatica* of Mabillon. In 1713 Montfaucon edited *rum Origenis quæ supersunt* (2 vols. fol.) only recently led by the work of Field; and between 1718 and 1738 he ed his edition of *Joannis Chrysostomi opera omnia* (13 vols ich is hardly an improvement upon that of H. Saville. His *uité expliquée et représentée en figures* (10 vols. fol., 1719 of itself suffice to establish a reputation for colossal dili It was continued by him in *Les Monumens de la Monarchie se* (5 vols. fol., 1729–1733). A complete list of his literary including his numerous contributions to the *Mémoires* of the Academy of Inscriptions, will be found in the *Nouvelle Bi Générale*, s.v. "Montfaucon."

MONTFORT, SIMON DE, EARL OF LEICESTER (c 1265), a great political leader, and sometimes e ferred to as the "founder of the English House o mons," born in France about the beginning of th century, was the fourth and youngest son of Sim de Montfort and of Alice de Montmorency. Of h life and education nothing is known, the first de recorded fact about him being that in April 1230 in England and had attached himself to the ser Henry III., who granted him a temporary pension marks, with a promise of the earldom which his fath held.[1] In the following year he did homage f honour of Leicester, and in 1232 the king confir him all the land with appurtenances which had be to the late earl in England. But, though thus fo admitted to the ranks of the English baronage, he for several years succeed in making way against the dislike in which "aliens" were now held and unti most of his time was spent, in considerable p abroad. In that year however, he attended the marriage to Eleanor of Provence as lord high st and thenceforward began to take part in the bu the royal council. Handsome, talented, and bra gained the love of Eleanor widow of the earl of Pe and sister of the king, to whom he was privately m at Westminster on 7th January 1238, Henry giving away the bride. When the fact became the indignation of the baronage and of the peop almost broken out in open rebellion, and, after Sim with difficulty averted this by propitiating his b in law, Richard, earl of Cornwall, he found it neces to go to Rome to meet the objection which the chur raised on the ground of an alleged previous vow m Eleanor. Having succeeded in obtaining (by brib would seem) the papal sanction to his marriage, returned to England in October, and early next ye to the enjoyment of the royal favour, he had the d of Leicester formally conferred upon him in presen the assembled barons. In June (1239) he asserted h father and high steward at the baptism of Prince Ed but the machinations of his enemies were soon atte successful in bringing about a change in the fickle b of Henry, and when Simon came back to Westmin Advised to attend the churching of the queen th met him with the information that he was an excom cated person, and ordered him to leave the church." with his wife he forthwith went into voluntary e France, but in April 1240 he returned to England was received by the king on a footing of at least o friendship. Of his private and public life duri

[1] Gregory IX. to Montfort, the well-known Albigensian cru to [illegible] sister, Amicia de Beaumont, countess of Devon and co heiress o the Peverels, and [illegible] succeeded to that earldom in 1 to [illegible] was celebrated in the high steward's hall of England, he presence of [illegible] with the title. Soon afterwards he was deprive French possessions under some pretext, the real reason b being his prepotent influence. Dispossessed of the French fiefs ag Albigensian [illegible]. He retired then again towards the end [illegible] however being committed to his nephew [illegible] Earldom. Besides [illegible] between England and France the early years of Henry III made it practically impossible for De Montfort to maintain any hold upon the Duchy [illegible] on the death of Simon IV. in 1218; in 1231, after the p cide of Simon Viscount of Beaumont renounced all r the latter became the full claimant to his next surviving brother's

[2] There is no evidence that Simon actually had been ex cated, but it seems clear that certain payments he had agreed to the bargain arranged had not been punctually attended to, one annoyance had been in this way carried to the king. Th of immoral relations with Eleanor was probably only a conv coarse way of reiterating the ecclesiastical offence for which M fort had already purchased absolution.

ght years very few facts have been preserved. s some ground for believing that he went to the nd in 1240, and a letter is still extant in which nity of the kingdom of Jerusalem ask Frederick ne 1241) to allow Simon de Montfort, earl of r, to act a regent till the arrival of his son Conrad. he accompanied Henry's unsuccessful expedition ce. In the parliamentary history of these years e appears but seldom, but where he is mentioned ariably found on the side of the people resisting arbitrary wastefulness of the king and the exactions of the pope. In 1248 De Montfort ointed for six years the king's "seneschal," or tenens," in Gascony. In this capacity he was dequately supported from home with either men y, he more than once subdued the rebellions s, indeed, but meanwhile his enemies at home trength and encouraged the Gascons in repeated ns and complaint against the seneschal. These re one-sided inquiry, but ultimately in his acquittal, to a demand on his part for reparation, and a con quarrel with the king. Towards the end of 1252 ontfort retired into France, where such was the on he enjoyed as a statesman that, on the death of en regent and in the absence of Louis IX., he wa the office of high steward and a place among the ns of the crown. This, however, he declined, "being e to prove a troublesome friend," and, after a partial recon with Henry, he returned to Parliament in 1254. In owing year he was sent on a secret mission into d, and in 1256 he was one of the king's arbitrators , but in consequence between 1254 and 1258, e to judge by the prominent place he took in the on of the latter named year, must have been in the of parliament. At the Westminster parliament 1258 it was largely upon the carls of Gloucester and Leicester that the reforming half-brother, William nce laid the blame of all the evil under which the was groaning. De Montfort in particular being y him "an old traitor and a liar." With Leicester om the latter leagued for the defence of them and presented their demands at the meeting extorted the appointment of the committee of lours to meet at Oxford and proceed at once with m of the realm. The Provisions of Oxford having ed (October 1258) De Montfort received the ex- the castle of Winchester, where the parliament co its session. He meanwhile apparently holding the of military commander-in-chief, and after the of the barons to London, he was appointed to rules ntary to Scotland. In the early part of 1259 he dly buried with the task of adjusting the terms of with France, which was not settled until the end of . From the date of the conclusion of that peace, divisions in the reforming party, the Lusignans ne to power, and in 1262 he felt himself strong to repudiate the Provisions of Oxford, thus giving ed for civil war. The rallying of the barons, led Montfort, in the west, and his victorious entry into again reduced the king to submission, but only to ce more at once to pronounce the divided state of er's supporters. Louis, consulted as to Mise of Amiens however, rendered another appeal to arms on the the barons' side, and by the victory of Lewes May 1264) De Montfort for the time became master ngland. Taking Henry, his prisoner, along with him don, he summoned thither the parliament, which June, and drew up the constitution or scheme of ent associated with his name, of which the most feature is the new development it gives to the representative system. A still further advance in t development took place in 1265, when borough membe as distinguished from county members, were for the fi time summoned. Meanwhile troubles in the west requir De Montfort's presence in the field, and, by the alliance his rival Gloucester with Roger Mortimer, as well as the escape of Prince Edward, who put himself at the he of the royalist opposition, the great parliamentary lead was placed in serious straits. At Evesham, where he h halted on his march to join his son at Kenilworth, he w surprised by the army of Prince Edward, and after struggle of about two hours was slain on the field of bat (4th August 1265). As regards the personal character De Montfort, it is not surprising to find that contempora opinion was divided; but of his determination, constanc and energy there can be no question, while much is re vealed by the fact that, though in an unauthorized wa his memory was revered in England as a saint and mart offices were drawn up in his honour, his intercession voked, and miraculous virtues attributed to his reli The painstaking labours of recent investigators have tend to hurl into clearer light the purity and nobleness of p pose of Simon de Montfort as a consistent defender of t rights of the governed; on the other hand, it has also come obvious that the representative institutions of E land, though largely helped forward by him, can hardly claimed as his creation. Thus on both sides the statem of Hume that the House of Commons was planted by t man person- hand of this bold and artful conspirator m be rejected as inconsistent with the facts.

Compare Prothero, vol. viii. p. 310 *sqq.*, and see the monogra of Pauli *Simon von Montfort, Graf von Leicester, Der Schöpfer des ersten Parlaments*, Tübingen 1867) and Protheroe, *The Life Simon de Montfort*, 1877), and the literature there referred to.

MONTGOMERY (Welsh, *Sirgrug Tre Faldwyn*), inland county of Wales, is bounded E. by Shropshire, N by Denbigh, N.W. by Merioneth, S.W. by Cardigan, and by Radnor. Its greatest length from south-east to nor west is about 40 miles, and its breadth from east to w about 35 miles. The area is 495,089 acres, or about 7 square miles. The surface is broken and undulati but it is only round the borders of the county that hills reach any great height, the highest summits of different ranges being generally in the adjoining count To the north are the Berwyn chain, stretching into Denbi shire; in the east the Breidden hills, in the south the Ke hill; and in the south-west Plinlimmon, the highest sum of which is in Cardigan. These various mountain ran form the water-bed of the numerous rivers of Montgome shire. With the exception of the Dyfi, which rises n Bala Lake and falls into Cardigan Bay, and the Wye, wh flows south into Radnorshire, all the principal rivers tributaries of the Severn (Welsh, *Hafren*), which rises the east side of Plinlimmon and traverses the whole leng of the county from south-west to north-east. The princi of these tributaries are the Clywedog, the Taranon, Rhiew, and the Vyrnwy. This fine succession of riv valleys broaden out as they reach the great vale of Severn, and the beauty of the scenery is enhanced by abundance of oak and other trees. The Montgomerysh canal which has a length of 27 miles, and passes principal towns, is connected with the Ellesmere ca thus affording water communication with Chester a Shrewsbury.

Montgomeryshire is occupied chiefly by Lower Silur rocks. The boundary between it and Merioneth is form by the Bala beds. In the centre and east, near Llanf and Montgomery, Wenlock shales prevail. In the neig bourhood of Welshpool the Silurian rocks have been f quently dislocated by volcanic masses, one of the m

kable of which is Corndon Hill, rising to a height of feet. In some places the sedimentary rocks have penetrated by trap mingled with shale or schist. the line of dislocation there are frequent deposits tallic lodes, carried there by the heated water rising below. The lead mines of Montgomeryshire are of con ble importance, and at present the metal is wrought en different places. In 1881 the amount of lead ore ed in the various mines was 3132 tons, yielding 2693 l lead and 25,132 oz. of silver the total value being 95. There were also obtained 1111 tons of zinc ore ielding 610 tons of zinc, of a total value of £3231.

ulture. The climate is mild and genial and the soil in the remarkably fertile, especially along the banks of the Severn derable portion on the border of Merionethshire, however d chiefly by heath and moss. The number of holdings has ather decreasing of late years, the decrease being chiefly in below 50 acres in extent, which in 1881 or the last year ing which there is information numbered 7527, while there 850 between 50 and 300 acres and 15 above 300 acres; 1 2 were above 1000. According to the agricultural returns of he total area of arable land was 76,054 acres or nearly one the whole. Of this 53,515 were under crops, 16,111

permanent pasture, 23,882 rotation grass, only 1407 crops 157 acres were under flax, 2 under hops, 2 under er nursery grounds, and 2744 under woad. Of the corn wheat occupied 18,066 acres, oats 23,347 acres, barley, are chiefly Herefords and cross breeds. Pure Herefords s and a few of the old Montgomery breed are reckoned in 1882 of which 21,912 were cows and heifers in milk or in Horses in 1882 numbered 13,975, of which 7060 were used for agricultural purposes. The county was formerly noted ly breed of small horses called *Merlins*, which are still to th. Many good hunters and cart horses are now bred. The of sheep in 1882 was 305,613. On the mountain land centre and west of the county a diminutive breed of sheep *Welsh* is pastured, but those kept in the better watered the principality Shropshire Down. According to the late the land was divided among 1741 proprietors, possessing 2 acres, with a gross annual rental of £3 . Of these, s 49 per cent. possessed less than one acre of 1000 and 2000 acres, and 2 between 2000 and ng, possessed upwards of 5000 acres, viz. Lord Powis 23,515, W. Wynn 17,963, Lord Sudeley 11,[illegible], J. Naylor 9274, arquis of Londonderry 7400.

nufactures. In all the towns the manufacture of woollen especially Welsh flannel, is carried on, and although the ry was lately on the decline it is now reviving.

ministration and Population. Montgomeryshire comprises hundreds, and the municipal boroughs of Llanfyllin 1121 and pool 6710, Llanfyllin Llanidloes Machynlleth Montgomery, Newtown, and Welshpool form the Montgomery district of ghs, with a total population in 1881 of 19,925, and return one er to parliament. One member is also returned for the county. omeryshire is partly in the dioceses of Bangor, Hereford and ph, and contains sixty-eight civil parishes, town ships, or as well as parts of other parishes in Denbighshire counties. From in 1831 the population had increased to 54,551 to 67,235, and 1 to 67,663, but in 1881 it had diminished to 56,618, of whom were males and 27,714 females.

tory. At the time of the Roman invasion, Montgomery was ed by a tribe of the Cymri called Ordovices. Traces of l of the old British camps still remain, the principal being at Dolarddyn, on Breidden Hill, and at Caereinion. There are large number of cairns and barrows. The county was first by the great Roman road, the *Via Watlingensis*, which was joined number of others, but the remains of Roman camps or stations unimportant. After being vacated by the Romans, little is of the history of Montgomery, until Wales was subdivided ree districts at the death of Rhodri the Great. Montgomery en included under Powys, and formed the chief portion of Gwenwynwyn, sometimes called Upper Powys. Powys or Castle, the seat of the rulers of Upper Powys, was founded in Baldwyn, from which the county takes its Welsh name, was ant of the marches; and, for the purpose of holding the di check, a castle was built about the end of the 11th century, after being captured by the natives, was retaken by Roger ntgomery. He gave his name to the castle, and to the surng district of ancient Powys, which was made a county by VIII. in 1536.

ONTGOMERY, the county town, is situated on the declivi of a well wooded hill near the eastern bank of the n, 21½ miles south by west of Shrewsbury, and 187¾ by rail north west by north of London. It is a cle well built town, but somewhat scattered and irre The principal buildings are the parish church of Nicholas (an old cruciform structure) and the town The borough has returned members to parliament the time of Henry VIII., but by the Reform Act of 1 was constituted one of the Montgomery district of bor which together return one member. The populat ne borough (area, 333 acres) was 1194 in 1881.

here are only s[illegible] mantling remains of the old for Montgomery, originally founded in the time of William th quered to overawe the Welsh, and held by Roger de Monte from whom the town takes its name. The castle was enlarged in the time of Henry III. when it was the scen great contest between that monarch and Llewelyn the Gr the 13th century it was held by the Mortimers, from whom it to the house of York. By the crown it was granted in 1 century to the Herberts of Cherbury, but upon the Civil was surrendered by Lord Herbert of Cherbury to the Parlia for [illegible] by whom it was dismantled.

MONTGOMERY, a district in the lieutenant gov ship of the Punjab, lying between 29° 8′ and 31° 1 lats., and between 72° 29′ and 74° 10′ E. long., is bo on the N.E. by Lahore, on the S.E. by the river on the S.W. by Multan, and on the N.W. by Jhang area 5673 square miles. Montgomery district, fo known as Gugaira, occupies a wide extent of th Doab, or wedge of land between the Sutlej and the beautiful stretching across the latter river into the adj Rechna Doab. In the former tract a fringe of cult lowland skirts the bank of either river, but the interior upland consists of a desert plateau partiall grown with bur, lavi-wood and coarse grass, and in places impenetrable jungle. On the farther side of the again the country at once assumes the same desert

es lie scattered along the river bank, or dot the now barren
s of the central waste, clearly marking the former existence
siderable population. The pastoral tribes of this barren
do not appear to have paid more than a nominal allegiance
ile-lord rulers, and even in later days, when Ranjit Sinh
f the Sikh supremacy as far as Multan, the country yielded
no revenue, and the population for the most part re-
in a chronic state of rebellion. British influence was first
l in the district in 1847, when an officer was deputed to
ummary settlement of the land reve Direct British
ted a ation of Punjab in 1849. The
dent since then was a general rising of the wild clans dur-
mutiny of 1857, several actions being fought bet the
re defeated and dispersed and order restored.

NTGOMERY, a city of the United States, the
of Alabama, is built on a high bluff on the left
the Alabama river, 158 miles north-east of Mobile,
hich it is connected by rail (180 miles) and by a
oat service (330 miles). The State house, rebuilt
l at a cost of $70,000, occupies a commanding
Capitol Hill. There are a city hall, a court house,
o theatres, a large flour mill, a cotton factory, two
s, a fertilizer factory, and several foundries and
e shops. The population was 16,713 in 1880; and,
equence of the marked increase in commercial and
ial activity that date, it is now (1883) esti
at 19,000 ded in 1817, and named after
l Richard Montgomery (1736-75), the town of Mont
became in 1847 the seat of the State Government
of Tuscaloosa. From February 1861 to May 1862
he capital of the Southern Confederation. In 1865
ezed by the Federal forces under General Wilson.

NTGOMERY, Alexander, whose life fell between
nd 1610, was the last of the series of Scottish poets
urished in the 16th century under the patronage of
narchs. With the union of the crowns, and the
rence of James VI. from Edinburgh to London,
favour was withdrawn from Lowland Scotch, it
ally ceased to be a literary language, and no poetry
k was written in the dialect, if we except that of
Ramsay's school, till it reappeared in literature as
strument of the Ayrshire peasant. By a curious
ence, Montgomery seems to have been, like Burns, a
of Ayrshire. A commendatory sonnet from his
xtravagantly flattering, as was the custom of the
as printed with King James's *Essays of a Prentice*
4; he received a pension from the crown a few
ater, fell into disgrace apparently for a time, was
ed in favour, and accompanied his patron to Eng-
As might be expected from the poet of a court
the king himself was a keen critic. Montgomery's
ments poems show a careful attention to form; he
many metrical experiments, and managed many
cated stanzas with skill. The sonnet form, at that
leading fashion in English verse, was also cultivated
Scottish court, and Montgomery's sonnets possess
rable merit. His most successful poem, published
7, and frequently reprinted in Scotland, was the
y of *The Cherrie and the Slae*. The poet, smitten
ad, conceives a longing for some cherries, beautiful
ut growing high up on a steep and dangerous bank,
a roaring waterfall. Shall he climb and win?
and counsel and will urge him to try, dread and
and despair counsel him to be content with the
r fruit of the sloe, which grows within easy reach.
ence, reason, wit, and skill debate the question.
end he resolves to venture for the cherry, with the
help of these last-named powers. The conflicting
s of the poet's adviser are very pithily expressed in
s for and against the adventurous enterprise, and the
tion of the situation is strong and vivid. Mont
y was no unworthy successor to Henryson and
Dunbar in executive finish, but the want of origina
his poems shows that the old impulse was nea
hausted. There are traces of Italian influence
sonnets and love songs, but it was much less po
with him than with his English contemporaries.

MONTGOMERY, James (1771-1854), poet and
nalist, was justly described by Lord Byron, in a fo
to *English Bards and Scotch Reviewers*, as "a man
siderable genius," though it was going far beyond the
to speak of his *Wanderer of Switzerland* (his first
poem, published in 1806) as being worth a th
"Lyrical Ballads." Montgomery was born 4th N
ber 1771, at Irvine in Ayrshire, Scotland. Part of h
hood was spent in Ireland, but he received his edu
in Yorkshire, at the Moravian school of Fulneck,
after the original home of the Moravians, to which s
father belonged. He drifted at an early age into jour
and edited the *Sheffield Iris* for more than thirty
When he began his career the position of a Dissentin
nalist was a difficult one, and he twice suffered impriso
(in 1795 and 1796) on charges that now seem absurdly
and untair. His *Wanderer* was mercilessly ridiculed
Edinburgh Review, but in spite of this Montgomer
lished many poems, which had a wide popularity
West Indies, 1810, *The World Before the Flood*,
Greenland, 1819; *Songs of Zion*, 1822; *The Pelican*
1827. On account of the religious character of his
he is sometimes confounded with Robert Montgomer
much to the injustice of his reputation. The inspirin
of James Montgomery's poetry was the humanitaria
ment which has been such a power in the political
of this century, and the pulse of this sentiment is n
felt beating more strongly than in his verse. His
has thus an historical interest altogether apart fr
intrinsic value as poetry. But this value is far fro
temptible or commonplace. Strictly speaking, Mont
was more of a rhetorician than a poet, but his imag
was bold, ardent, and fertile, and more than one of his
contemporaries owed occasional debts to his vigorous
tion and even to his casual felicities of diction, whi
passages from his poems keep a place in the literatu
is universally read and quoted. At the close of hi
as a journalist, when all parties agreed in payin
respect, he claimed for his poetry that it was at le
imitative, and the claim was just as regarded con
and choice of subjects: but as regards diction and i
the influence of Campbell is very apparent in his
poems, and the influence of Shelley is supreme
Pelican Island, his last and best work as a poe
Lectures on Poetry and General Literature, publis
1833, show considerable breadth of sympathy and
of expression. *Memoirs* of him were published i
volumes in 1856-8. They furnish valuable mater
the history of English provincial politics in th
entury. He died at Sheffield 30th April 1854.

MONTGOMERY, Robert (1807-1855), author
Omnipresence of the Deity (1828), *Satan* (1830), a
Messiah (1832), was the Montgomery ridiculed
nounced in Macaulay's famous essay. As a poet, he d
every word of Macaulay's severe censure; the m
intellectual feebleness—tautologous epithets, a
mixed metaphors, and inapt lines introduced for t
of rhyme are visible in every page of his versi
It should be mentioned that Macaulay's "trouncin
not diminish the sale of his so-called poems; one
works expressly ridiculed reached its 28th edition i
His real name is said to have been Gomery.

Calendar.

MONTILLA, a small and unimportant city of S

province of Cordova, 32 miles to the south of the city Cordova, on the Malaga railway, is strikingly situated on hills which command a beautiful and extensive prospect the surrounding country. The manufactures (princi- y weaving) are unimportant, and the trade of the place iefly in agricultural produce. The oil of the surround district is abundant and good; and it is the peculiar our of the pale dry light wine of Montilla that gives ame to the sherry known as Amontillado. The popu on in 1878 was 13,207. Montilla was the birthplace "The Great Captain," and still shows the ruins of the le of his father, Don Pedro Fernandez de Cordova.

MONTLUC, Blaise de Lasseran Massencome, Sieur de (c. 1503–1577), marshal of France, was born at 1503, at the family seat near Condom in the lern department of Gers. He was the eldest son, and family was a good one, but it was large and poor, and, most gentlemen of Gascony, he had to trust for endow- t to his sword. He served first as a private archer and -at-arms in Italy, with Bayard for his captain, fought through the wars of Francis I., and was knighted on field of Cérisoles (1538). Having apparently enjoyed patronage, he was by this time a man of middle age. neeforward, however, his merits were recognized by his ointment to various important posts. His chief feat was famous defence of Siena (1555), which he has told so irably. When the religious wars broke out in France, ntluc, a staunch royalist, held Guienne for the king, excreised severe but impartial justice on Catholics and testants alike. He would have nothing to do with the ssacre of St Bartholomew. Henry III., however, made marshal of France, an honour which he had earned by rly half a century of service and by numerous wound- died at Estillac near Agen in Montluc's commen- ve other soldiers of fortune in his day is due to his *mmentaires* (Bordeaux, 1592), in which he described y years of service. This book, the "soldier's Bible" (or reviary," according to others), as Henry IV. called it, is of the most admirable of the many admirable books of noirs produced by the unlearned gentry of France at that e. It is said to have been dictated, which may possibly ount in some degree for the singular vivacity and turesqueness of the style. Hardly any author excel- ntluc in the clearness with which he brings military rations before the reader. As with most of his con- poraries, his work is didactic in purpose, and he often ses to draw morals for the benefit of young commanders. never tediously. The eloquence displayed in some of speeches is remarkable. These *Commentaires* are to be nd conveniently in the collection of Michaud and joulat, but the standard edition is that of the *Société l'Histoire de France*, edited by M. de Ruble (5 vols. 5-72).

MONTLUÇON, the industrial capital of the centre of nce, sometimes called the French Manchester, is the d of an arrondissement, and the largest town (26,079 abitants in 1881) of the department of Allier. The per town consists of steep, narrow, winding streets, and serves several buildings of the 15th and 16th centuries; lower town, traversed by the river Cher (there convey- o a canal communicating with that along the Loire), is seat of the manufacturing industries, which embrace ss, steel, and iron works, lime-kilns, saw mills, and a ol-spinning factory. The Commentry coal mines are y a few miles distant. There is railway connexion with ulins (50 miles to the east-north-east), Bourges, Limoges, Clermont-Ferrand, and a new line is about to be opened Tours *via* Chateauroux. Of the churches, Notre Dame f the 15th century, St Pierre partly of the 12th, and St l modern. The town-hall, with a library, occupies the site of an old Ursuline convent, and two other conven serve as college and hospital.

Montluçon, which existed as early as the 10th century, w by the English in 1171 and by Philippe Auguste in 1181, the were beaten under its walls in the 14th century. The castle by Louis II., duke of Bourbon, was taken by Henry IV. du religious wars; at present it is occupied as a barracks.

MONTMORENCY, the name of one of the old most distinguished families in France, is derive Montmorency, now in the department of Seine et O the immediate neighbourhood of Enghien and St and about 9 miles to the north-north-west of Paris family, since its first appearance in history in the pe Bouchard or Burchard I., sire de Montmorency in th century, has furnished six constables and twelve m of France, several admirals and cardinals, numerous officers of the crown and grand masters of various k orders, and was declared by Henry IV. to be after the Bourbons, the first house in Europe. Mathieu de Montmorency, received in 1138 the post of constab died in 1160. His first wife was Alix, the natural da of Henry I. of England; his second, Adelaide or A Savoy, widow of Louis VI. and mother of Louis According to Duchesne, he shared the regency of with Suger, during the absence of the latter king second crusade. Mathieu II. had an important in the victory of Bouvines (1214), and was made constable in 1218. During the reign of Louis (1223–1226) he distinguished himself chiefly in the of La Saintonge, Rochelle, Bordeaux). On the ac of Louis IX. he was one of the chief supporters of the regent Blanche of Castile, and was successful in re all the vassa led in 1230. His y son, Guy, in right of his mother became head of the h Montmorency-Laval. Anne de Montmorency (1493 so named, a friend, and, after his godmother Anne of B to the first attain the head title. He was Chantilly in 1493, and was brought up with the d afterward Francis I. whom he followed into Italy in distinguishing himself especially at Marignano. I he became governor of Novara; in 1520 he was pre the Field of Cloth of Gold, and afterwards had ch important negotiations in England. Successful defence of Mezières (1521) and a commander of th troops in the Italian campaign of the same year, made marshal of France in 1522, accompanied Fran Italy in 1524, and was taken prisoner at Pavia in Released soon afterwards, he was one of the negotia the treaty of Madrid, and in 1530 reconducted the sons into France. On the renewal of the war by Francis invasion of France in 1536 Montmorency co the emperor to raise the siege of Marseilles; he afte accompanied the force of France into Picardy, and termination of the Netherlands campaign marched rebel of Ghent. In 1538 to the ratification of year truce, he was rewarded with the office of co but in 1541 he fell into disgrace, and did not re public life until the accession of Henry II. in 15 1548 he repressed the insurrections in the sou particularly at Bordeaux, with great severity, and i Piedmont conducted the war in the Boulonnais, necessit tedly for the surrender of Boulogne on 24th Marc In 1551 his barony was erected into a duchy. Sub wards his armies found employment in the north connexion with the seizure of Metz, Toul, and Ver the French king. His attempt to relieve St Quentin in his defeat and captivity (10th August 1557) and not regain his liberty until the peace of Cateau-Cam in 1559. Supplanted in the interval by the Guises, treated with coldness by the new king, Francis compelled to give up his mastership of the roya

his son, however, being appointed marshal by way
mnity. On the accession of Charles IX. in 1560
ned his offices and dignities, and, uniting with his
enemies, the Guises, played an important part in the
ot even of 1562. Though the arms of his party
ictorious at Dreux, he himself fell into the hands
enemy, and was not liberated until the treaty of
19th March 1563). In 1567 he again triumphed
, but received the death blow of which he died
terwards at Paris. His eldest son, FRANÇOIS de
orency (1530-1579), was married to Diana, natural
r of Henry II., another son, HENRI I. de Mont-
(1531-1614), was constable of France from 1593
II. (1595-1632), son of duke Henry I., succeeded to
e in 1614, having previously been raised by Louis
the office of grand admiral. In 1625 he defeated
ch Protestant fleet under Soubise, and seized the
of Rhé and Oléron, but the jealousy of Richelieu
d him of the means of following up the advantages.
1629 he was allowed to command against the duke
ne in Languedoc; in 1630 he defeated the Piedmon-
d captured Prince Doria at Avigliana, and took
. In the same year he was created marshal. In 1632
d the part of Gaston duke of Orleans, and placed
at the head of the rebel army, which was defeated
shal Schomberg at Castelnaudary (1st September
severely wounded he fell into the enemy's hands,

STORGA, a town of Spain in the province of Corunna
s to the north-north-east of that city, on the Madrid
, stands on a rocky peninsula on the south bank of
adalquivir, here crossed by a fine bridge of four arches
from the 16th century. It is a fortified place, and
hospital, and is one of the best in Andalusia.
st important article of commerce is the oil of the
ding district. The population of the ayuntamiento
293 in 1878.

STPELIER, a town of the United States, the capital
ont since 1805, and the county seat of Washington
since 1811), is situated in 44° 17′ N. lat. and 72°
ong., on the Winooski or Onion river, which falls
ke Champlain. It has a station on the Central
t Railroad and is the western terminus of the
ber and Wells River and the Montpelier and White
Railroads. The State house, in the form of a Greek
th a dome and Doric portico, was erected at a cost
000, to replace the structure burned down in 1857;
the portico stands a marble statue (by Larkin G.
Ethan Allen (1737-1789), the hero of Vermont.
te library contains 20,000 volumes. From 2311
the population had increased to 3219 in 1880.

TPELLIER, chief town of the department of
Hérault, is situated at the junction of several
lines on a small hill rising above the Lez, at its
ce with the Mediterranean, about 480 miles south of
and about 7 miles from the Mediterranean, from
it is separated by the Etangs of Pérols and l'Arnel.
headquarters of the 19th corps d'armée, as the seat
shop of a university and of a court of appeal,
lier is the principal place of lower Languedoc. The
n Peyrou, 675 feet in length by 410 in breadth,
the finest squares in France, occupies the highest
the town, and terminates in a terrace, commanding
ficent view of the coast of the Mediterranean, and
le stretch of country reaching to the Cevennes on
th, to the spurs of the Pyrenees on the south-west,
hose of the Alps on the north-east. On the terrace
ted the reservoir of the town, the water being
brought from a distance of 5 or 6 miles by an aqu
of two tiers of arches, about 70 feet in height. I
centre of the square is an equestrian statue of Louis
To the right and left are promenades, off which the
boulevards converge. The Boulevard Henri IV. to
north leads to the botanical garden, medical college
cathedral; to the east the Rue Nationale leads to
palace of justice, the préfecture, and the citadel. The c
dral, which until 1536 was the church of a Benedi
monastery, suffered severely during the religious wars
about thirty years ago it was restored in the style o
13th century. It has four towers, and is one of the la
churches in southern France, being more than 300 fe
length, 92 in breadth, and 88 in height. The monas
after being converted into the bishop's palace, has
1795 being occupied by the famous medical school

Connected with the medical school is an anatomical mu
and a rich library. Montpellier also possesses a fa
of science, with several fine collections, a faculty of le
a higher school of pharmacy, an agricultural college
a sericultural institute. The museum contains more
600 paintings, in addition to collections of marbles, bro
and antiquities. The botanical garden, more than 10
in extent, is the oldest in France, having been lai
in 1593. The esplanade, ornamented by fine old
planted by the duc de Roquelaure, formerly gov
of Languedoc, leads towards the citadel. The inner cit
narrow and tortuous streets, but many good houses. A
the public buildings, the principal are the palace of ju
a modern structure, the façade adorned with statu
the statesman Cambacérès and of Cardinal Fleury
barracks, several hospitals, the juvenile seminary, and
central prison for females. There are several le
societies, including an academy of science and lette
antiquarian society, several medical societies, and
for various separate branches of study, including
dialect of Languedoc. The Lez has been deepened
widened so as to connect Montpellier with the Can
Midi and with the sea at Palavas. The town
a considerable trade in wine and brandy. The prin
industrial establishment is a manufactory for wax-ta
candles, and soap, doing business to the amount of £40
per annum. There are also chemical works, cooper
distilleries, &c. The population in 1881 was 56,005.

Montpellier first rose into importance after the destruct
Maguelone by Charles Martel in 737. Its prosperity dates
the beginning of the 12th century, when its school of me
(vol. xv. p. 807) first began to acquire fame. It had a
of law in 1160, and a university was founded by Pope Nichol
in 1289. St Louis (Louis IX.) granted to the town the ri
free trade with the whole of the kingdom, a privilege which g
increased its prosperity. In 1204 Montpellier became a depen
of the house of Aragon, through marriage, and in 1350 it wa
to Philip of Valois. In the time of Charles VIII. it is said to
had 15,000 hearths. It took the place of the bishopric of M
lone in 1536. At the time of the Reformation it became
the most important centres of Protestantism, but was tak
Louis XIII., who erected the citadel commanding the

MONTPENSIER, ANNE MARIE LOUISE D'ORL
DUCHESSE DE (1627-1693), one of the most remar
names on the somewhat arbitrary list of royal and
authors, was born at the Louvre on 29th May 1627.
father was Gaston of Orleans, "Monsieur," the broth
Louis XIII., celebrated for the invariable ill fate
attended his favourites and partisans. Her mother
Marie de Bourbon, heiress of the Montpensier family.

of the blood-royal of France on both sides, and an
s to immense property, she appeared to be very early
ed to a splendid marriage. It was perhaps the greatest
tune of her life that "Mademoiselle" (as her courtesy
ent) was encouraged or thought herself encouraged
k forward to the throne of France as the result of a
gle with Louis XIV., who was, however, eleven years
nior. Ill-luck, or her own wilfulness, frustrated
ous plans for marrying her to various persons of more
s exalted station, including Charles II. of England,
Prince of Wales. She was just of age when the Fronde
out, and, attributing as she did her disappointments
zarin, she sympathized with it not a little. It was
oyever, till the new or second Fronde that she dis-
d in a very curious fashion a temper and courage as
line and adventurous as those of her father Gaston
ways been effeminate and timid. She not only took
al command of one of the armies on the princes'
out she literally and in her own person took Orleans
alade, crossing the river, breaking a gate, and mount
e walls with the applause of the populace of the city,
face of the refusal of the authorities to admit her.
od result, however, came to her party from this
rdinary act, and she had to retreat to Paris, where
ractically commanded the Bastille and the adjoining
of the walls. On the 2d of July (1652) the battle
Faubourg Saint Antoine, between the Frondeurs
Condé and the royal troops under Turenne, took
and the former, being beaten, found themselves in
kward situation, between their conquerors and the
of a city, which, though not exactly hostile to them,
ot nominally on their side, and had closed its gates
st them. Mademoiselle saved them by giving orde
herely for the gates under her control to be opened
r the cannon of the Bastille to fire on the royalists,
was done. Her own residence (and indeed her pro
was the Luxembourg, and here she found herself
g the riots which followed the battle, but in the
of the *émeute* she installed herself in the hôtel de
nd played the part of mediatrix between the opposed
s. Her political importance lasted exactly six months,
id her little good, for it created a lifelong prejudice
st her in the mind of her cousin, Louis XIV., who
forgave opposition to his sovereign power. Nor
he any support to look for from her pusillanimous
, who hastened to make terms for himself,—a matter
ss difficult that his known faithlessness had pre-
l the chiefs of the Fronde from engaging him at
eply in their schemes. Mademoiselle, on the other
was for some years in disgrace, and resided on her
s. It was not till 1657 that she reappeared at
but, though projects for marrying her were once
set on foot, she was now past her first youth. Her
able self-will, moreover, still stood in her way, and
after suitor was rejected for reasons good or bad.
was nearly forty, and had already corresponded
sly with Madame de Motteville on the project of
ishing a ladies' society "sans mariage et sans amour,"
a young Gascon gentleman named Puyguilhem,
wards celebrated as M. de Lauzun, attracted her at
It was some years before the affair came to a crisis.
t last, in 1670, Mademoiselle solemnly demanded the
permission to marry Lauzun. Madame de Sevigné's
on this occasion is one of the most famous of her
tion. Louis, who liked Lauzun, and who had been
ted by Mazarin in the idea that Mademoiselle ought
be allowed to carry her vast estates and royal blood
y one who was himself of the blood royal, or even to
oreign prince, gave his consent, but it was not imme-
y acted on. The pride of the other members of the royal family, and the spite of the king's brother, Mo
who had, after the death of Henrietta of England
offers to his cousin, prevailed with Louis to reser
permission. Not long afterwards Lauzun, for a
cause, was imprisoned in Pignerol, and it was years
Mademoiselle was able to buy his release from the k
settling no small portion of her estates on Louis's ba
The elderly lovers (for in 1681, when Lauzun was re
he was nearly fifty, and Mademoiselle was fifty four
then secretly married, if indeed they had not gone th
the ceremony ten years previously. But Lauzun, a
and brutal adventurer, tyrannized over his wife, an
spirit, which was yet unbroken, at length got the bette
passion. It is said that on one occasion he address
thus, "Louise d'Orleans, tire moi mes bottes," and th
at once and finally separated from him. She lived
ever, for some years after he had achieved his last
ture (that of assisting the family of James II. to
from England, and attempting to defend their ca
Ireland), gave herself to religious duties, and finish
Mémoires, which extend to within seven years of her
(9th April 1693), and which she had begun when s
in disgrace thirty years earlier. These *Mémoires* (A
dam, 1729) are of very considerable merit and in
though, or perhaps because, they are extremely ego
and often extremely derogatory. Mademoiselle write
out art, but with the hereditary ability of her fami
the strongly personal view which she takes of public
is rather an advantage than a disadvantage. They
be found in the great collection of Michaud and Pou
and have been frequently edited apart (G.

MONTREAL, the largest in the Domi
Ca a, its at of and principal
entry, is situated on an island of about 30 miles in
and 7 in breadth, at the confluence of the rivers
and St Lawrence, 45° 30′ N. lat. and 73° 32′ W
It stands at the head of ocean navigation, 160 miles
Quebec, and nearly 1000 miles (980) from the A
Ocean, and lies at the foot of the great chain of
lake, and canal navigation which extends westward t
the great Lakes. Montreal is built upon a ridge of t
the former levels of the river on or at a more ancien
Behind those rises Mount Royal, a mass of trap rock
up through the surrounding lime-stone strata to a he
700 feet above the level of the river. From this r
city derives its name, though its original founder,
Chomedey, sieur de Maisonneuve, in 1642, gave it th
of Ville Marie, where it was d with religious
sism, not as a centre of commercial enterprise, but
seat of a mission which aimed especially at the conver
the native Indians. The modern city of Montreal c
an area of about eight square miles, its principal
running parallel with the river. On the north side
Mountain the Trenton lime-stone approaches the s
and is there quarried for building purposes. Of th
limestone most of the public offices and many of th
class of private dwellings are built. But both bu
wood are largely used for workshops and private h
a humbler class. The western slope of the Moun
occupied by the Côte des Neiges (Roman Catholic
tery, and the Mount Royal (Protestant) cemetery
upper portion of the Mountain, embracing an area
acres, is now laid out as a public park, with tre
shaded by well grown tre From its commandi
and the wide expan e of the valley of the St La

e constructed with a view to resist the enormou
e of the ice in spring. Near at hand the tower
and dome of numerous churches and public build
s from the general mass of houses. The wharves
ke are crowded with shipping during the season of
tion, for the St Lawrence is navigable to Montreal by
ocean steamers. But immediately above the
river is impeded by a natural dyke of trap and
ne which here arc s the waters in their descent,
g the Lake St Lou at a height of 11 feet above
of M d harb The h
rough a channel of about half a mile wide, with
dity of about 18 miles an hour, forming the Lachine
Louis Rapid Owing to the immense volume of
concentrated in a narrow channel, steamers drawing
t of water are safely navigated down the rapids,
are necessarily present an insuperable barrier to the
of the river The is accordingly surmounted by
of the Lachine Canal, which, commencing at the
f Montreal, passes round the falls by a series of
n a course of nine mile s, to Lake St Louis, opposite
dian village of Caughnawaga The fall of water
in the canal furnishes water-power for saw-mills, boi
engine works, sash, blind, door, edge-tool, and
factories, established on its banks. Sugar refini
also been carried on here with great profit. Wool
cotton mills, silk factories, a large rubber factory, ro
cordage works, boot and shoe factories, &c., are l
organized on an extensive scale. The water sup
Montreal is derived from the river above the city
after passing along an open canal 5 miles in len
is raised to a reservoir excavated out of the solid r
the east slope of the Mountain, 205 feet above the
the harbour.

The circumstance attendant on the foundation of Montr
the marked contrast on its mixed population of French and
give a peculiar character to its religious and benevolent insti
This has led to the multiplication of churches, colleges, c
and religious and charitable foundations, and to a rivalr
zeal of their promoters one result of which is seen in the s
imposing character of many of their buildings. The Metr
Cathedral of St Peter, designed to reproduce on a reduc
the chief features of St Peter's at Rome, was projected by
Bourget after the destruction of his church and palace in t
fire of 1852. It occupies a prominent site in Dorchester
at the corner of Dominion Square; and, when surmounte
projected dome and finished in front with its classic façade
form a striking feature in the general view of the cit
parish church of Notre Dame, on the Place d'Armes,
accommodation for 10,000 worshippers. The Jesuits' Ch

Foremost among the educational institutions is the univ
M'Gill College, founded by James M'Gill, a Scotchman, wh
later years of the 18th century engaged in the north-west f

d ultimately became one of the leading merchants in Montreal t his death in 1813 he left his property for the founding of a col ge. The most recent and liberal addition to it is the Peter Red- ath Museum, valued at upwards of $100,000, the gift of a wea tizen. The university embraces the faculties of arts, law, and edicine, and has also a department of practical science. The ollege buildings stand in a pleasant park fronting on Sherbrooke treet, at the base of the Mountain. Theological colleges in con ection with the Church of England, the Presbyterian, Methodist, d Congregational Churches, occupy buildings in the vicinity, and eir students attend the classes at M'Gill College for secular instruc- on. The Seminary of St Sulpice is a theological training school r priests, where the larger portion of the Roman Catholic clergy the province of Quebec have received their training, and also a ollege where a large number of the French Canadian youth obtain eir education. This seminary is held in high esteem, and attracts any Roman Catholic students from the United States. Laval niversity, which has its chief seat at Quebec, has also a branch Montreal, with a large staff of professors, chiefly in theology, w, and medicine. The M'Gill and the Jacques Cartier Normal chools for training teachers for the Protestant and Roman Catholic ublic schools are conducted under the Protestant and Roman atholic boards of public instruction, and model schools attached them afford the requisite practical training for teachers. The incipal public monuments are the column erected in honour of rd Nelson, and a bronze statue of Queen Victoria, by the late arshall Wood, which occupies a good site in Victoria Square.

The commerce of Montreal is well represented by the architec- ral character of its banking establishments and many of the fine ercantile houses. It is also the seat of a large manufacturing dustry. But the most substantial evidence of its importance as commercial centre is its harbour. The solidly built basins, harves, quays, and canal locks extend for upwards of a mile and half along the river-side. In 1849, at a period of depression, the tal value of the imports and exports amounted to £2,013,478 sterling. In 1880 they had risen to £15,633,607 sterling. The usiness of the port at the same date in the export of Canadian rrency, total value of export $26,531,312, of import $49,749,461 stoms duties collected estimated at $8,100,000. The number of a-going vessels in port was 648, of which fully one half were ocean rriers; in addition to which the inland vessels arriving at the ort numbered 6543. The estimated value of real estate in Montreal $65,978,930. The population in 1881 numbered 157,715; in 1 had increased to 140,747, of whom 78,681 were of French and 8,995 of Irish origin. Of the whole number, 103,979 were Roman atholics.

The city returns three members to the Canadian House of ommons, and the same number to the provincial legislature of uebec.

When the first French explorers landed on the island of Montreal nder the leadership of Jacques Cartier in 1535, a large Indian alisaded town existed a little to the west of Mount Royal, and not r from the present English cathedral. To this fortified town the ndians gave the name of Hochelaga, and Jacques Cartier describ as surrounded by fields of grain and other evidences of a settled ative population. The name is now applied to the eastern suburb f the modern city. Sixty years later, when Samuel de Champlain ade his way up the St Lawrence, and climbed to the summit of Mount Royal, the populous native town had disappeared, and only wo Indians were found from whom some obscure hints were derived f war between rival tribes, followed by the destruction of the town nd the extermination or flight of its former occupants. The enmity hus established between the Wyandotts or Hurons of Canada and he Iroquois settled in the valley of the Hudson and south of Lake Ontario was perpetuated throughout the whole period of French ccupation. Champlain took the side of the Hurons, while roquois allied themselves with the Dutch and English settlers on he Hudson. Thus the early history of Montreal is largely occupied ith incidents of Indian warfare. In 1665 the marquis de Tracy rrived from France, bringing with him a regiment of French oldiers, with whose aid the Indian assailants were driven off, and orts erected and garrisoned to repel their incursions, thus ected, Montreal became the centre of the fur trade with the west, nd entered on its history as a commercial city. In 1722 it was ortified with a bastioned wall and ditch, under the directions of De Lery; and the citadel was erected on a height now laid out as alhousie Square. The taking of Quebec by the English under eneral Wolfe in 1759 was followed ere long by the surrender of ontreal. Since that date it has rapidly developed as an impor- ant centre of commercial and manufacturing enterprise. (D. W

MONTROSE, a royal and parliamentary borough and seaport of Forfarshire, Scotland, is situated on the German Ocean at the mouth of the South Esk, on a branch of the Caledonian Railway, 30 miles east-north-east of Dundee, and 38 south-south-west of Aberdeen. Its harbour basin, formed by the estuary of the South Esk, has an about 4 square miles, and is dry at ebb tide, but water there is a depth of about 18 feet at length of the quays and docks is about 1½ miles South Esk is crossed by a suspension bridge here 1829 at a cost of £20,000, and having a length fr points of suspension of 122 feet (with its approach feet). On the links to the east of the town is one finest golfing greens in Scotland. In the High which is of considerable width, and contains sever lofty houses, there are monuments to Sir Robert Peel Joseph Hume, formerly member for the Montrose bo The principal buildings are the parish church one largest churches in Scotland, the town house, the mu and the academy. There is a public library with volumes, and a mechanics' library with 7000 v Besides the staple industry of flax-spinning, the manufactures of linen, sailcloth, sheetings, stare soap, iron foundries, tanning, and brewing are also on. The export trade is chiefly in manufactured agricultural produce, and fish, the principal impo timber and coal. In 1881 the number of ship entered coastwise was 373 of 18,898 tons, the numb cleared 250 of 21,877 tons, the number engaged foreign and colonial trade in the same year was 108 of 31,868 tons, cleared 12 of 10,359 tons. M is also one of the principal fishing stations in Scotla number of registered boats in 1881 being 347 tons, giving constant employment to 697 persons, a sional employment to 300. Montrose joins with A Brechin, Forfar, and Inverbervie in returning one to parliament. The population of the royal burgh as 15,720, and 16,980 in 1881, the population parliamentary burgh in the same years was 14,1 14,975.

Montrose received a charter from David I. in the 12th and was made a royal burgh by David II. in 1357. The destroyed by fire in 1241. It was on the port of Mont Sir James Douglas in 1330 embarked for the Holy Land heart of Bruce, not that Prince Jane Stuart "the Old Pr set sail on 1716 for France after the failure of his enterprise The town and the Erthbride of Andrew Melville, of the great of Montrose, and of Joseph Hume.

MONTROSE, JAMES GRAHAM, MARQUIS OF, 1650), born in 1612, became the fifth earl of Mont his father's death in 1626, educated at St A and in 1629, at the early age of seventeen, he Magdalene Carnegie, daughter of the earl of South 1636, on his way home from a prolonged visit to the rest, he sought an introduction to Charles I., but, as i was frustrated in his hope of obtaining the king's fa an intrigue of the marquis of Hamilton. Not lo the outbreak of the Scottish trouble in 1637 h the party of resistance, and was for some time energetic champion. He had nothing puritanical nature, but he united in the ill feeling aroused Scottish nobility by the political authority g Charles to the bishops, and in the general indign he king's ill-judged scheme of imposing upon Sc liturgy which had been drawn up at the instigatio English court, and which had been corrected in by that Archbishop Laud who now became known land under the nickname of "the pope of Can Montrose's chivalrous enthusiasm eminently qualifie be the champion of a national cause, and the resi Scotland was quite as much national a it was r He signed the Covenant, and became one of the Covenanters. The part assigned to him was the sion of the opposition to the popular cause whi around Aberdeen and in the country of the Gordons times, in July 1638, and in March and June 1639.

Aberdeen, where he thoroughly succeeded in effect- object, on the second occasion carrying off the the Gordons, the marquis of Huntly, as a prisoner burgh.

ly 1639, after the signature of the treaty of , Montrose was one of the Covenanting leaders ated Charles upon the borders. This change of n his part is frequently ascribed to the fascination ng's conversation. In reality it arose from the t his own convictions. He wished to get rid of ops without making presbyters masters of the His was essentially a layman's view of the situa aking no account of the real forces of the time, d at an ideal form of society in which the clergy confine themselves to their spiritual duties, and in e king, after being enlightened by open communi ith the Scottish nation, should maintain law and thout respect of persons. In the Scottish parliament et in September, Montrose attempted to carry out cy, and found himself in opposition to Argyll, who ed himself at the head of the Presbyterian and party, which, by an alteration of the rules that erto regulated the selection of the Lords of the , gave supremacy in parliament to the representa- the middle classes. Montrose, on the other hand, to bring the king's authority to bear upon parlia- defeat this object, and offered him the support of number of the nobles, who were by this time as pposed to the predominance of the Presbyterian eting upon the middle classes as they had before posed to the predominance of the bishops. He Because Charles could not even then consent to the bishops, and because no Scottish party of any ould be formed unless Presbyterianism were estab ecclesiastically.

r than give way, Charles prepared in 1640 to in otland. As usual, he prepared difficulties for those shed to support him. Montrose was of necessity to play something of a double part. In August signed the Bond of Cumbernauld as a protest the particular and direct practising of a few in ords, against the ambition of Argyll. But he took e amongst the defenders of his country, and in the onth he was the first to wade across the Tweed at l of the invaders of England. After the invasion n crowned with success, Montrose still continued sh his now hopeless policy. On 27th May 1641 ummoned before the Committee of Estates charged trigues against Argyll, and on 11th June he was ed in Edinburgh Castle. When Charles visited l to give his formal assent to the abolition of acy, Montrose communicated to him his belief that n was a traitor. It has indeed been alleged, on 's authority, that he proposed to murder Hamilton vii; but this is in all probability only one of Claren ony blunders. His letters to Charles, however, taken in connexion with this so-called incident, the progress of the investigation of this plot. Mon mained in custody, and upon the king's return to l he shared in the amnesty which was tacitly accorded harles's partisans.

time Montrose retired, not voluntarily, from public fter the Civil War in England began he constantly Charles to allow him to make a diversion on Scot At last in 1644, when the Scottish army entered l to take part against the king, Montrose, now a marquis, was allowed to try what he could do. out to invade Scotland with about 1000 men. But wers deserted, and his condition appeared hopeless. however, inspired him with courage. Disguised as a groom, he, with only two gentlemen, started on 18t August to make his way to the Highlands. No enterpris might seem rasher. Highlanders had never before bee known to combine together, but Montrose knew that mos of the clans detested Argyll, not because they were royalis but because Argyll, as the head of the Campbells, was th chief of an aggressive and unscrupulous tribe. Montros did not miscalculate his chances. The clans rallied to hi summons. About 2000 Irish had crossed the sea to assis him. He won battle after battle. He defeated the Cove nanters at Tippermuir on 1st September, and at the Bridg of Dee on 12th September. Rapidity of movement was th distinguishing feature of his generalship. He crossed th mountains deep with a winter's snow into the country Argyll, burning and destroying as he rested for a tim from more active operations. On 2d February 1645 h crushed the Campbells at Inverlochy, whilst the head the house, who was no warrior, looked on at the disast from a boat. The Scottish parliament declared Montros to have forfeited his life and estate as a traitor, but it coul not reach him to execute the sentence. On 19th Februar he captured Elgin, through March he was ravaging Abe deenshire and Kincardineshire, on 3d April he storme Dundee, then on 9th May came the victory of Auldearn, o 2d July the victory of Alford, and on 15th August the gre victory of Kilsyth. Never till after this battle had Mo trose ventured far from the Highland hills. The High landers had the habit of running home after a victory t secure their booty. Now, however, Montrose found himse apparently master of Scotland. In the name of the kin who now appointed him lord lieutenant and captain-genera of Scotland, he summoned a parliament to meet at Glasgo on 20th October, in which he no doubt hoped to reconci loyal obedience to the king with the establishment of non-political Presbyterian clergy. That parliament neve met. In England Charles was in evil case. He had bee defeated at Naseby on 14th June, and Montrose mu come to his help if there was to be still a king to proclai He never had a chance of knowing what Montrose cou do against the "new model" army. David Leslie, the be of the Scottish generals, was despatched against Montros to anticipate the invasion. On 12th September he ca upon Montrose, deserted by his Highlanders and guarde only by a little group of followers, at Philiphaugh. H won an easy victory. Montrose cut his way through t the Highlands; but he failed to reorganize an army. O 3d September 1646 he embarked for Norway.

Montrose was to appear once more on the stage of Sco tish history. In June 1649 he was restored by the exile Charles II. to his nominal lieutenant-governorship of Sco land. In March 1650 he landed in the Orkneys to tak the command of a small force which he had sent on befo him. Crossing to the mainland, he tried to raise the clan but the clans would not rise, and on 27th April he w surprised and captured at Corbiesdale in Ross-shire. C 18th May he entered Edinburgh as a prisoner. On th 20th he was sentenced to death by the parliament, and h was hanged on the 21st, with Wishart's laudatory biograph of him put round his neck. To the last he protested th he was a real Covenanter and a loyal subject. "The Cov nant which I took," he said, "I own it and adhere to i Bishops, I care not for them; I never intended to advan their interest." Something, at least, of Montrose's dream so impossible to realize at that time, has been realized Scotland. Scotland has remained ecclesiastically Presb terian. The political legality which Montrose wished uphold against factions by means of the king has be upheld by means of the political ripeness of the Scotti nation itself. (S. R. G.)

MONT ST MICHEL, a curious rocky islet, consisti

nass of granite about 3000 feet in compass and 165 in height, rises at a distance of nearly a mile from hore in the bay of St Michel, near the mouth of the snon, at the vertex of the angle formed by the coasts rittany and Normandy. The quicksands by which it rrounded, and which stretch far to seaward, are ex l at low water, and highly dangerous to those who re on them without a guide. Recently efforts at nation have been made, and among t other works a way has been constructed connecting Mont St Michel the nearest point of the mainland (near Moidrey); unfortunate consequence of these operations has been some portions of the ramparts of the island have been ed by the altered tidal currents. The fortress-abbey, hich the rock owes its fame, stands upon the more ptuous side towards the north and we t, the sloping n towards the east and south is occupied by dwellings. The strong machicolated and turreted wall by the whole is surrounded is pierced only by a single way. The northward wall of the abbey (La Merveille), g from the 13th century, is of remarkable boldness, 246 feet in length and 108 feet in height, is sup d by twenty buttresses, and is pierced by a variety of ngs. The single street of the island, leading from ne gateway up to the donjon of the fortress, is lined houses, most of them used as lodging houses by rs and pilgrims; it contains an old parish church, the house of Du Guesclin is also pointed out. The y consists principally of two parallel buildings of stories each, that on the east containing hospitium, ory, and dormitory, and that on the west the cellar, nts' hall, and cloister. The knights' hall is a superb of Gothic architecture, measuring 85 feet by 59, three rows of richly-ornamented pillars. The cloister e of the purest and most graceful works of the 13th ry (1228). The church has a number of imperfect ts, and is surmounted by a square tower of the 17th ry, with a statue of St Michael, which was crowned 77. The nave, which dates from the 11th century, is an; but the choir, which collapsed in 1421, has been lt in the flamboyant style. Beneath is a fine crypt.

nt St Michel was a sacred place even in the time of the Druids ame a seat of Christian worship in the 8th century, when a stery was founded upon it (with the usual miraculous accom nents) by St Aubert, bishop of Avranches. It soon became urite resort of pilgrims, not only from all parts of France, but rom Great Britain and Ireland, and even from Italy. It was ered by the Normans, but Rollo on his conversion, made ation. At the time of the Conquest it supplied William of andy with six ships, and received a considerable share of the sh spoils. About this time the monks began to give them to learning and to collect a large library, and in the 12th ry the establishment reached its highest prosperity. It was by the troops of Philip Augustus, who afterwards furnished sums for its restoration (La Merveille). St Louis (Louis IX a pilgrimage to Mont St Michel, and was afterwards very liberal During the hundred years' war it offered a memorable resist to the English; and here, on 1st August 1469, Louis XI uted the order of St Michel, and held a brilliant chapter. A r celebration was held by Francis I. During the religious the Huguenots made repeated unsuccessful attempts to sca rtress; it opened its gates to Henry IV. after his abjuration. 1615 the Benedictine monks of Mont St Michel were re by monks of the Congregation of St Maur; after the Revolu he abbey was used as a prison for political offenders. It is n historical monument; it contains an orphanage, and is under repairs.

ONTSERRAT, one of the Leeward Islands in the Indies, situated 16° 45′ N. lat. and 62° 7′ W. long., miles long and 8 broad in its widest part, and has an of 32 square miles. The uneven and rugged surface asts possibly volcanic origin. Its general appearance ry picturesque, the most interesting natural feature the Souffrière. The island was discovered by mbus in 1493, and received its name either because of its broken appearance or after the mountain in It was colonized by the English under Sir Thomas W in 1632, and was taken by the French in 1664. Re to the English in 1668, it capitulated to the Fre 1782, but was again restored in 1784. It is now sidency under the general government at Antigua, a a legislative council, composed of officials and crown nees. The climate is the most healthy in the West The population (10,087) consists principally of n with several hundred whites. The revenue and ex ture average £5600 per annum. Sugar exports rang 1200 to occasionally 2000 tons. An important in is the cultivation of limes and the manufacture of About 700 puncheons of raw lime juice, 300 hogshe concentrated juice, and an increasing quantity of fresh limes are exported annually. For the three years 1880 the average value of imports was £26,390, of e £32,963. The principal town is Plymouth, lying n along the south west coast.

MONTSERRAT. Thirty miles to the north w Barcelona in Spain there rises a very remarkable mo of grey conglomerate, 24 miles in circumference, and lofticst point (San Geronimo) a little more than 400 in height. From the comparative lowness of the sur ing district, and from its extraordinary configuratio a conspicuous object for many miles around. The mo consists of jagged pinnacles and spires rising abrupt the base of the ma , which is cloven with many clef abounds with teep precipices. It is the *Mons Se* the Romans, the *Monte Serrado* of the Spaniards, thus named either in allusion to it jagged appearan the teeth of a saw, or because the eastern face is s it sawn, which occurred, say the Spanish legends, time of the crucifixion, when the rocks were rent arms of the monastery represent a mountain with resting upon it and penetrating some distance into it. Its pinnacles and pyramids and sharp angular resemble a mountain of hardened tallinic volcanic tuff occurs between Akureyri and Kalmanstunga in I The effect of Montserrat may be realized faintly if we ourselves upon the roof of Milan cathedral, and imag forest of spires magnified a thousandfold. The spire will represent San Geronimo. The result of this contour in the case of Montserrat is to make it one most picturesque places in Europe. Paths wind alo faces of the precipices, ascending to bare grey su descending to sheltered valleys filled with evergree flowers. The Pyrenees are seen in one direction, the another, while the Llobregat winds at the foot mountain through the village of Moni-trol. Manre other villages are seen scattered over the plain; an covered with a warm red soil alternate with rich v Street says of Montserrat: "After much experie mountains, it strikes me more each time that I se among the very noblest of rocks."

The monastery, a great pile of buildings, stands narrow platform on the edge of a vast chasm in the face of the mountain. It owes its existence to an of the Virgin, said to have been carved by St Luk brought to Barcelona by St Peter in 30 A.D. Wh Moors invaded the province in 717, the image was to Montserrat and hidden in a cave. In 880 Gon bishop of Vich, was attracted to the cave by sweet and smells, and there found the image, which he dete to take to Manresa. But at a certain spot on the mo the image refused to proceed further; there it was quently deposited, and a chapel was erected to con A stone cross near the walls of the monastery still the spot where the image refused to move. Ron chapel a nunnery was built, and in 976 this was c

nverted into a Benedictine monastery. Philip II. he present church. In 1835 the monastery was sed and despoiled of the vast treasures which had lated during the Middle Ages. But the buildings lowed to remain, as well as a few of the fathers to nge of the Virgin's shrine. At present they number hundred years ago there were 76 monks, 28 lay- , 25 singing boys, together with surgeon, physician, vants. The possessions then consisted of numerous , besides great quantities of plate and jewels, includ- ilver lamps.

a Señora de Montserrat, Patrona de Cataluña, is one of the lebrated images in Spain, and her church is visited annually than 80,000 pilgrims. It is a small carved wooden image, ly handsome, but the colour of a "negro woman," and pos- agnificent robes and jewels. It has been visited by numbers igns and high ecclesiastics, and by millions of Catalonians. mber 1881 it was solemnly crowned by Leo XIII., who sent from Rome for that purpose. Quantities of *ex votos* are at the shrine: wax models of injured or diseased limbs, of ships, pictures and clothes, jewels and silver hearts, elebrity and piety of Montserrat merited, and did the of devotees. Ignatius Loyola laid his sword upon the altar gin and, placing himself under her protection, started from at to commence his new life. Many eminent Spaniards, the world, have retired to this monastery to end their days. formed solitary hermitages perched among the rocks. Of ese were fifteen, seven of which once formed a *via sacra* t the summit of San Geronimo. They were destroyed by the but the ruins of some of them still remain. From all the magnificent, one is indeed placed on the edges of pre almost macabre isolation. There are also caves in the mount ne of which were formerly occupied by monks. The most st of these are the cave of the Virgin, in which the *Santa* remained hidden until found by Condemit, and the cave Juan Garin, a notorious sinner, who ended his days in the of a voluntary penance at Montserrat. At Collbato on the st side of the mountain, near the base, there are also some ious caves.

NTUCLA, JEAN ETIENNE (1725–1799), a learned athematician, was the son of a merchant, and was born s in 1725. He attended the college of the Jesuits native city, and was early distinguished for his us memory and his aptitude for mathematics. At of sixteen he removed to Toulouse to prosecute the f law, and after taking the usual degrees he re- to Paris. There his conversational powers, his solid tion, and his acquirements as a linguist soon intro im to the notice of the learned. In the society of lert and Lalande his taste for mathematical studies firmed and stimulated. After publishing two anony- treatises on the *Quadrature of the Circle* and on the *tion of the Cube*, he gave to the world in 1758 the t of his great work, *The History of Mathematics*, ng after this his merits were recognized by the ment, and he was promoted to several important He was appointed intendant secretary at Grenoble , secretary to the expedition for colonizing Cayenne , and "premier commis des bâtiments" and censor r mathematical books in 1765. During the next five years his time was divided between his official and the study of his favourite science. The Revolu n overthrew deprived him of his income, and left him t destitution. The offer in 1795 of a mathematical r one of the schools of Paris was declined on account nfirm health, and he was still straitened circumstances in 1798 when he published a second edition of the rt of his *History*. He also enlarged Ozanam's *matical Recreations*, afterwards published in English Hutton (4 vols., Lond., 1803). About four months his death (December 1799) a pension of 2100 francs nferred upon him. His *History of Mathematics* was ed by Lalande and published at Paris in 1799-1802 4to).

his work was the first history of mathematics worthy of the name. It is characterized alike by elegance of style and by of treatment. Montucla rarely fails in candour, and never in of sympathy; he lived at a time when it would have been able to treat mathematics "as a French science," yet he with justice be accused of Chauvinism. The study of the of mathematics has greatly revived of late years, espec Germany, and numerous monographs on special departmen appeared, in which, as was to be expected, many defects positive errors in Montucla's work have been pointed ou taken as a whole, it stands as yet unsuperseded, unrivalled to its admirable style and enduring quality, to be compar Gibbon's *Decline and Fall of the Roman Empire*.

MONZA (locally Monscia), a city of Italy in th vince of Milan, at the branching of the railway for and Como, lies on the Lambro, a tributary of t mainly on the right bank, in a healthy and att situation. Of the mediaeval fortifications little r save the Porta d'Agrate. The cathedral of St Baptist is the principal object of interest: Theode basilica was enlarged at the close of the 13th cent throwing the atrium into the main building, a present marble façade was erected about the mid the 14th by Matteo da Campione. On the lef side of the front rises an incongruous brick built 278 feet high, erected by Peregrini. Within the are the iron crown of Lombardy (removed by A in 1859, and since restored) and the relics of Theod comprising her crown, fan and comb of gold, a golden hen and seven chickens, representing Lom and her seven provinces. Next to the cathedral in importance come the church of Santa Maria in and the Broletto or old palace of the commune, styled the Arengario, the former (founded in 1357 rich Bramantesque façade, reckoned one of the best of terra-cotta work in Lombardy, and the latter is on a system of pointed arches, and has a tall square terminating in machicolations surrounding a sharp cone. San Michele was the scene of the corona Conrad III. in 1128, and San Gerardo (formerly Ambrogio) is named after the patron saint of Gerardo dei Tintori, who founded the first local hosp 1174. The royal palace of Monza (1777), with its sive gardens and park, lies not far from the town banks of the Lambro. Cotton goods and felt hats staple products of Monza industry; then dyeing, building, and a publishing trade. The population city was 15,150 in 1871, and that of the commune in from 24,661 in 1861 to 28,012 in 1881.

Local antiquarians claim for Monza (Modoecia or Modoetia) of a Roman colony, but it cannot have been a place of cons till it attracted the discerning eye of Theodoric, and, thoug a favourite residence with his immediate successors, its portant association are with Theodelinda (see vol. xiv. During the period of the republics Monza was sometim pendent, sometimes subject to Milan. The Visconti, w mately became masters of the city, built a castle in 1325 now occupied by the Palazzo Durini. In the cours history Monza has stood thirty-two sieges, and been repeated ferced, notably by the forces of Charles V. The countship 1796 was purchased in 1546 by the wealthy banker Dur remained in his family till the Revolution.

MOOLTAN. See MÚLTÁN.

MOON, THE. The subject of the moon divide into two separate branches, the one concerned with t stitution of the lunar globe, the other with its m For the first subject the reader is referred to the ASTRONOMY (vol. ii. p. 801 *sq.*); the present article fined to the second, which is commonly called the *Theory*.

The lunar theory does not yet form a well- body of reasoning and doctrine, like other bran mathematical science, but consists only of a se researches, extending through twenty centuries o and incapable of being welded into a consistent

state of things arises from the inherent difficulties complexities of the subject, and from the fact that no method or system has yet been discovered by which he difficulties can be surmounted and all the com ties disentangled. Hence each investigator, when he lesired to make any substantial advance beyond his cessors, has been obliged to take up the subject from w point of view, and to devise such method as might to him most suitable to the special object in hand. historical treatment is therefore that best adapted ve a clear idea of the results of these investigations. ancient and modern histories of the subject are quite nt, the modern epoch commencing with Newton. The epoch made by Copernicus did not extend to the case ne moon at all, because in every investigation of the n's motion, modern as well as ancient, the motion is red to the earth as a centre. Hence the heliocentric m introduced no new conception of the motion, except of taking place round a moving earth instead of round ed one. This change did not affect the consideration ne relative motion of the earth and moon, with which the lunar theory is concerned. The two stages of unar theory are therefore (1) that in which the treat was purely empirical, (2) that in which it was founded nally on the law of gravitation

is in the investigation of the moon's motion that the ls of ancient astronomy are seen to the best advan

In the hands of Hipparchus (see ASTRONOMY, vol 749) the theory was brought to a degree of precision h is really marvellous when we compare it, either other branches of physical science in that age, or the remarks and speculations of contemporary non tific writers. Whether this was wholly the work of parchus, or whether he simply perfected a system dy devised by his predecessors, it is now impossible to but, so far as certain knowledge extends, the works of predecessors did not embrace more than the deter tion of the mean motion of the moon and its node ough the general fact of a varying motion may have ascertained, the circumstances of the variation had ably never been thoroughly investigated. The dis ries of Hipparchus were:

The Eccentricity of the Moon's Orbit. He found that moon moved most rapidly near a certain point of its , and most slowly near the opposite point. The law his motion was such that the phenomena could be re nted by supposing the motion to be actually circular niform, the apparent variations being explained by the thesis that the earth was not situated in the centre of rbit, but was displaced by an amount about equal to one tieth of the radius of the orbit. Then, by a well-known f kinematics, the angular motion round the earth would ost rapid at the point nearest the earth—that is, at *ee*—and slowest at the point most distant from the —that is, at *apogee*. Thus the apogee and perigee ne two definite points of the orbit, indicated by the tions in the angular motion of the moon.

The Motion of the Perigee and Apogee. As already ed, the perigee and apogee are at the ends of that eter of the orbit which passes through the eccentricity ted earth, or, in other words, they are on that line h passes through the centre of the earth and the centre o orbit. This line was called the *line of apsides*. On paring observations made at different times, it was d that the line of apsides was not fixed, but made a plete revolution in the heavens, in the order of the of the zodiac, in about nine years.

The Numerical Determination of the Elements of the n's Motion. In order that the two capital discoveries mentioned should have the highest scientific value it was essential that the numerical values of the el involved in these complicated motions should be fix precision. This Hipparchus was enabled to do b eclipses. Each eclipse gave a moment at which the tude of the moon was 180° different from that of t and the latter admitted of ready calculation. As the mean motion of the moon to be known and the to be fixed, three eclipses observed in different pa the orbit would give as many true longitudes moon, which longitudes could be employed to det three unknown quantities the mean longitude at epoch, the eccentricity, and the position of the By taking three eclipses separated at short interval the mean motion and the motion of the perigee wo known beforehand, from other data, with sufficient a to reduce all the observations to the same epoch, an to leave only the three elements already mention known. In the hands of a modern calculator the p would be a very simple one, requiring little more th solution of a system of three equations with as ma known quantities. But without algebra the solutio long and troublesome, and not entirely satisfactory it was probably correct within the necessary limit errors of the observation. The same three elements again determined from a second triplet of eclipses remote an epoch as possible, the difference in the l of the perigee at the two epochs gave the annual of that element, and the difference of mean longitud the mean motion. Such was the method of deter the elements of the moon's motion down to th Copernicus.

The determination of the eccentricity from [illegible] described, led to an important error in the resulting valu eccentricity, owing to the effect of the neglected eve to know from our modern theory that the two principal in the [illegible] true [illegible]

[illegible] centre)

where q [illegible] and D [illegible] moon from the [illegible] D 180 very nearly, and $2D$ 3 [illegible] 1 27 more, and so is the same [illegible] centre, and is confounded with [illegible] The value of the [illegible] of centre derived from eclipses is the [illegible] 29 1 2, 5 0. Therefore the eccentricity found by Hipparchus and Ptole only 5, and was more than a degree [illegible] than the true valu

The next important step in advance was the di of the "evection," which is described by Ptolem ASTRONOMY, vol. iii. p. 760) as if made by himse view of the bad habit which Ptolemy had of mak own observations [illegible] previous [illegible] arrived at were sometimes in error, we must view such a di by him as quite exceptional, and as best explainable large magnitude of the outstanding error. Altho just shown, the erroneous eccentricity found by Hipp would always represent eclipses, so that the erro never be detected by eclipses, the error was entirely d when the moon was in quadrature. Comparing equations already written with that found by Hipp we see that the latter required the correction

$$\begin{aligned} &[\text{illegible}]\ \sin q \cos(2D - g), \\ &[\text{illegible}]\ \cos 2D \sin q + \sin 2D \cos q. \end{aligned}$$

At quadrature we have D 90, $2D$ 180°, and $\cos 2D$ 1 and $\sin 2D$ 0. The omitted inequ at these points of the orbit have therefore the 2·51 $\sin q$, a quantity so large that it could not ha detected by careful observations with the instrumen an inequality as this, superposed upon the eccentric of the moon, was very troublesome to a trigonometr no way of representing the celestial motions exc geometrical construction. The construction propo Ptolemy was so different from those employed

s of the planets, and with that so intricate, that little attaches to it

student of Arabian science may find much to interest the astronomical speculations of the Arabs, but this do not seem to have furnished anything in the way ective theory. In the fourth book of *De Revolu-*, where we find the lunar theory of Copernicus, no later than Ptolemy is referred to. Moreover, as intimated, the work of Copernicus in this particu ction forms little more than an episode in the his the subject. The working hypothesis of the great of modern astronomy was borrowed from the , and was that the celestial motions were all either or compounded of circular motions. The hypo f equal circular motions, though accepted by Ptolemy e, was so strained by him in its applications that s left of it in the *Almagest* (the Arabic translation *gnitudes*). But, by taking the privilege of compound ular motions indefinitely—in other words, of adding cycle to another—Copernicus was enabled to repre e planetary and lunar inequalities on a uniform though his heavens were perhaps worse "scribbled an those of Ptolemy. To one epicycle representing ation of the centre he added another for the evection. e represented the latitude of the moon both at nes and oppositions. But the third inequality, ion," which attains its maxima at the octants and at all four quarters, was unknown to him. To Brahe is commonly and justly ascribed the discovery variation. Joseph Bertrand of Paris has indeed the discovery for Abu l'Wefa, an Arabian astro and has made it appear probable that Abu l'Wefa detected in quadrature the moon's motion which we now to have been the variation. But he has not on the part of the Arabian, any such exact de n of the phenomena as is necessary to make clear n to the discovery. Ast and Tycho, although overed the fact, he could add nothing in the way of ive theory. To the double epicycle of Copernicus obliged to add a motion of the centre of the whole orbit round a circle whose circumference passed the centre of the earth, two revolutions round being made in each lunation. Kepler, by intro a moving ellipse having the earth at its focus, was to make a nearer approach to the truth than any predecessors. But the geometrical hypothesis by e represented the inequalities due to the action of sun no greater epoch in the progress of science the geometrical constructions of his predecessors y therefore dispose of the ancient history of the eory by saying that the only real progress from ha to Newton consisted in the more exact deter n of the mean motions of the moon, its perigee line of nodes, and in the discovery of three new ities, the representation of which required geometri tions of increasing complexity with every step. modern lunar theory commenced with Newton, and s in determining the motion of the moon deductively e theory of gravitation. But the great founder of mechanics did not employ the method best adapted to the desired result, and hence his efforts to con a lunar theory are of more interest as illustrations wonderful power and correctness in mathematical ng than as germs of new methods of research. He ed perfectly in explaining the elliptic motion of two ly attracting bodies round their common centre of by geometrical constructions. But when the prob

(full title, *De Revolutionibus Orbium Cœlestium Libri VI.* lio, Norenberg, 1543)

lem was one of determining the variations from the e motion which would be produced by a third body constructions could lead only to approximate results. path to modern methods was opened up by the Conti mathematicians, whose great work consisted in red the problem to one of pure algebra. The chasm be the laws of motion laid down by Newton and a pr of algebra seems so difficult to bridge over that it is while to show in what the real spirit of the modern m consists. We call to mind the statement of Newton' two laws of motion: that a body uninfluenced by any moves in a straight line and with uniform velocity for and that the change of motion is proportional to the impressed upon the body and in the direction of force. These two laws admit of being expressed in braic language thus. Let us put m the mass of a ma point; x its distance from any fixed plane whatev the time; X the sum of the components of all the acting upon the point in the direction perpendicular fixed plane, it being supposed that each force is re into three mutually perpendicular components, one of is perpendicular to the fixed plane, then the differ equation

$$m\frac{d^2x}{dt^2} = X$$

expresses Newton's first two laws of motion with a pleteness and precision which is entirely wanting statements in ordinary language. The latter can thing more than lame attempts to express the equat language which may be understood by the non-m matical reader, but which bear the same relation algebraic equation that a statement of the operati the Bank of England in the symbolic language of a of savages would bear to the bank statement in po shillings, and pence. By taking two other planes, p dicular to each other and to the first plane, we have equations like the one last written. The law of gravi and Newton's third law of motion enable us to sub for X and the other forces the masses and coordina the various attracting bodies. Thus the data of the pr are expressed by a triplet of three equations for each a ing body. The integration of these equations is a prob pure algebra, which, when solved, leads to expressions give the position of each body in terms of the time, which is wanted. The special form which it is nec to give the equations has not been radically changed the century and a half since this method of researc opened out. The end aimed at is the algebraic expr of all the quantities involved in the form of an i series of terms, each consisting of a constant coef multiplied by the sine or cosine of an angle incr uniformly with the time. It is indeed a remarkabl that, notwithstanding the great advances which m mathematics has made in the discovery of functions general than the old-fashioned sines and cosines e mentary trigonometry, especially of elliptic function the form of development adopted by the mathematici the last century has remained without essential chan

It will be instructive to notice the general and simple p of the trigonometric functions to which is due their great ance in the problems of celestial mechanics. It may be ex thus: *If we have any number of quantities, each of which pressed in the form of a trigonometric series in which the increase uniformly with the time, then all the powers and p of these quantities, and all their differentials and integra respect to the time, may be expressed in series of the same form* theorem needs only an illustration by an example. Let ou tities be X and Y, and let us suppose them expressed in the

$$X = a\cos A + b\cos B + c\cos C +, \text{ \&c.}$$
$$Y = a'\sin A' + b'\sin B' + c'\sin C' +, \text{ \&c.},$$

in which we may suppose that the quantities $a, b, c,$ &c., c towards zero. In forming their product, the first term

$A \sin A'$. But we have $\cos A \sin A' = \frac{1}{2}\sin(A'+A) - \frac{1}{2}\sin(A'-A)$. Hence the product XY will be of the form

$\frac{1}{2}aa'\sin(A'+A) + \frac{1}{2}aa'\sin(A'-A) + \frac{1}{2}ab'\sin(A'+B') + \&c.$,

is another type of the same general form. Moreover, if those the angles A, B, &c., to increase uniformly with the that is, to admit of expression in the form

$$A = \alpha + ml, \quad A' = \alpha' + m'l, \ \&c.$$

have, by integrating,

$$\int XY\,dt = -\frac{aa'}{m+m'}\cos(A'+A) - \&c.,$$

again, is a trigonometric series of the same general form, admits of being manipulated at pleasure in the same way original expressions A and B. The property does not to the elliptic functions, and in consequence, notwithstanding the great length of the trigonometric series, no attempt sum them has been successful.

efforts to express the moon's motion by integrating ferential equations of the dynamical theory may be d into three classes. (1) Laplace and his immediate ors found the problem so complex that they ought to olify it by reversing its form, instead of trying from ming to express the moon's coordinates in terms of ne, they effected the integration by expressing the terms of the moon's true longitude. Then, by a l of the series, the longitude was expressed in terms time. Although it would be hazardous to say that ethod is unworthy of further consideration, we must that its essential inelegance is such a temporary fact study, and that it holds out no promise of development. (2) By the second general method on's coordinates are obtained in terms of the time direct integration of the differential equations of , retaining the algebraic symbols which express the of the various elements. Most of the elements are numerical fractions: e, the eccentricity of the moon about 0·055; e', the eccentricity of the earth's orbit, 0·017; γ, the sine of half the inclination of the moon's about 0·046; m, the ratio of the mean motion of oon and earth, about 0·075; and the expressions for gitude, latitude, and parallax appear as an infinite nometric series, in which the coefficients of the sines ines are themselves infinite series proceeding according the powers of the above small numbers. This was applied with success by Poetcoulant and Sir W. Lubbock, and afterwards by Delaunay. It be remarked that the solution by the first method s in the same form as by this one after the true de is expressed in terms of the mean longitude. the method just mentioned the series converge so and the final expressions for the moon's longitude long and complicated that the series has never been far enough to insure the accuracy of all the terms, especially the case with the development in powers he convergence of which has often been questioned when numerical precision alone is aimed at, it has found best to avoid this difficulty by using the cal values of the elements instead of their algebraic s. This method has the advantage of leading to re rapid and certain determination of the numerical of the several coefficients of sines and cosines. It disadvantage of giving the solution of the problem or a particular case, and of being inapplicable to hes in which the general equations of dynamics have plied. It has been employed by Damoiseau, Hansen, ry.

methods of the second general class are those most of study. And among these we must assign the nk to the method of Delaunay, developed in his *du Mouvement de la Lune*, because it contains a which may yet develop into the great desideratum of al method in celestial mechanics. To explain it, st call to mind the general method of "variation of elements," due to Lagrange. This method is applic cases in which a problem of dynamics can be com solved when any small forces which come into p left out, but which does not admit of direct solutio these forces are included. Omitting the small commonly called "disturbing forces," let us supp problem of the motion of a body under the influenc "principal forces" completely solved. This wil that we have found algebraic expressions for the nates which determine the position of the body i of the time, and (in the case of a material point) constant quantities, to which we may assign va pleasure. Then Lagrange showed how, by sup these constant quantities to become variable, th expressions could be used for the case in which th of the disturbing forces was included. In other wo effect of the disturbing forces could be determi assume them to change the constants of the first a mate solution into very slowly varying elements.

In the researches on the lunar theory before De the principal force was taken to be the attraction of th upon the moon, and the disturbing force was that the sun's attraction. When the action of the ear was included the moon would move in an ellipse, in ance with Kepler's law. The effect of the sun could be allowed for by supposing this ellipse to b able and variable. But when it was required to the variation the problem became excessively comp owing to the great number of terms required to the sun's disturbing force. Now instead of pass the elliptic to the disturbed motion by one single step, Delaunay effected the passage by a great num easy steps. Out of several hundred periodic ter sum of which expressed the disturbing force of th he first took one only, and determined the variat the Keplerian ellipse on the supposition that thi was the only one. In the orbit so the variable el of the ellipse would be expressed in terms of six ne stants. He then showed how these new constant be taken as variable instead of the elements of the ellipse. Taking a second term of the disturbing fo expressed the new constants in terms of a third set tant, and so repeated the process until all the te the disturbing force were disposed of.

Among applications of the third or numerical m the most successful yet considered is that of H His first work appeared in 1857 under the title *Mond-Tafeln, oder Tafeln des Mondes* and contained an exposition of his processes and p methods of computation. During the twenty years he devoted a large part of his energies to the m computation of the lunar inequalities, the determ of the elements of motion, and the preparation tables for computing the moon's position. In the branch of the work he received material and fr British Government which published his tables, c completion in 1872. The computations of Hans published one seven years later by the Saxon Society of Sciences.

It is interesting to compare the results of Hans Delaunay that there are some outstanding discrep which, though too small to be of great practical impo are of sufficient magnitude to demand the atten those interested in the mathematical theory of the It is therefore desirable that the numerical ineq should be again determined by another entirely different This is the object of Sir G. B. Airy's *Numerical Theory*, which is not yet completely published, sufficiently far advanced to give hopes of an early tion. The essence of Sir George's method con

with a provisional approximate solution (that of
ay be ing accepted for the purpose), and substituting
ec tions for the moon's coordinates in the fundi-
differential equations of the moon's motion a dis-
by the sun. If the theory were perfect, the two
each equation would come out equal. As they
ome out exactly equal, Sir George put the problem
hem. What corrections must be applied to the
ons for the coordinates that the two sides may be
qual? He then shows how these corrections may
d by solving a system of equations.

ve al methods which we have described have for their
the determination of the motion of the moon
under the influence of the combined attraction
f sun. In other words, the question is that of
dated "problem of three bodies" in the special
the bodies, the sun has a much greater mass than
of the moon, and at a much greater distance from them than
from each other. All methods lead to a solution of the
eral t a which we shall now describe. Let us put m for the
mass of the moon, m' of the sun, n for the moon's mean
angular velocity, n' for the sun's mean angular velocity
from the earth, a for the moon's mean distance from the earth,
a' for the sun's mean distance from the earth, e for the
eccentricity of the moon's orbit, e' for the eccentricity of the
earth's orbit, γ for the inclination of the moon's orbit to the
ecliptic. When no account is taken of the
the moon moves round the earth in an ellipse, and
in such a manner that the radius vector drawn from the earth
describes areas proportional to the times. In order
the moon's motion from this simple elliptic motion, we must
the moon's position in its orbit at any time, and the
whose nodes and perigee are at rest. All the other ele
of the orbit, viz. its eccentricity, and
duly constant, because the
other disturbing forces

most difficult and intricate of celestial mechanics, and no satisfactory general method of attacking it has yet been found. The causes of difficulty are two in number. First, the disturbing force of the planets is modified by that of the sun in such a way that the ordinary equations of disturbed elliptic motion are no longer rigorous, and hence new and more complicated ones must be constructed. And, secondly, the combination of the four bodies, earth, sun and planet lead to terms of a nature such that it has hardly been found possible to calculate them. The question has, indeed, been raised whether the rotation of the moon on its axis, and hence the unit of time, may not be subject to small irregular changes of a nature to produce apparent cosmical changes in the motion of the moon. But it has recently been found, from a discussion of the observations of Mercury in 1677, that, although such inequalities may exist, they cannot be of a magnitude necessary to account for the observed [illegible] period in the moon's motion.

The following is a summary of the present state of the lunar theory. (1) The inequalities or corrections due to the direct action on the moon may be regarded as quite satisfactory, at least when Hansen's method has been followed. (2) The secular variations by the same method. (3) The analytical theory need not be considered by finding some remedy for the slow convergence of the series by which it is expressed, but a numerical treatment may be found more satisfactory. (4) The perturbations of the planets on the moon, which method is [illegible] to be tried. With these the theory [illegible] to.

MOORCROFT, William (c. 1770–1825), traveller in Asia, was born in Lancashire about 1770. He was educated as a surgeon in Liverpool, but on completing his studies he resolved to devote himself to veterinary surgery. After studying the subject in France, he began it practice in London. In 1795 he published a pamphlet of directions for the medical treatment of horses, with special reference to glanders, and in 1800 a *Cursory Account on the Methods of Curing Horses*. Having been offered by the East India Company the inspectorship of their Bengal stud, Moorcroft left England for India in 1808. Under his care the stud was greatly improved; in order to perfect the breed, he resolved to undertake a journey into Central Asia to obtain a stock of Turkoman horses. In company with Captain William Gray, and encumbered with a stock of merchandise for the purpose of establishing trade relations between India and Central Asia, Moorcroft left Josmath, well within the Himalayas, on 26th May 1812. Proceeding along the valley of the Dauli, they reached the summit of the frontier pass of Niti on 1st July. Descending by the towns of Dabalí and Shortope, Moorcroft struck the main upper branch of the Sutlej near its source, and on 5th August arrived at the sacred lake of Manasarowara. Returning by Bhutan, he was detained some time by the Gurkhas, and reached Almorah in November. This journey only served to whet Moorcroft's appetite for more extensive travel, for which he prepared the way by sending out a young Hindustani, who succeeded in making very extensive explorations. In company with this young man and George Trebeck, Moorcroft set out on his second journey in October 1819. His enterprise was looked upon rather coldly by the directors, who merely allowed him his pay for a time, all the expenses being borne by Moorcroft himself. By way of Almorah and Ladakh, Lahore was reached on 6th May 1820. On 14th August the source of the Byash (Hyphasis) was discovered, and subsequently that of the Chenab. Leh, the capital of Ladak, was reached on 24th September, and here several months were spent in exploring the surrounding country. A commercial treaty was concluded with the Governor of Ladák, by which the whole of Central Asia was virtually opened to British trade. Kashmir was reached on 3rd November 1822, and by the Pir Panjal mountains to Rajáwárí on 4th June 1824, Cabul on 20th June, and by Khulm, Kunduz, and Balkh Moorcroft arrived at Bokhara on 27th February 1825. Everywhere he bought horses for the company, and endeavoured to establish friendly relations. At Andkho in Cabul Moorcroft was attacked with fever, of which he died on 27th August 1825, Trebeck surviving him only a few days. It was not till several years afterwards that his papers were obtained by the Royal Asiatic Society, and published under the editorship of Horace Hayman Wilson in 1841 under the title of *Travels in the Himalayan Provinces of Hindustan and the Punjab; in Ladakh and Kashmir, in Peshawar, Kabul Kunduz, and Bokhara, from 1819 to 1825*. Though published after the traveller's death, the narrative was a valuable contribution to a knowledge of Central Asia, and remains a classic. Its value as *Asiatic Researches* has been fully recognised by Moorcroft of his last journey in the *Transactions of the Royal Asiatic Society*, vol. i., a paper on the Punjab sheep.

MOORE, Edward (1712?–1757), miscellaneous poet, dramatist and fable-writer, was the son of a chandler and tea-dealer of Aberdeen, where he was born in 1712. He was the author of the thrilling domestic tragedy of *The Gamester*, originally produced in 1753 with Garrick in the leading character, and still in the repertory of acting plays.

Despite the strong [illegible] on contemporary [illegible] from stage or pulpit. The literary merit of the play is great, but it is powerfully constructed and full of impressive incident, and the career of Beverley the gambler is modelled on Fielding's Captain Booth and affords great scope for the actor. Moore also wrote two comedies. *The Foundling* (1748), which he produced clever imitations of Gay and Gray's Ballad Opera, with the assistance of Lyttelton, Chesterfield, and Walpole conducted *The World* (1753–56), a periodical during the decade of the revival of periodical essay writing. *The World* followed Johnson's *Rambler* and was followed by *The Connoisseur*, which had a rival *The Idler* and *The Connoisseur* [illegible] died at London on 1st March 1757.

MOORE, Sir John (1761–1809), born at Stirling in 1761, was one of the most prominent writers of novels and romances in the latter part of the 18th century. His novel *Zeluco*, published in 1789, produced a powerful impression at the time, and might even through the poetry of Byron, have an abiding influence on literature. The novel would nowadays be called a psychological novel. It is a study of the motives of a moral monstrosity, the selfishness and unprincipled profligate. It is full of incident, and is never pronounced into tedious reflection, but allowed to intercept the progress of the story, which [illegible] main plot is connected with many interesting episodes. The character took a great hold of Byron's imagination, and probably influenced the latter in some of its many aspects as well as his poetry. It is not too much to say that the common opinion that Byron intended *Childe Harold* to be [illegible] cannot be cleared of its large element of falsehood without a study of Moore's *Zeluco*. Moore seems to have intended the Childe to be a poetical Zeluco, and the most striking features of the portrait were undoubtedly taken from that character. At the same time it is obvious to everybody acquainted with Moore and Byron that the moody and impressive [illegible] of the character of Zeluco, fascinated him. He felt himself to be a Zeluco, although he was at [illegible] very different man. Moore's other work [illegible] marked individuality, but his sketches of society as he saw it in France, Germany, Switzerland, Italy, and Holland furnish valuable materials for the social history of his countrymen Burnett and Boswell. He was a shrewd, penetrating, and in the main unprejudiced observer, with something of a natural historian's interest in the [illegible] species, and he had exceptional opportunities of obser-

as a doctor by profession, and the son of a Stirling clergyman. After taking his medical degree at ow, he served with the army in Flanders, then was ed to the household of the English ambassador at . Here practised for five years in Glasgow, next led on the Continent for five years with a young ere, called for some years as a physician in Lon e accompanied Lord Lauderdale to Paris in 179? and d some of the principal scenes of the Revolution. e of them came under his observation, while his pro pre served him in an unusual degree from flippant His work attest great shrewdness and sagacity of ent, and how no small skill in literary presentation. ed at London in 1802

OORE, Sir John (1761-1809), the only English al who has gained lasting fame by the conduct of a t, was the son of Dr Moore (the subject of the pre notice), and was born at Glasgow on 13th November It was by appointment a tutor to the young duke amilton which procured for John Moore educational tages by which he profited so much as to be called r life the most cultivated officer in the army. It hen the fashion for young noblemen to travel from to court, and Moore accompanied his pupil and the to all the chief capitals in Europe, until he was ly ordered in 1777 to join the 51st regiment, in he had been appointed an ensign. He learned his t Minorca, and in 1779 was appointed lieutenant and ter in a new regiment recently raised by the duke n Gordon, with which he served in America till the pe of 1783. In 1784 Moore, though but twenty-three year was returned to the duke of Hamilton's member Parliament for the united borough of Selkirk, Peebles, Lanarkshire. In parliament he does not seem to have d his mouth, though he always voted with the Govern t but he made many influential friends, notably the duke k and Pitt. In 1786 he was promoted to a majority 51st regiment, and in 1787 he became lieutenant Ireland to expend his time in performing. He soon got gnment to his order, and in 1792 sailed with it to Gibraltar. He was too late to assist at Toulon, engaged thence in the operations in Corsica, and ably distinguished himself at the taking of Calvi the expulsion of the French. Moore became very in with Paoli and many of the leading Corsican patriots, rimacy was so obnoxious to Sir Gilbert Elliot, the y, that Moore was ordered to leave the island in forty hours. Sir Gilbert's hasty conduct by no means met approval in London, and Moore was gazetted both a ner'al, and ordered to proceed with his brigade to t Toulon. In April 1796 he reached Barbadoes, ere became the right hand of Sir Ralph Aber the commander-in-chief. The first enterprise was quest of the island of St Lucia, which was com ished by an agent of Victor Hugues with a force of Caribs, negroes, and Frenchmen. The key e was carried, and about impregnable height the Morne Fortune, which was at last stormed, though ere it fell, by the valour of brigadier-generals Moore ope, who was to be commended on not yet more memor held. After the success, Sir Ralph left the island, ppointed Moore governor and commander-in-chief fficult post he found his government, owing to the of Caribs and negroes in the woods; but just as on the point of triumphing he fell ill of yellow fever, s ordered home. In 1798 he was well and again to be on active service, and he accompanied his friend ombe over to Ireland, where he received the com of the Bandon district. In the Irish rebellion of he distinguished himself by his activity in saving Wexford from destruction after the battle of Vinegar H His services were in universal request, and Abercrom insisted upon his serving with him in the expedition to Holder in 1799, where he did creditably all that was cred ably done in that ill-managed expedition. On his ret from Holland he was made colonel of the 52d regime and in 1800 accompanied Abercromby to the Mediterran as major-general.

Throughout the Egyptian expedition he commanded reserve, and especially distinguished himself at the bat of Alexandria, when he was wounded in three places, a behaved with such distinction that he was recognized u verally as the greatest English general, now that Ab cromby was gone. The short interval of the peace Amiens did not injure Moore's prospects, and in 1803 was appointed commandant of the camp at Shorncli Here he proved his greatness as an organizer, for it at this time that he organized those light regiments wh were to form the reserve in his own campaign and light division in the Peninsular War. While at Shornel he renewed his intimacy with Pitt, who was then resid at Walmer Castle and who on his return to office ma Moore a knight of the Bath, and consulted him on ev military project. Fox, when he succeeded to office, show the same appreciation of Moore, and in May 1806 appoin him second-in-command to his brother, General Fox, w was ordered with a strong force to Sicily to supersede John Stuart. Moore won but little credit at this time, there was none to gain, but employed his time, accord to Napier, in falling in love with Miss Fox, to whe however, he never proposed, because to be accepted for position and not for himself. In 1807 he was able to esc from the intrigues of the Sicilian court, and was orde to Portugal, which he reached too late to make any defe of Lisbon, already in the possession of the French. then went home, and had four months' rest, the last ever had. In May 1808 he was ordered with a force 13,000 men to Sweden to assist the king against the un forces of France and Russia. The mad conduct of Swedish king, however, who even went so far as to deel Sir John Moore under arrest when he refused to acquie in his plans, ruined any chance of successful co-operati and the French general made his escape and returned England. He was at once ordered to proceed with division to Portugal, where Sir Arthur Wellesley h already landed, but the appointment of Dalrymple a Burrard to the chief command was even more of a slig on Moore as a general of European experience than Wellesley, whose laurels had hitherto been won in Ind He regarded himself as personally insulted by the ministe and especially by Lord Castlereagh, but deemed it his du to go where he was ordered. He met his reward; for wh after the excitement caused by the Convention of Cint Dalrymple and Burrard went home, he was left in co mand of the largest English army since the commencem of the war. Wellesley had appreciated him, and in interesting letter (published in the *Wellington Despatch* had expressed his desire to use his own great politi influence to reconcile him to the ministers and the minist to him.

Now began the glorious three months on which Moor reputation as a soldier and a statesman must rest. T Spaniards, flushed with their former success at Bayl recalled Napoleon, who had in person crossed the Pyrene as another Dupont, and loudly summoned Moore to a sh in their coming victories. Moore knew better what w the value of Napoleon's genius, but he had been command to assist the Spaniards, and therefore gave the order advance. His army marched in four distinct divisio and on 13th November 1808 he concentrated at Sa

manca, where he waited to see what would happen. He heard that a subsidiary force under Sir David Baird had arrived at Coruña, and ordered it up to join him. At Salamanca he remained a whole month watching the triumphant successes of Napoleon and his lieutenants, and learning how little Spanish reports or Spanish valour were to be relied on. Though irritated by the menaces and abuse of Frere, the English minister to the junta, he waited till the 13th December, hearing duly of Spanish defeats, and then he determined to draw off upon his own small force the weight of Napoleon's power, and thus give Andalusia the winter in which to organize an army and prepare for another Bayler. With this intention he advanced through Toro and Mayorga, where Baird joined him, to Sahagun. He judged rightly that Napoleon would never advance into Andalusia and leave the English behind him, but that he would turn all his power against them. Having once drawn Napoleon's attention to himself, he began his famous retreat and fell back quickly, fighting every day and resolutely with success. He now could test the military spirit he had tried to form at Shorncliffe, for the reserve under Sir Edward Paget consisted entirely of his own light regiments. To detail each step of the retreat and every skirmish would be but to rewrite Napier; suffice it to say that, with great loss of life and material, Moore reached Coruña on 12th January 1809. But the fleet to take the army home was not there, and the English would have to fight Soult, whose army was even more weakened and demoralized than Moore's, before they could embark. It was on 16th January that Moore fought his last battle; he fell early in the day, and knew at once that his wound was mortal. His last hours were cheered with the knowledge of victory, but were spent in recommending his old friends, such as Graham and Colborne, to the notice of the Government. Sir H. Harding's description of the scene is in its way inimitable, and in it must be studied how a modern Bayard should die in battle, every thought being for others, none for himself.

It may be possible in the face of his heroic death to exaggerate Moore's actual military services, but his influence on the British army cannot be overrated. The true military spirit of discipline and of valour, both in officers and men, had become nearly extinct during the American war. Abercrombie, who looked back to the traditions of Minden, was the first to attempt to revive it, and his work was carried on by Moore. The formation of the light regiments at Shorncliffe was [illegible] new French tactics, and it was left to Wellington to show the success of the experiment. Moore's powers as a statesman are shown in his despatches written at Salamanca, and he had the truest gift of a great man, that of judging men. It may be noticed that, while Wellington perpetually grumbled at the bad qualities of his officers and formed no school, Moore's name is associated with the career of all who made their mark. Among generals, Hope, Graham, Sir F. Paget, Hill, and Craufurd, all felt and submitted to his ascendency, and of younger officers it was ever the proud boast of the Napiers, Colborne, the Beckwiths, and Barnard that they were the pupils of Moore, not of Wellington. Nay more, he inspired an historian. The description of Moore's retreat in Napier is perhaps the finest piece of military history in the English language, not only because the author was present, but because his heart was with the leader of that retreat, and, if Napier felt towards Wellington as the soldiers of the fourth legion felt towards Cæsar, he felt towards Moore the personal love and devotion of a cavalier towards Montrose.

The great authority for Moore's life is the *[illegible]* by his brother, J. C. Moore (1873); see also *Narrative of the operations of Sir John Moore in Spain*, by his brother, J. C. Moore (1809, with plans 1809), Napier's *Peninsular War*, Bk. iv., and his *Life of Sir Charles Napier*. For various references to Moore's retreat, see Charmilly, *Narrative* (1810), and Sir Lewis Tonyn, *Life of the Rt. Hon. J. H. Frere* (published anonymously by his widow). Consult also Wilson, *Campaign in Egypt*, for Moore's services there, and the *Life of Gilbert Elliot, First Lord Minto*, for the squabble in [illegible] (H. M. S.)

MOORE, THOMAS (1779–1852), born at Dublin on 28th May 1779, fairly shares with Lord Byron the honour of being the most popular poet of his generation. Whatever may be thought now of the intrinsic qualities of his verse, this much cannot be denied. The most trustworthy of all measures of popularity is the price put upon a writer's work in the publishing market, and when Moore's friend in negotiating the sale of the unwritten *Lalla* claimed for the poet the highest price that had up time been paid for a poem the publisher at once a Moore was then in the heyday of his reputation, but years later publishers were still willing to risk the sands on his promise to produce. Much of Moore's was due to his personal charm. Thus at least ga the start on his road to popularity. There is not extraordinary incident in the history of our literatu the *in tantamount* sense with which the son of a Dublin grocer just out of his teens, on his first London, captivated the fashionable world and est himself in the course of a few months a coveted favourite. The youth once called at St George Channel to keep terms at the Middle Temple, carrying with [illegible] manuscript of *Odes and Epistles*, which he w published by subscription in a very short time crucified but the fashionable world, among [illegible] had also secured the personal patronage of the prince o to dedicate the work to him. The money proved [illegible] collected and the dedicatory verse would not also enabled the poet to visit his native [illegible] Moore [illegible] were of the most fortunate kind. He charmed all w met, and [illegible] he was not a precocious, with nothing more than such bright sayings own age. The prince and not the boy, was [illegible] mind, but he came nearer than anybody else in time to be hoped Percy Bysshe Shelley [illegible] To find a parallel to him we must look back to the pal of Provençal song, *[illegible]* and *jong* Arnaud Daniel and Bertran, whose varied po entertainment made them welcome guests wherev went. It was not merely the fashionable world young adventurer captivated. The landlady of his [illegible] in London, a country woman of his own, offered to his disposal all the money of which he had the co

accentuation. It may be remarked in passing that the r
of the hostile meeting with Jeffrey is a striking evid
of the impressiveness of Moore's personality; in the co
of a few minutes' conversation he changed a bitter e
into a lifelong friend. Of all the poetical enterprises
Moore undertook, either at this period or later, none
so exactly suited to his powers as the task proposed to
by the publisher Power of supplying fit words to a colle
of Irish melodies. The first number appeared in 1807
it was so successful that for twenty-seven years afterw
a volume would be issued. It was one of Moore's most re
occupations and his steadiest source of income, Power
ing him an annuity of £500. Six numbers of Irish mel
were published before 1815; then they turned to sa
song and national airs, issuing also four more numbe
Irish melodies before 1834. Moore entered into this
with his best and most practised powers and with al
heart. From his boyhood he had been in training fo

rious Anacreontic sentiment, namby pamby when not rient; he wrote with full inspiration, unreserved sty, and thoroughly roused faculty. Divorced from the sic, many of them are insipid enough, but they were er meant to be divorced from the music; the music meant, as Coleridge felt when he heard them sung by poet himself, to twine round them and overtop them the honeysuckle. Moore accomplished this with uisite art. His most conspicuous failure may be ed to his habit of taking a humdrum point not an otional incident but some unromantic intellectual con-. Hence arose intellectual discord upon which and ifectly harmonized tunes, which even the music can dly gloss over.

The recent desertion of the Whigs must for ever cut them from all hope of office for many years to come and ore from his last hope of a more sincere, when Lord rd also was practically withdrawn from them. There was once a marked increase in his literary fertility, and he ke ground in a new field, which he cultivated with emigrate success—political squibwriting. Moore was apable of anything like rancour, but he felt the disappointment of his hopes enough to quicken his fancy and spur the edge of his wit. The prince regent he held nd and patron, who was used to have lavished all Lord ras's appointment for personal favourites, was his ss. The prince's defects and foibles, his fatness, his ge whiskers, his love for artifice and circumstance, for ared dresses and practical jokes, were ridiculed with the nte of clever hands. Moore opened fire in the *Morning ron*, and crowned his success in New Year (1813) with nn volume of "Intercepted Letters, or *The Twopenny Post* ". A very little knowledge of the groups of the time bles us to understand the delight with which Moore's ies were received in the year which witnessed the rcrcommitment of Leigh Hunt for more outspoken attacks the regent. Moore received every encouragement to k the new vein. He was at one time in receipt of egular salary from the *Times*; and his little volumes squibs published at intervals, *The Fudge Family in Paris*, 1818; *The Journal of a Member of the Parliament ately*, 1820; *Fables for the Holy Alliance*, 1823, *Odes Cash, Corn, Catholics, and other Matters*, 1828, *The lges in England*, 1835 went through many editions. prose *Memoirs of Captain Rock* (1824) may be added he list. Moore's only failure was *Tom Crib's Memorial Congress* (1819), for which he had made an elaborate ly of thieves' slang. It was of course on the side of Whigs that Moore employed his pen, and his favourite ies were the system of repression in Ireland and the abilities of the Catholics. He made rather too certain aim for his pasquinades when he spoke of "laying the on the back of the blood and the oppressor. It was exactly a lash or a scourge that he wielded. It was happy, airily malicious ridicule of personal foibles that strength lay; he pricked and teased his victims with rp and tiny arrows. But, right as his hand was, he was ly entitled to the enthusiastic gratitude of his country for his share in effecting Catholic emancipation.

The disappointment of 1812, which diverted Moore's career as a squib-writer, nerved him also to a more ained effort in serious verse than he had before attempted. *Lalla Rookh* would never have been written he author's necessities had not compelled him to work. keep himself at the oar, he contracted with the Longs to supply a metrical romance on an Eastern subject, ch should contain at least as many lines as Scott's *eby*, and for which the publishers bound themselves to three thousand guineas on delivery. The poem was published till May 1817. Moore, as was his habit, made most laborious preparation, reading himself into familiarity with Eastern scenery and manners, retired to a cottage in Derbyshire, near Lord Moira's at Donnington Park, that he might work undisturbed sate from the distractions of London society; "amid the snows of a Derbyshire winter" as he patently elaborated his voluptuous pictures of scented valleys, gorgeous gardens, tents, and and hours of ravishing beauty. The confidence publisher was fully justified. Moore's contemporaries were dazzled and enchanted with *Lalla Rookh*, indeed a wonderful *tour de force*. There was not margin or attraction in it that an ordinary Englishman under could without a load note. He lets humour work the correctness of the local colouring and the manners were circulated of Oriental natives who would not that Moore had never travelled in the East. Moore's success in realising Oriental character thoroughly, of dress and description. If the work an Irish patriot betrayed by an informer, his priestly surrounded Catholic maiden bravely, even rapturously, his Melesanna a melodramatic stage monster, they are richly covered with Oriental trappings their identity is considerably disguised. Of the tale put into the mouth of Feramorz, the "Veiled Prophet the least said is to Moore's credit. Like a carpet merchant, Moore understood the enthusiasm with which Moore's tales were received at "the best that we have had and we even become the boast of Europe with achieved the success, but neither started literature launched but the enterprise could have only extended reputation. He deliberately sacrificed the higher of poetry for accuracy of costume and effect, rhyme and rhythm, and he had his reward. Oriental in the *Lalla Rookh* publishers would hardly be popular than *Lalla Rookh*. The extent of the manufacture was known by the care with attended to successive editions, which were printed from Turk to evade a chorus of imposts which were to impede the flow of the work. Immediately on completion of *Lalla Rookh* Moore obtained his to Sloperton Cottage in Wiltshire, to be near Lansdowne and the library at Bowood, his next project being a life of Sheridan. His plans were interrupted by the emergence of the necessity of his at Bermuda, which he knew already mentioned in avoid arrest for the debt contracted at Paris. He continued till November 1818, when the affair was promised. His friends lamented that the attractive Paris occupied so much of his time; but, though he certain almost daily records of visits to operas and testify to the extent and variety of his social life, was by no means lost. He wrote steadily of quite diverse kinds, he also composed the *Epicurean* and accumulated materials for his prose of the *Epicurean* a vast amount of production considering his love and, must have habits of composition. during the stirring political and social excitement of the years, few men could in the mid-st of literature and although he has left brilliant part in conversation, we can see from a of his diary with his published writings, that his eyes open to fact and written-up which he made his own. The starting of the drawing room much bee as butterfly. On his return to England turned work steadily at his memoir of Sheridan, *Captain Rock* as a *jeu d'esprit* by the way. The S triumphantly dispatched in the autumn of 1825, next important work was the *Life of Byron*.

of this was publi hed early in 1830, and the second ly by the end of the ame year In 1831 he com memoir of Lord Edward Fitzgerald, for which he n collecting material for some time. s a misfortune for the comfort of the la t twenty Moore - life that he allowed himself to be drawn project for writing the "History of Ireland in *s Cyclopaedia*. Scott and Mackintosh dabbled companion volumes on Scotland and England with tle trouble, but Moore had neither their historical nor their despatch in writing. Laborious con n and precision are a fatal combination for who undertake a new kind of task late in life. tory sat like a nightmare on Moore for fifteen nd after all we left unfinished on the melancholy of hi power in 1845. From the time that he d himself with it Moore did very little else, beyond casional ode and song, the last flashes of hu and the *Travels of an Irish Gentleman in Search om*, although he had frequent offers of more e and, it might have been thought, more congenial Moore character had a deeper madder and than he often cut credit for, and his tenacious ce in the last task was probably due to an ible ambition to connect himself as a benefactor hi tory of his country, by opening the eyes of lish people to the mis-government of Ireland. It supplemental altogether, the lighter irony of *Captain* as much more effective than the minute carefully l details of the history. Moore last years were l by the weakness and misconduct of his sons, and untary embarrassments. An annual pension of as conferred upon him in 1835, and he had always l large sums for his work, but, while waiting for ecure which never came, he had contracted an nate habit of drawing upon his publishers in e. After the death of his last child in 1845, Moore a total wreck, but he lingered on till 26th February The diary, which he seems to have kept chiefly ught be the means of making some provision for , and which contains so many touching expressions ffection for her, was edited by Lord John Russell letters and a fragment of autobiography in 1853. he charge of vanity has often been brought against ry from the writer's undue fondness for tokens of pliments paid him by distinguished personages and e embassy. But only vanity that is annoyed by slavish sanctimoniousness. (W. M.)

OOBIIN the large or white-vented bird, often called ben and sometimes Gallinule, is most commonly in England. An earlier name was Moat hen, which propriate in the days when a moat was the ordinary of most considerable houses in the country. It is *Hiaatia chloropus* of ornithologists, and almost too own to need description. About the size of a small hen, but with the body much compressed (as is ith members of the Family *Rallidae*, to which it), its plumage above is of a deep olive brown, so to appear black at a short distance, and beneath

to be confounded with "Moor-cock" or "Moor fowl," names in general use for the Red Grouse (vol. xi. 221).

non-grey, relieved by some white stripes on the fla with the lower tail coverts of pure white, - these last b very conspicuous as the bird swims. A scarlet fron especially bright in the spring of the year, and a red ga on the tibia of the male render him very showy. The often frequenting the neighbourhood of man, the M hen seems unable to overcome the inherent stealthy ha of the *Rallidae*, and hastens to hide itself on the l alarm; but under exceptional circumstances it may induced to feed, yet always suspiciously, with tame du and poultry. It appears to take wing with difficulty, may be often caught by an active dog; but, in realit is capable of sustained flight, its longer excursions b chiefly performed by night, when the peculiar call no utterer is frequently heard as the bird, itself invisibl the darkness, passes overhead. The nest is a mass flags, reeds or other aquatic plants, often arranged much in the manner almost always near the water's edge, whe chamber can be most essentially chosen; but should a mill sluice gate, or boat house afford a favourable site, ad large will be taken of it, and not unfrequently the be of a tree at some height from the ground will furnish place for a cradle. The eggs, from seven to eleven in numb resemble those of the Coot (vol. vi. p. 511), but are sma lighter, and buffier in colour, with spots or blotche reddish brown. In winter, when the inland waters frozen, the majority of Moor hens betake themselve the tidal rivers and many must leave the country enti though a few seem always able to maintain their exist however hard be the frost. The common Moor he extensively spread throughout the Old World, being fo also at the Cape of Good Hope, in India, and in Japan. America is represented by a very closely allied form *galeata*, so called from its rather larger frontal helm, an Australia by another, *G. tenebrosa*, which generally w the white flank markings. Both closely resemble *G. c* ept in general habits, as does also the *G. pyrrhorho* Madagascar, which has the lower tail-coverts buff inste white. Celebes and Amboyna possess a smaller cog species, *G. henicleptes*, with red legs; tropical Africa the smallest of all, *G. angulata*; and some more that h been recognized as distinct are also found in other r or less isolated localities. One of the most remarkab these is the *G. nesiotis* of Tristan da Cunha," which wholly lost the power of flight concomitantly with shortening of its wings and a considerable modificatio its external apparatus, as well as a strengthening of its pe gizzle and legs.[4] A more extreme development in direction appears to be exhibited by the singular *Habro nithe* of Jilolo,[5] and to some extent by the *Pareudr rallina* of Samoa, but at present little is known of eit or other form, such as the common *Gallinula* (*Eryt phoenicura*, and *Gallinula cristata* of India, as well as South American species placed in the genus *Porphyr* there is not room to speak; but mention should be m of the remarkable Australian genus *Tribonyx*, contai three species,[6] which seem to be more terrestrial aquatic in their haunts and habits.

Allied to all these is the genus *Porphyrio*, including bird so named by classical writers, and perhaps a d other species often called Sultanas and Purple W hens, for they all have a plumage of deep blue, becoming violet, green, or black in parts, but preser the white lower tail-coverts, so generally character

group; and their beauty is enhanced by their scarlet nd legs. Two, *P. albus* of the Ethiopian Region and South-American *P. paradisea*, are of small size. Of the r species, *P. cristatus* is the "Porphyrio" of the an s, and inhabits certain localities on both sides of the terranean, while the rest are widely dispersed within ropics, and even beyond them, as in Australia and Zealand. But this last country has produced a more gerated form, *Notornis*, which has an interesting and aps unique history. First described from a total skull rof. Owen,[1] and then thought to be extinct, an example soon after taken alive," the skin of which (with that feather procured like the first by Mr Walter Mantell) be seen in the British Museum. Other bird-remains from time to time noted by Prof. Owen,[2] but it began feared that the bird had ceased to exist,[3] until a third ple was taken about the year 1879 the skin and most ne bones of which, after undergone examination in Zealand by Dr Buller and Prof. T. J. Parker,[4] found way to the museum of Dresden, where Dr A. B. Meyer vered the recent remains to not the fossil, and while keeping for the latter the name *antalli* gives the former that of *N. hochstetteri*. What s to have been a third species of *Notornis* formerly bited Lord Howe's Island, but is now extinct (see s, vol. iii. p. 732, note). Whether the genus *Aptornis*, ich Prof. Owen has described the remains from New nd, was most nearly allied to *Notornis* and *Porphyrio* ot here be decided. Prof. T. J. Parker (*loc. cit.*) con- s it a "development by degeneration of an ocydromine" (see OCYDROME). (A. N.)

ORATIN, LEANDRO FERNANDEZ DE (1760–1828), rish dramatist and poet, was the son of N. F. Moratin noned below, and was born at Madrid on 10th March . His poetical and artistic tastes were early deve l, but his father, keenly alive to the difficulties of the ry calling, caused him to be apprenticed to a jeweller. he age of eighteen Moratin surprised friends by ing the second prize of the Academy for a heroic poem e conquest of Granada, and two years afterwards he eted still more general attention by a similar suc s *Lección Poética*, a satire upon the popular poets of lay. Through Jovellanos he was now appointed secre- to Cabarrus on his special mission to France in 1787, during his stay there he diligently improved his oppor ies of becoming acquainted with the contemporary ch drama, and of cultivating the acquaintance of men tters. Of the literary friendships he then formed the important was that with Goldoni, indeed, Moratin uch more correctly styled "the Spanish Goldoni" than Spanish Molière." On his return to Spain Florida ca presented him to a sinecure benefice in the diocese Burgos; and in 1790 his first play, *El Viejo y la* (The Old Husband and the Young Wife), a highly ned but somewhat dreary verse comedy in three acts- en in 1786, but delayed by objections of the actors, was at length produced at the Teatro del Principe success was only moderate. *El Café* or *La Comedia* on the other hand, given at the same theatre two afterwards, at once became deservedly popular, and considerable influence in modifying the public taste is a short prose comedy in two acts, avowedly int to expose the follies and absurdities of the contemp dramatists of the school of Lope de Vega, and to secu commanded the support of the moderns, and it is still with pleasure for the simple ingenuity of its plot, the liveliness of its and the easy grace of its style to the student of literature it throws much useful li the contemporary state of the Spanish drama, and o reforming aims of the author and his party. In the year (1792) Floridablanca was disgraced, but M at once found another patron in Godoy, who provide with a pension and the means for foreign travel. He a rapidly passed through France into England, where he the free and somewhat incorrect translation of *A* which was printed in 1798, but which has never been formed. From England he proceeded to the Low Cou Germany, Switzerland, and Italy, and on his return Pyrenees in 1796 he received a lucrative post at the P Office. His next appearance in the dramatic field not take until 1803, when *El Barón* was first publicly exhibi its present form. It never fully weathered a determ attempt to damn it, and still keeps the stage. It followed in 1804 by *La Mojigata* ("The Female ente"), of which imperfect manuscript copies had to circulate as early as 1791. It was favourably re as on the whole it deserved to be by a public whic now at one with the author as to the canons of hig an attempt to suppress it by means of the Inquisit alleged religious grounds (*La Mojigata* being an imit a somewhat feeble one, of Molière's *Tartuffe*) was fully frustrated. Moratin's last and crowning triumph the department of original comedy was achieved in when *El Sí de las Niñas* ("The Girl's Yes") was perf night after night to crowded houses, ran through s Spanish edition in a few years, and was soon trans into several foreign languages. In 1808, on the fall o Prince of the Peace, Moratin found it necessary to Spain, but shortly afterwards he returned and con to accept the office of librarian under Joseph partook of that step, which, as the event proved, perma alienated from him the sympathies of his country compelled him to spend almost all the rest of his exile. In 1812 in *Lucas del Campo*, *Hartos*, a trans and adaptation, to the more dignified and stately S standard of Molière's *Les Précieuses*, was produc Madrid, and in 1813 *El Médico a Palos* (from *Le M Malade*) at Barcelona. From 1814 to 1828 M lived in France, principally at Paris, and devoted h to the preparation of a planned work on the history Spanish drama (*Orígenes del Teatro Español*), which tantalizingly topsheet of the period of Lope de Vega died at Paris on 21st June 1828.

[3] Thus the leg-bones and what appeared to be the sternum were bed and figured by him (*Trans.*, iv. pp. 12, 13, pl. [illegible]); the pelvis and another femur (viii. pp. 369, 375, pls. xlvi. xlvii.); the supposed sternum subsequently proved not to be that of *nus*, and Professor Owen's attention being called to the fact he ed the error (*Proc.*, 1882, p. 689) which he had previously "inclined to believe" (*Trans.*, viii. p. 120) he had made. Notwithstanding the evidence, which it must be allowed pre l some incongruities, offered by Mr Mackay (*Ibis*, 1867, p. 141, *Trans. N. Zeal. Inst.*, xiv. pp. 238-258.

me statesmen, poets, and men of letters; and
ely he became the leading spirit of the club of
men which frequented the Fonda de San Sebastian
luded Ayala, Cadahalso, Iriarte, Conti, and others.
2 he left the court, and was called to the bar; four
terwards he succeeded Ayala in the chair of poetry
Imperial College. He died on 11th May 1780.
e became at an early period of his life a convert to the
of those who, such as Montiano and others, were attempt
to the native romantic drama from the Spanish stage and
literary efforts were devoted to the cause of the atrical
In 1762 he published three small pamphlets, entitled
ro al Teatro Español. The Truth told about the Spanish
which he severely criticized the old drama generally, and
ly the still flourishing "autos sacramentales." They were
cessful that the exhibition of "autos sacramentales" was
ed by royal edict three years afterwards (June 1765). In
also published a play entitled *La Petimetra*, the Petite
s, or Female Fribble, the earliest Spanish comedy
vowedly on French model. He was preceded by Ignacio
which Lope de Vega and Calderon never were ambitious
Neither the *Pensativa*, however, nor the *Lucrecia*, an
tragedy in imitation of Seneca's manner, but with the conventional
French stage ever claimed the honour of a public repre
Two subsequent tragedies, *Hormesinda* (1770) and
el Inca (1777), were exhibited with partial success. In
1781 he published a collection of short prose essays, chiefly lyrical,
a title of *El Pensador*, and in 1782 a short didactic poem on
Obligaciones del Hombre. His *Sepelio* (a burlesque on the
ion of his ships by Cortes), *Los Nombres de Cristo*, *La Gruta*,
Salud, without success, for a prize offered by the Academy in
not published until after his death (1781). His poetry
ised by Ticknor as "the noblest poetry of Spain produced
during the 18th century," is now remembered chiefly
on account of its personal allusions. A volume of *Obras Póstumas*, with a life, was published
lona in 1821, and reprinted at London in 1826. See also
ndo de Cádiz Española, vol. ii. 1846.

MORAVIA (in German MÄHREN), a margravate and
and in the Cisleithan part of the Austrian Hungarian
lies between 15° 5′ and 18° 15′ E. long., and 48°
50′ 10″ N. lat. Its superficial extent is about
quare miles. Physically Moravia may be described
ountainous plateau, sloping from north to south, and
d on three sides by mountain ranges of considerable
ht. On the north it is separated from Austrian and
n Silesia by the Sudetes, which attain a height of
et in the Altvater or Schneeberg, and sink gradually
s the west, where the valley of the Oder forms a break
n the German mountains and the Carpathians. The
e the dividing range between Moravia and Hungary,
ho te an average height of 3000 to 4000 feet. On
t are the so-called Bohemian Moravian mountains,
g the elevated east margin of Bohemia and descend
terraces, but without clearly-defined ridges, to the
arch. Branches of these different ranges intersect
ole country, making the surface very irregular,
towards the south, where it consists of fertile and
e plains. Owing to this configuration of the soil
mate varies more than might be expected in so small
a so that, while the vine and maize are cultivated
ely on the southern plains, the weather in the
ainous districts is somewhat rigorous. The mean
temperature at Brünn is 48° Fahr. The harvest
he mountainous portion of Moravia is about five weeks later than
the south. Almost the whole of Moravia belongs
a-in of the March or Morava, from which it derives
e, and which, after traversing the entire length of
ntry in a course of 140 miles and receiving
ts tributaries (Thaya, Hanna, &c.), enters the Danube
Pressburg. The Oder rises among the mountains
north-east of Moravia, but soon turns to the north
s the country. With the exception of a stretch of
ch, none of the rivers are navigable. Moravia is
e of lakes, but contains numerous large ponds.
re also several mineral springs.

Nearly 97 per cent. of the soil of Moravia is produ
arable land occupying 53, gardens and meadows
pasturage 9, and forests 26 per cent. of the total.
one of the chief corn growing regions of the Austrian e
and also produces excellent hemp, flax, potatoes, veget
and fruit. The following table shows the amount
chief crops in 1881 :—

Wheat	154,480 qrs.	Leguminous crops	27,8
Rye	1,242,480 „	Beet (for sugar)	11,533,3
Barley	981,190 „	Flax	47,1
Oat	1,197,150 „	Hemp	6,2
Maize	48,100 „	Fruit	1,106,5
Potatoes	1,271,800 cwt.	Wine	2,869,4

Large quantities of hay and other fodder, besides
clover, teasel, madder, fennel, &c., are also raised. The
on the slopes of the Sudetes produce abundance of exc
timber. The live stock of Moravia in 1880 consis
122,858 horses, 677,807 cattle, 158,852 sheep, 20
swine, and 116,880 goats. The breed of sheep
Carpathians is of an improved quality, and the horse
in the fertile plains of the Hanna are highly este
Geese and poultry are also reared. In 1880 Moravi
tained 83,140 beehives, and the produce of wax and
may be estimated at 3500 to 4000 cwts.

The mineral wealth of Moravia, consisting chie
coal and iron, is very considerable. In 1881 the pr
included 392,625 tons of anthracite coal, 50,665 t
lignite, 5700 tons of iron ore, 1713 tons of graphit
smaller quantities of alum, potter's clay, and roofing
The mines give employment to 4500 persons, an
annual value of the raw minerals produced is
£370,000. The amount of raw and cast iron pro
by the ironworks and foundries in 1880 was 40,000
and the value about £320,000.

In point of industry Moravia belongs to the fo
provinces of the empire. The principal manufa
are woollen, cotton, linen, and cast iron goods, beet-
leather, and brandy. Its woollen cloths and flanne
manufacture of which centres in Brünn, have long
celebrated. The linen manufacture is decreasing
portance as cotton manufactures develope. The qu
of sugar made from beetroot is steadily increasin
1880 about 600,000 cwts. of sugar were produced in
seventy factories. About 10 per cent. of the total value
manufactures of Austria, representing an annual amo
£13,000,000 to £15,000,000, falls to the share of Mo
The trade of Moravia consists mainly in the excha
the various raw and manufactured materials above
tioned for colonial produce, salt, and raw manufac
material. The lack of navigable rivers or canals is
pensated by good roads and an extensive railway s
The most important commercial towns are Brünn for
factures and Olmütz for live stock.

In educational matters Moravia compares favo
with most of the Austrian states. It contains 10 gym
10 real gymnasia, 13 real schools, numerous schoo
special purposes, and nearly 2000 lower schools. T
university of Brünn is now represented by a tec
academy, and a theological seminary. Of children of s
going age 79 per cent. attend school regularly. In
about 16 per cent. of the Moravian recruits could
their names, as compared with the extremes of 8
cent. in Lower Austria and 1¼ per cent. in Dal
Fully 95 per cent. of the inhabitants are Roman Ca
under the ecclesiastical jurisdiction of the archbish
Olmütz and the bishop of Brünn, while about 2 pe
are Jews, and 3 per cent. Protestants.

Moravia sends 36 members to the Austrian reic
9 of these representing the landed proprietors, 1
towns and chambers of commerce, and 11 the peas

ial affairs are managed by the landtag, consisting Roman Catholic archbishop and bishops, 30 repres es of the landed gentry, 37 representatives of the and chambers of commerce, and 31 representatives country districts. There are six courts of justice first instance in Moravia, and one of the second e (at Brünn), whence appeal lies to the supreme at Vienna. For military and judicial purposes a is united with Austrian Silesia.

avia belongs to the group of old Slavonic states have preserved their nationality while losing their l independence. Upwards of 70 per cent. of the ants are Slavs, who are scarcely distinguishable heir Bohemian neighbours. The differences in between the two countries are very slight, and are gradually lost in a common literary language. The of Czech, however, is usually reserved for the ians, while the Slavs of Moravia and West Hungary ed Moravians and Slovaks. The Czechs have lost f their ancient tribal names, but the Moravians are vided into numerous secondary groups (Hovaks, s &c.), differing slightly in costume and dialect easants usually wear a national costume. In the f Moravia are a few thousand Croats, still preserving ners and language after three centuries' separation eir kinsmen in Croatia, and in the north-east are ns Poles. The Germans form about 26 per cent. population, and are found mostly in the towns and border districts. The Jews are the best educated inhabitants, and in a few small towns form a tal the population. Their sympathies generally lie e Germans. In 1880 the population was 2,153,107, g an increase of 136,133 since 1869. Moravia is he most densely populated part of Austria-Hungary, portion being 252 persons per square mile. About ent. of the births are illegitimate. The chief towns nn, the capital and industrial centre (82,660 inha), Olmütz, a strong fortress defending the "Moravian (20,176 inhabitants), Znaim, and Iglau.

y.—At the earliest period of which we have any record was occupied by the Boii, the Celtic race which has per d its name in Bohemia. Afterwards it was inhabited by the e Quadi, who accompanied the Vandals in their westward n; and they were replaced in the 5th century by the Rugii ili. The latter tribes were succeeded about the year 550 by Lombards, and these in their turn were soon forced to retire n overwhelming invasion of Slavs, who, on their settlement ok the name of Moravians (German, *Mähren* or *Mähren* river Morava. These new colonists became the permanent nts of this district, and in spite of the hostility of the n the east founded the kingdom of Great Moravia, which siderably more extensive than the province now bearing e. Towards the end of the 8th century they aided Charle n putting an end to the Avar kingdom, and were rewarded ving, part of it, corresponding to North Hungary, a chief rman emperor, who-e supremacy they disacknowledged less for their other possessions. After the death of agne the Moravian princes took advantage of the dis on his successors to enlarge their territories and assert their dence, and Rastislaus (*circa* 850) even formed an alliance Bulgarians and the Byzantine emperor. The chief result liance with the latter was the conversion of the Moravians tianity by two Greek monks, Cyril and Methodius, from Constantinople. Rastislav finally fell victim to f Louis the German, who blinded him and forced him is days as a monk, but his successor Svatopluk (*circa* 890) ally vigorous, and extended the kingdom of Great Moravia der on the west and the Gran on the east. At this period med a strong probability of the junction of the north- and south-eastern Slavs, and the formation of a great power to the east of the German empire. This prospect was dissipated by the invasions of the Magyar hordes in century, the brunt of which was borne by Moravia. The were encouraged by the German monarchs and aided by nsions and mismanagement of the successors of Svatopluk, a short time completely subdued the eastern part of Great The name of Moravia was henceforth confined to the district to which it now applies. For about a century the sion of this marchland was disputed by Hungary, Polan Bohemia, but in 1029 it was finally incorporated with Bo and so became an integral part of the German empire. T the close of the 12th century Moravia was raised to the dig a margravate, but with the proviso that it should be held of the crown of Bohemia. It henceforth shared the fort this country and was usually assigned as an appanage to members of the Bohemian royal house. In 1410 Jobst, m of Moravia, was made emperor of Germany, but died a few after his election. In 1526, on the death of Louis II of Hu Moravia came with the rest of that prince's possessions i hands of the Austrian house. During the Thirty Years' W depopulation of Moravia was so great that after the peace of phia the states general published an edict giving ever permission to take two wives, in order to repeople the cou After the Seven Years' War Moravia was united in one pr with the remnant of Silesia; but in 1849 it was made a se and independent crown land. The most noticeable feature of Moravian history has been the active sympathy of its inha with the anti-Teutonic home rule agitation of the Bohemians. See Bohemia.

Authorities.—Dudik, *Mähren's allgemeine Geschichte* (Brünn, 1860-66); *Die Markgrafschaft Mähren geographisch-statistisch-topographisch dargestellt* (Brünn, 1836-39); Dlouhý, *Dějiny země Moravské* (Brünn, 1872); *Codex diplomaticus et epistolaris Moraviæ* (Brünn, 1836-54); Trnka, *Die Verfassung Mährens* (Vienna, 1872); *Catalogue of the Imperial Statistical Commission* (Vienna).

MORAVIAN BRETHREN, The, are a society of trans whose history can be traced back to the year and their origin found among the reformation movemen Bohemia which followed the martyrdom of John Hu the council of Constance. The beginnings of the Boh Brethren (for that was their earlier name) are som obscure. The followers of Huss broke up into two la one of which, the Calixtines, was willing to acknow allegiance to Rome, provided the "compacts" of the c of Basel permitting the Lord's Supper *sub utraque* were maintained, and in the end it became the na church of Bohemia; the other, the Taborites, refus terms of reconciliation, and appealed to arms. Se from both these were many pious people who were c to worship God in simple fashion, in quiet meetin prayer and Scripture reading, like the *Gottesfreun* Germany, and who called themselves *Brethren*. Boh historians have conclusively shown that the Brethren sent the religious kernel of the Hussite movement, a not come either from the German Waldenses or fro Taborites. Before 1457 many of these quiet Chri were known as the Brethren of Chelcic, and were followers of Peter Chelcicky, a Bohemian, whose rel influence, strongly Puritanic in its character, seems to been inferior only to that of Huss. In that year the true leader, Rokyzana, willing to protect them, per his nephew Gregory to gather them together at Kun near Senftenberg, and form them into a community. meantime was really the foundation of the Brethren or *Unitas*, and its founder Gregory announced that h his companions received and taught the rejection of of the military profession of all official rank, title endowments, and of a hierarchy. They did not p communism, but they held that the rich should g their riches to the poor, and that all Christians shou as nearly as possible in the fashion of the apostoli society at Jerusalem. At the synod of Lhota Reichenau, in 1467, they constituted themselves a church separate from the Calixtine or national chu Bohemia. They appointed ministers of their own c and with the guidance of the Lot, and had an org tion and discipline of their own; at their head was a b who, it is said, received ordination from the Wa Waldenses, but apostolic succession among the Br is one of the most obscure part of their history.

The constitution of the society was revised at a synod held at Lhota under the direction of Luke of P who may be regarded as their second founder. T

ation enabled the society to grow rapidly. In the
years of the 16th century the *Unitas* included nearly
congregations in Bohemia and Moravia with 150,000
rs, and, including Poland, embraced three provinces
emia, Moravia, Poland. Each province had its own
, and synod, but all were united in one church and
ed by the general synod.

Lutheran movement in Germany awakened lively
among the Brethren, and some unsuccessful at
were made under the leadership of Augusta to
ith the Lutheran Church (1528-1546); but when
Jesuit reformation reached Bohemia the Brethren
themselves more in sympathy with it than with the
an. The Jesuit anti-Reformation, instigated by
and his brothers Matthias and Ferdinand, found
thren a prosperous church, but the pitiless persecu
ich followed the unsuccessful attempt at revolution
the whole Protestantism of Bohemia, and in 1627
ing local churches there had ceased to exist. About
e time the Polish branch of the Unity, in which
efugees from Bohemia and Moravia had found a
was absorbed in the Reformed Church of Poland. A
udies, however, especially in Moravia, held religious
in secret, preserved the traditions of their fathers,
spite of the vigilance of their enemies, maintained
correspondence with each other. In 1722 some of
ett home and property to seek a place where they
worship in freedom. The first company, led by
n David, a mechanic, settled by invitation from
Zinzendorf on his estate at Berthelsdorf near Zittau,
ony. They were soon joined by others (about 300
within seven years), and built a town which they
Herrnhut. The small community at first adopted
stitution and teaching of the old *Unitas*. The epis-
had been continued, and in 1735 David Nitschmann
nsecrated first bishop of the Renewed Moravian
. The new settlement was not, however, destined
mply a revival of the organization of the Bohemian
n. Zinzendorf, who had given them an asylum,
ith his wife, family, and chaplain to live among
ugees. He was a Lutheran who had accepted
s pietism, and he wished to form a society distinct
ational churches and devoted to good work. After
gotiation a union was effected between the Lutheran
and the adherents of the ancient *Unitas Fratrum*.
grants at Herrnhut attended the parish church at
dorf, and were simply a Christian society within
theran Church (ecclesiola in ecclesia). This pecu-
is still to some extent preserved in the German
of the church, and the Moravian Brethren regard
ves as a church within the church, or the Brethren's
gation within the Evangelical Protestant churches,
nables them to do evangelistic work without pre
ng. The society adopted a code of rules in 1727,
lained twelve elders to carry on pastoral work,
the revival of the *Unitas Fratrum* as a church.

Statistics.—The Unity of Moravian Brethren at present em
three provinces—German, English, and American. Each
has its own government by synod and provincial elders'
ces; but it forms with the other two one organic whole, and
ore under the control of a general government also. The
synod which governs the whole church, meets every ten
Herrnhut, and is attended by delegates from all the pro-
and from the missions. The elders' conference of the Unity
entres board which superintends all the provinces and the
The present constitution dates from 1857, when the old
tion of the *Unitas Fratrum* was remodelled.

Ministers and Worship.—The ministry comprises bishops, presbyters,
ons. The bishops alone ordain, but they are not
They are appointed by the general synod, or by the
nference of the Unity, and have official seats both in the
of the provinces where they preside, and in the general
Unordained assistants in the ministry, whether men or
women, are formally set apart as acolytes. The worship
geal. Special services are used on the festivals of the eccle
year, on the "Memorial Days" 1st March, 12th May, 1
30th June, 6th July, 13th and 21st August, 16th Septemb
October, and 13th November. Love feasts are still held,
lot was long and the use of the lot in the election of ministe
in marriage have fallen into disuse. The use of the lot in m
was abolished in 1818.

Doctrine.—The Moravian Church has no formal creed,
doctrine is found in the catechisms, in the Easter morning
and in the *Synodal Results*, embracing the following points
by the synod of 1879: (1) that Scripture is the only rule
and practice, (2) the total depravity of human nature, (3)
of God the Father, (4) the real Godhead and the real humi
Jesus Christ, (5) our reconciliation unto God, and our justi
before Him, through the sacrifice of Jesus Christ, (6) the
of the Holy Ghost and the operations of His grace, (7) good
as the fruit of the Spirit, (8) the fellowship of believers
another in Christ Jesus, (9) the second coming of the Lord
and the resurrection of the dead unto life or unto condemna

Work.—(1) *Home Work in the Three Provinces.* This
two divisions, educational work, pecu
mission agencies. In the German
there is a peculiar home mission called the *Diaspora*, whi
from 1729. Its object is missionary. It seeks to excite a
spiritual life by means additional to those provided by th
lished churches, and does not make proselytes nor strive
members from other Protestant churches. The work is carr
Denmark, in Norway and Sweden, in the various parts of G
in the Baltic provinces of Russia, in Poland, and in Switz
In the English province home mission work is conducted
principle of establishing preaching stations in populous place
may ultimately become congregations connected with the
There is also a society for propagating the gospel in Irelan
work in the American provinces is of the same kind.
Brethren have always paid special attention to education
province has a theological college, and there are in the th
nces forty-seven boarding-schools for boys and girls not c
with the Moravian Church. At these school nearly 250
are educated.

MORAYSHIRE. See ELGIN, vol. viii. p. 129.

MORBIHAN, a department of western France,
of part of Lower Brittany, lies on the Atlantic se
between 2° 2' and 3° 15' W. long., and between 47°
48° 12' N. lat., being bounded S.E. by the departm
Loire-Inferieure, E. by that of Ille-et-Vilaine, N. b

d, and W. by Finistère. Its chief town, Vannes, miles west south-west of Paris in a direct line and nal. From the Montagnes Noires on the northern the western portion of Morbihan lopes southward s Finistère, watered by the Quimperlé, the Blavet s affluent the Scorff, and the Auray, the eastern , on the other hand, dips towards the south east in the n of the course of the Oust and its feeders, which o the Vilaine. Though the Montagnes Noires con highest point (975 feet) in the department, the most orographic feature of Morbihan is the dreary, tree reamless tract of moorland and marsh known as the of Lanvaux, which extends west north west to east) with a width of from 1 to 3 miles for a distance miles between the valley of the Claie and that of the fluents of the Oust). A striking contrast to this is afforded by the various inlets of the sea, whose are clothed with vegetation of exceptional richness, g trees, rose laurel, and aloes growing as if in . The coast line is excessively irregular; the of the Vilaine (the longest river of the department), ninsula of Rhuys, the great gulf of Morbihan (from om which the department takes its name, and the of the Auray, the long Quiberon peninsula attached mainland by the narrow isthmus of Fort Penthièvre, ep branching estuary of Etel, the mouths of the and the Scorff uniting to form the port of Lorient, nally, on the borders of Finistère the mouth of the ollow each other in rapid succession. Off the coast slands of Groix, Belle-Isle, Houat and Hoedik. Vessels 13 feet can ascend the Vilaine as far as Redon, vet is canalized throughout its course through the ment, and the Oust, as part of the canal from Nantes t, forms a great waterway by Redon, Josselin, Rohan, ntivy. The climate of Morbihan is characterized t moisture and mildness, due to the influence of the ream

2625 square miles forming the department, nearly one s occupied by moors (*landes*), arable soil forming little more hird part of the whole, meadows a tenth, and woodland th. The horses number 30,000, horned cattle 250,000, 2,000, pigs 60,000, goats 6000, and beehives 76,000. In agricultural produce comprised 5,761,630 bushels of rye 11,170 bushels of wheat, and considerable quantities of eat, oats, potatoes, peas and beans, chestnuts, beetroot, lza, and flax are grown. A little wine also is made, but l liquor of the district is cider manufactured to the extent 13 million gallons per annum). The sea ware gathered e coast helps greatly to improve the soil. Outside of there is little industrial activity in Morbihan, though leather, preserved foods, paper, and chemical products from the sea are all manufactured. Salt marshes give ment to 100 hands and yield on an average 9892 tons of l slate, kaolin, iron ore, and granite are also worked. The and curing of sardines and the breeding of oysters form ness of many of the inhabitants of the coast who also fish ovies, lobsters, &c., for running. There are 154 miles of in the department, and it was intended (1883) that the line ntes to Brest should have branches from Auray to St Brieuc, Quiberon, and from Questembert to Ploërmel. Morbihan d into four arrondissements, — Vannes, Lorient, Ploërmel, tivy — 37 cantons, and 249 communes. The population in s 521,614.

epartments contain so many localities interesting for their l associations. Besides the megalithic monuments of (2800 inhabitants) (*q.v.*) and of Locmariaquer (2050) mentioned Sarzeau (5720) with its castle of Sucinio, one ncient dukes of Brittany, Josselin (2710) with the tomb er de Clisson, constable of France, and of his second wife ite de Rohan, the castle of the Rohans, and in the neighbourolumn in memory of the "Combat of the Thirty;" Guémené d the château of the Rohan Guémené family; Le Palais the chief place in Belle-Isle, containing the château of (Louis XIV.'s superintendent of finance) and the hospital by his wife. Quiberon (2380) is associated with the disaster rench émigrés; Hennebont (6050) has a magnificent railway over the Blavet, and La Roche Bernard (1230) a suspension bridge over the Vilaine, 616 feet long and 108 feet above tides.

MORDAUNT, CHARLES. See PETERBOROUGH, E

MORDVINIANS, more correctly Mordva or M are a people numbering about one million, of origin, belonging to the Ural Altaic family, who the middle Volga provinces of Russia and spread detached communities to the south and east of Their settlement in the basin of the Volga is antiquity. One of the two great branches into they are divided, the Vorse (now Erzya), is men by Ptolemy as dwelling between the Baltic Sea a Ural mountains, whilst the Aorses of Asia occup the same time the country to the north east of the between the Volga and the Jaxartes. Their king to have come with 200,000 horsemen to aid Mith in his wars. Strabo mentions also the Aorses as ants of the country between the Don, the Caspian and the Caucasus. The name of Mordvs is met for the first time by Jordanes, and they were under the same name to the Russian annalist Nestor Russians made raids on the Mordvs in the 12th c and after the fall of Kasan they rapidly invade colonized their abode. The Mordvs now occup Russian provinces of Simbirsk, Penza, Samara, and Novgorod, as well as those of Saratoff and Tamboff their villages are dispersed among those of the Ru and they constitute only 10 to 12 per cent. of the lation in the four first-named provinces, and from 6 per cent. in the last two. They are unequally buted over this area on ethnographical islands, a stitute as much as 93 to 11 per cent. of the popula several districts of the governments of Tamboff, Sim Samara, and Saratoff, and only 2 or 3 per cent. districts of the same provinces. A small number of are found also in the provinces of Ufa, Orenburg, Astr and even in Siberia as far east as the river Tom are divided into two great branches, the Erzya a Moksha, differing in their ethnological features and language. The southern branch, or the Moksha, darker skin and darker eyes and hair than the no A third branch, the Karatayev, is due to mixtur Tatars, whilst a fourth branch, mentioned by authors, is, according to Mareoff, but a local na pure Mordvs. Their language is considered by M. A as the third branch of the Western Finnish family, t other branches being the Lapponian and the Baltic F which last embodies now the languages of the Ka the Tavastes, the Wotes, the Wespes, the Esthes, a Lives. The Mordvs are for the most part com Russified even the Moksha who consider themse the only pure Mordvs, yet they have well main their ethnological features, and can be easily disting even when living completely as Russians. The nearly quite forgotten their own language, only women remembering it among the Mokshas; bu have maintained a good deal of their old nationa especially the women, whose profusely embroidered original hairdress, large earrings which sometim metal, bon-bons, and numerous necklaces covering chest and covering of all possible ornaments ca tinguish them from Russian women. They have dark hair, but blue eyes, generally small and rather The cephalic index of the Mordvs is very near to the Finns. They are brachycephalous, or sub brachy lous, and a few are mesaticephalons. They are fine rather tall and strong, and broad chested. Their chi pation is agriculture; they work harder and (in th of the Mokshas) are more prosperous than their neighbours. Their capacities as carpenters we

in Old Russia, and Ivan the Terrible used them to ridges and clear forests during his advance on Kasan. sent they manufacture in their villages great es of wooden ware of various sorts. They are also asters of apiculture, and the commonwealth of bees ppears in their poetry and religious beliefs. All s are unanimous in recognizing their honesty, y, and sympathetic character, it is noticed also y have remarkable linguistic capacities, and learn eak not only Russian but also several Finnish nish dialects. Nearly all are Christians; they baptism in the reign of Elizabeth, the Nonconn- have recently made many fervent proselytes among But they still preserve very much of their own thology, which they have adapted to a certain ex the Christian religion. They have preserved also, ly the less Russified Moksha, the practice of kid g bride, with the usual battles between the party ridegroom and that of the family of the bride. The of trees, water (especially of the water divinity avoms marriage), the sun or Shkay, who is the chief , the moon the thunder, and the frost, and that to the home divinity Karda. Orko can be seen in e among them, and a small stone altar or flat overing a small pit to receive the blood of slaughtered can be found in very many houses. Their burial s are of a quite pagan character. On the fortieth r the death of a kinsman the dead is not only d to return home but a member of his household, in his dress, plays his part, and, coming from the speaks in his name. The practice of animal sacrifice deep rooted among the Mokshas, who continue to he warm blood of immolated animals.

Mordvy have always been a great attraction for Russian s. Strahlenberg, Georgi, Pallas, and especially Lepekhin ntier about them. Melnikoff has published in several periodicals extracts from his notes, but the number of smaller books have appeared in periodicals, enumerated by Mainoff in the *Izvestia* of the Russian Geoal Society for 1877. Investigated by the Geographical Society study of this race, Mainoff has recently made extensive ological researches into the habits of their customs and -law. The results are published, but not yet in full, in *ia* of the Russian Geographical Society for 1878, and in *odnai Sbornik* for 1879 and *Otechestvennye Zapiski* for 1878 re to appear in full in the *Memoirs* of the Society.

RE, HANNAH (1745-1833), who was born at Stapleton Bristol in 1745, may be said to have made three ions in the course of her long life: first, as a clever riter and witty conversers in the circle of Johnson, ds, and Garrick; next, as an animated writer on and religious subjects on the Puritanic side; and s a practical philanthropist. She was the youngest of the five daughters of Jacob More, a scion of a Norfolk family, who taught a school at Stapleton ucestershire. The sisters established a boarding at Bristol in 1767. Hannah's first literary efforts astoral plays, suitable for young ladies to act, d in 1773 under the title of *A Search after ess*. Metastasio was one of her literary models; pera of *Regulus* she based a drama *The Inflexible*, published in 1774. An annuity from a wealthy set the young lady free for literary pursuits. erses on Garrick's *Lear* led to an acquaintance, lore was taken up by the great female Maecenas, ontague; and her unaffected enthusiasm, simplicity, , and wit won the hearts of the whole Johnson great lexicographer himself being especially fascie- Miss More was petted, complimented, and enged to write. Her ballad, *Eldred of the Bower*, was and quoted by the highest living authorities; e wrote for Garrick the tragedy *Percy*, which was acted with great success in 1777. Another drama *Fatal Falsehood*, produced in 1779 after Garrick's was less successful. In these dramas she borrows Shakespeare situation, imagery, and phraseology greater freedom than modern criticism would tol but they are written with great vigour, freshness effect. Her *Sacred Dramas* appeared in 1782, and the sprightly octosyllabic poems *Bas Bleu* and (1786) mark her gradual transition to more serious of life, which were fully expressed in prose in her *Th on the Manners of the Great* (1788), and *An Estimate Religion of the Fashionable World* (1790). She had been overpowered by the flattering reception given fashionable society; she had received its attentions misgivings and reservations never touching cards, ke Sunday strictly, and preferring company where she have serious conversation; and finally, soon after Ga death, she set herself against theatre going and pretence. There is great uniformity of tone and to her ethical books and tracts. *Strictures on Female tion* (1799), *Hints towards forming the Character Young Princess* (1805), *Celebs in Search of a Wife* nominally a story, 1809), *Practical Piety* (1811), *tian Morals* (1813), *Character of St Paul* (1815), *Sketches* (1818). The tone is uniformly animated writing fresh and vivacious; her favourite subjec minor immoralities, the thoughtless self indulgence infirmities which are rather indirectly than directly ha She was a rapid writer, and her work is consequ discursive and formless, but there was an originali force in her way of putting commonplace observ piety that fully accounts for her extraordinary popu An interesting episode in her literary life was her years' labour in writing spirited rhymes and prose t the *Cheap Repository* series (1795-1798) to counter doctrines of Tom Paine and the influence of the Revolution. Two million of these rapid and sketches were circulated in one year, teaching the p rhetoric of most ingenious homeliness to rely upo virtues of content, sobriety, humility, industry, rev for the British constitution, hatred of the French in God and in the kindness of the gentry. Perhap noblest testimony to Hannah More's sterling wort her indefatigable philanthropic work, her long con exertions to improve the condition of the children benighted districts in the neighbourhood of her c residences at Cowslip Green and Barley Wood, limited her aims strictly, as a good churchwoma anti-Revolutionist, to teaching them to read good and trying to raise their moral tone, but no philanth ever laboured at greater self sacrifice or with purer m In her serene old age, philanthropists from all parts world made pilgrimages to see the bright and amiable lady, and she retained all her faculties till withi years of her death, dying at Clifton on 7th Sept 1833, at the mature age of eighty seven.

MORE, HENRY (1614-1687), one of the most re able and interesting of the "Cambridge Platonists born at Grantham in Lincolnshire in the year 1614. father was "Alexander More, Esq., a gentleman estate and fortune," highly spoken of by his son attributes to his father his own poetical tastes and ge love of learning from his early youth. Both his and mother, he further tells us, were "earnest follow Calvin," but he himself "could never swallow that doctrine." As soon as he went to Eton he gave h up to what he considered a more genial and encou train of religious thought. From his boyhood in th playing fields he was a philosophical and religious dr and he describes his moods of religious reverie in

resting manner.[1] His communings and ecstasies have
orbid taint; they are the natural carriage of a strangely
d spirit. "From the beginning all things in a manner
flowing to him," and his mind, according to his own
ng, "was enlightened with a sense of the noblest
ries in the morning of his day." In 1631 he went
ambridge, and was admitted at Christ's College about
time Milton was leaving it. He "immersed himself
er head and ears in the study of philosophy," and fell
a time into a sort of scepticism, from which, however,
was delivered by a study of the "Platonic writers."
was fascinated especially by Neo-Platonism, and this
nation never left him. The *Theologia Germanica* also
ted a great and permanent influence over him. He
red upon a course of spiritual self-discipline which
e "all his previous studies seem of comparatively no
e, and gradually light as well as peace came to him.
got "into a most joyous and liberal state of mind,"
h he described in a Greek epigram, as he had formerly
ribed his state of mental and spiritual darkness in the
e manner. He took his bachelor's degree in 1635, his
er's degree in 1639, and immediately afterwards was
en fellow of his college. In the position he may be
to have remained all his life. Many offers of preferment
t were made to him, but he refused them all, with one
ption. Fifteen years after the Restoration, he accepted
ebend in Gloucester cathedral but only to resign it in
ur of his friend Dr Edward Fowler, afterwards the
known bishop of Gloucester. He had no ambition,
steadily declined all attempts to draw him towards
ic life. He would not even accept the mastership of
ollege, to which, it is understood, he would have been
rred in 1654, when Cudworth was appointed. He
many young men of a refined and thoughtful turn
ind around him, but among all his pupils the most
esting was a young lady of noble family, a "heroine
l," as his biographer (Ward) says, "of an extraordinary
re." This lady is supposed to have been a sister of
Finch, afterwards earl of Nottingham, a well known
sman of the Restoration. She afterwards became
y Conway, and at her country seat at Ragley in
wickshire More continued at intervals to spend "a
iderable part of his time." She and her husband both
tly appreciated him, and amidst the woods of this
ant retreat he composed several of his books. There
ason to think that the spiritual enthusiasm of Lady
way was a considerable factor in some of More's
ulations, none the less that she at length passed from
religious pupilage into the ranks of the Quakers
eptible to all the excited impulses of her time, this
became the friend not only of More and Penn but of
n van Helmont and Valentine Greatrakes, mystical
maturgists who played a considerable part amid the
ing enthusiasms of the 17th century. Ragley became
tre not only of devotion but of wonder working spirit
m.[2] "Many happy days," More says, he spent in this
radise," and its fantastic mysticism had more allure
s for him than he himself realized. His genius suffered
onsequence, and the play of rationality which distin-
ues his earlier is much less conspicuous in his later
s. He was a voluminous writer both in verse and
e, and the mere list of his works would occupy more
e than we can give to it. Many of his productions
now unreadable; but the *Divine Dialogues*, published
668, may be still read with pleasure. It is animated
sometimes even brilliant, with less prolixity and
ession than his other productions, while it has also
the advantage for modern readers that it embodies
general view of philosophy and religion. Most
characteristic principles may in fact be gathered fr
The year in which he composed the *Divine Di*
may be said to mark the highest point of his intel
activity. His *Manual of Metaphysics* and elaborate
ise on Jacob Boehme and Spinoza were sub equ
this, but the elasticity and freshness of his philos
genius are less buoyant in these efforts, and the pro
mystical elements which were a weakness in his
constitution from the first grew as his years adv
He represents more than any other member of the
the mystical and theosophic side of the Cambridge
ment. His lofty rationality, the rationality of wh
himself had spoken earlier in noble language, was

MORE, THOMAS (1478–1535), lord chancellor, a
of the most distinguished Englishmen of his century
born in Milk Street in the City of London, 7th F
1478. He received the rudiments of education
Anthony's School in Threadneedle Street, at that
under Nicolas Holt held to be the best in the city
was early placed in the household of Cardinal J
archbishop of Canterbury. Admission to the ca
usually was esteemed a high privilege, and was so
a school of manners and as an introduction to the
by the sons of the best families in the kingdom.
Thomas More obtained admission through the influ
his father, Sir Thomas, then a rising barrister and
wards a justice of the Court of King's Bench. Th
prognostication of future distinction is attributed
case of More to Cardinal Morton, "who would of
the nobles sitting at table with him, where young
waited on him, whosoever liveth to see it shall

[1] "Prefatio Generalissima" prefixed to his *Opera Omnia*, 1679.
[2] The place and its religious marvels are glanced at in the romance
Jehan Inglesant (chap. xv.).

l prove a notable accession [1]. At the proper age
g More was sent to Oxford, where he is said vaguely
ave had Colet, Grocyn, and Linacre for his tutors
More himself says that he had Linacre for his master
Greek. Learning Greek was not the matter of course
it became. Greek was not as yet part
arts curriculum, and to learn it voluntarily was ill
d upon by the authorities. Those who did so were
ected of an inclination towards novel and dangerous
of flanking their rite on the Continent and slowly
n, their way to England. More's father, who intended
to make a career in his own profession, took the
he removed him from the university without a
e and entered him at New Inn to complete at
the study of the Law. The young man had been
in a state of humiliating dependence on money
ers, having had no allowance made him, and having
to apply to his father even for a pair of new hose,
the old worn out. This system was pursued
parents not from niggardliness but on principle,
Thomas More in later years often spoke with appro
n of the severe discipline, as having been a means of
ne him from the vulgar dissipations in which his
student indulged. After completing a two years'
in New Inn, an Inn of Chancery, More was admitted
bruary 1496 at Lincoln's Inn an Inn of Court. "At
time the Inns of Court and Chancery preserved the
blance of a well constituted University, and, through
sons under the name of readers and exercises under
name of moots, law was systematically taught
plicitly. In the professional trade More early
shed himself, so that he was appointed reader in Law
rnival's Inn, but he would not relinquish the studies
had attracted him in Oxford. We find Lupset
g a lecture to audiences of "all the chief learned of
ty of London". The subject he chose was a com
son between theology and the humanities, hence St
ustine's *De Civitate*. In this lecture More sought be
pound the theology of his author than to set forth
philosophical and historical contents of the treatise
ecture room was a church, St Lawrence Jewry, placed
s disposal by Grocyn, the rector.

nowhere about this period of More's life two things
ened which gave in opposite directions the determin
mpulse to his future career. More was one of those
susceptible natures which take more readily and
eagerly than common minds the impress of that
they encounter on their first contact with men
principal forms of thought and feeling were at that
conflict, rather unconscious than declared, on Eng
d. Under the denomination of the "old learning,"
atment of the Middle Ages and the idea of church
ity was established and in full possession of the
ion, schools, the universities, and the learned profes
The one that was advancing in the opposite direc-
thout being without the consciousness of a hostile purpose,
he new power of human reason animated with the
d sentiment of humanism. In More's mind both
hostile influences found a congenial home. Each
stium of supremacy, and in his early years it seemed
the humanistic influence would gain the final victory.
t the age of twenty he was seized with a violent
s of devotional rapture. He took a disgust to the
and its occupations, and experienced a longing to
himself over to an ascetic life. He took a lodging
he Charterhouse, and subjected himself to the disci
of a Carthusian monk. He wore a sharp shirt of
next his skin, scourged himself every Friday and
other fasting days, lay upon the bare ground with a
under his head, and allowed himself but four or five ho
sleep. This access of the ascetic malady lasted but a sh
time, and More recovered to all outward appearance
balance of mind. But he never entirely emancipa
himself from the sentiment of devotion, though in la
life it exhibited itself in a more rational form. E
when he was chancellor he would take part in chu
services, walking in their processions with a surpl
This, however, was at a later time. For the moment
balance of his faculties seemed to be restored by a revi
of the antagonistic sentiment of humanism which he
imbibed from the Oxford circle of friends, and speed
from Erasmus. The dates as regards More's early
are uncertain, and we can only say that it is possible t
the acquaintance with Erasmus might have begun dur
Erasmus's first visit to England in 1499. Tradition
dramatized their first meeting into the story given
Cresacre More,[2] that the two happened to sit oppos
each other at the lord mayor's table, that they got i
an argument during dinner, and that, in mutual astoni
ment at each other's wit and readiness, Erasmus
claimed, "Aut tu es Morus aut nullus," and the ot
replied, "Aut tu es Erasmus, aut diabolus!" Reje
me, this legend, which bears the stamp of fiction upon
face, we have certain evidence of acquaintance betwe
in a letter of Erasmus with the date "Oxfo
29th October 1499." If we must admit the correctness
the date of *Ep.* 14 in the collection of Erasmus' *Epistl*
we should have to assume that their acquaintance
began as early as 1497. Ten years More's senior, a
master of the accomplishments which More was ambitio
to acquire, Erasmus could not fail to exercise a power
influence over the brilliant young Englishman. Mo
unconscious demeanour, quick intelligence, and winn
manners fascinated Erasmus from the first, and acquai
ance rapidly ripened into warm attachment. This cont
with the prince of letters revived in More the spirit of
"new learning," and he returned with ardour to the stu
of Greek, which had been begun at Oxford. The humanis
influence was sufficiently strong to save him from wreck
his life in monkish mortification, and even to keep h
for a time on the side of the party of progress. He
gained no inconsiderable facility in the Greek langua
from which he made and published some translatio
His Latin style, though wanting the inimitable ease
Erasmus and often offending against idiom, is yet
copiousness and propriety much above the ordinary La
of the English scholars of his time.

More's attention to the new studies was always sub
dinate to his resolution to rise in his profession, in wh
he was stimulated by his father's example. As early
1502 he was appointed under sheriff of the city of Lond
an office then judicial, and of considerable dignity.
first attracted public attention by his conduct in t
parliament of 1504, by his daring opposition to the kin
demand for money. Henry VII. was entitled, accordi
to feudal laws, to a grant on occasion of his daughte
marriage. But he came to the House of Commons fo
much larger sum than he intended to give with his daught
The members, unwilling as they were to vote the mon
were afraid to offend the king, till the silence was brok
by More, whose speech is said to have moved the Hou
to reduce the subsidy of three fifteenths which the Gove
ment had demanded to £30,000. One of the chamberla
went and told his master that he had been thwarted by
beardless boy. Henry never forgave the audacity; b
for the moment, the only revenge he could take was up

e's father, whom upon some pretext he threw into the
er, and he only released him upon payment of a fine
£100. Thomas More even found it advisable to with-
s from public life into obscurity. During this period
etirement the old dilemma recurred. One while he
oted himself to the sciences, "perfecting himself in
ic, arithmetic, geometry, and astronomy, learning the
ch tongue, and recreating his tired mind with the viol,"
anslating epigrams from the Greek anthology; another
e resolving to take priest's orders.

rom dream of clerical celibacy he was roused by
ing acquaintance with the family of John Colt of
Hall, in Essex. The "home-bred and well-governed"
he daughters attracted him, and the rich humorous
him to prefer the second he married the eldest, not
g to put the affront upon her of passing her over in
ur of her younger sister. The death of the old king
07 restored him to the practice of his profession, and
hat public career which his forensic powers so fitted
. From this time there was scarcely a cause of import
in which he was not engaged. His professional in

e amounted to £400 a year, equal to £4000 in present
ey, and, "from viewing the relative profits of the law
the value of money probably reckoned as high a
on as £100,000 at the present day" (Campbell). It
not long before he attracted the attention of the young
and of Wolsey. The Latin verses which he pre-
ed to Henry on the occasion of his coronation did not
ive particular notice, amid the crowd of congratulatory
. But the zeal with which he pleaded before the
Chamber in favour of the Crown v. the Pope recom-
ded him to the king's favour, and marked him out for
loyment. More took part in this case professedly
rown. Henry even was present in person at the trial,
the good sense not to resent the defeat, but took the
sel to whose eloquence it was due into his service. In
More was made one of the regent's knights, and
n a member of the privy council. He was repeatedly
loyed on embassies to the Low Countries, and was for a
time stationed at Calais as agent in the shifty nego-
ions carried on by Wolsey with the court of France.
1519 he was compelled to resign his post of under-
ff to the city and his private practice at the bar.
521 he was appointed treasurer of the exchequer, and
he parliament of 1523 he was elected speaker. The
ce of this officer rested nominally with the House
lf, but in practice was always dictated by
Thomas More was pitched upon by the court on this
sion in order that his popularity with the Commons
ht be employed to carry the money grant for which
sey asked. To the great disappointment of the court
e remained firm to the popular cause, and it was greatly
ng to his influence that its demands were reduced
n this occurrence may be dated the jealousy which
cardinal began to exhibit towards More. Wolsey
le an attempt to get him out of the way by sending
as ambassador to Spain. More defeated the design
a personal appeal to the king, alleging that the climate
ld be fatal to his health. Henry, who saw through
artifice, and was already looking round for a con-
ular successor to Wolsey, made the gracious answer
he would employ More otherwise. In 1525 More
appointed chancellor of the duchy of Lancaster, and
pains were spared to attach him to the court. The
g frequently sent for him into his closet, and discoursed
him on astronomy, geometry, and points of divinity.
s growing favour, by which many men would have
carried away, did not impose upon More. He dis-

couraged the king's advances, showed reluctance to
the palace, and seemed constrained when there.
the king began to come himself to More's house at Ch
and would dine with him without previous notice. H
mention one of these visits, when the king after di
walked in the garden by the space of an hour, hol
his arm round More's neck. Roper afterwards cong
lated his father-in-law on the distinguished honour w
had been shown him. "I thank our Lord," was the r
"I find his grace my very good lord indeed, and I be
he doth as singularly favour me as any subject within
realm. Howbeit, son Roper, I may tell thee I hav
cause to be proud thereof, for if my head would win
castle in France, it should not fail to go." As a
resource More tried the expedient of silence, dissemb
his wit and affecting to be dull. This had the de
effect so far that he was less often sent for. But
not alter the royal policy, and in 1529, when a succe
had to be found for Wolsey, More was raised to
chancellorship. The election was prompted by More's
reputation, but it was also a repudiant of the moderate
which the policy of the court was then understood
was a concession to the rising popular party, to whi
was supposed that More's politics inclined him.
public favour with which his appointment had
received was justified by his conduct as judge in
Court of Chancery. Having heard causes in the fore
between eight and eleven, after dinner he sat again
receive petitions. The meaner the suppliant was
more affably he would speak to him, and the more spe
he would dispatch his cause. In this respect he form
great contrast to his predecessor, whose arrears he
cleared off. One morning, before told by the officer
there was not another cause before the court, he ord
the fact to be entered on record, as it had never happ
before. He not only refused all gifts, such as had
usual, himself, but took measures to prevent any o
connexion from interfering with the course of ju
One of his son-in-law, Heron, having a suit in the

More thereupon made a decree against him.

Unfortunately for Sir Thomas More, a lord chanc
is not merely a judge but has high political functio
perform. In entering More to that eminent po
ing had not merely considered his professional di
nity had counted upon his avowed liberal and reform
tendencies. In the *Utopia*, which, though written ea
More had allowed to be printed as late as 1516, he
spoken against the vices of power and declared for
preference of religion, creed with a breadth of philosop
view of which there is no other example in any En
man of that age. At the same time, as he could n
suspected of any sympathy with Lutheran or Wick
heretics, he might fairly be regarded as qualified to
the party which aimed at reform in state and c
within the limits of Catholic orthodoxy. But in the
mind the public questions of reform were entirely su
the proposed case of the divorce. The divorce was a
question which Thomas would not yield. And, as he
that the marriage with Anne Boleyn were determined
he petitioned the king "to be allowed to resign the
seal, alleging failing health. With much reluctance
royal permission was given and the resignation acce
10th May 1532, with many gracious expressions of
will on the part of the king. The promise held o
future bounty was never fulfilled, and More left offi
he had entered it, a poor man. His necessitous con
was so notorious that the clergy in convocation voted

ent of £5000. Thu he peremptorily refu-ed, either
nself or for his family, declaring that he "had rather
all cast into the Thames." Yet the whole of his
e after re-igning office did not exceed £100 a year
hereto he had maintained a large e-tabli hment, not
e princely .cale of Wolsey, but in the patriarchal
n of having all his son-in-law, with their families,
he-ted. When he re-igned the chancellorship he
h children and grandchildren together to explain
hese circumstance. "If we wi-h to live together,"
, "you mu t be content to be e mtributors together.
y counsel is that we fall not to the lowe t rate in t:
ll not, therefore, descend to Oxford fare, nor to the
New Inn, but we will begin with Lincoln's Inn
where many right worshipful men of great account
ood years do live full well: which if we find our
the fir-t year not able to maintain, then we will in
ext year come down to Oxford fare, where many
learned and ancient father and doctors are continu
onver-ant, which if our purse fetch not to main
either then may we after, with bag and wallet, go
me together, hoping that for pity some good folks
ve us their charity."

e was now able, a he write to Erasmu, to return
life which had always been hi ambition, when, free
om affairs and public affairs, he might give himself up
favourite studies and to the practice of his devotion
e Chelsea interior Erasmus has drawn a charming
e, which may vie with Holbein's celebrated canvas,
household of Sir Thomas More.

o his built, near London, stood the Thomas a more's yet
thou mansion. There he lived accompanied by his numerous
, including his wife Alice and his second wife, Jane Mid-
ton, and their husband with children and children. There
any man living so ill-creative to his cheerfulness as he, and he
his old wife as well as he were a girl of fifteen. Such, the
ce of his disposition, that whatsoever happeneth that could
helped, he ever therein put his whole pleasant endeavour, though the
ing possible had been done. In Morus's house you would
t Plato's Academy we might rightly call it, only, whereas in the
y the disputations touched upon learning and the power of
es, the house of Chelsea was rightly termed a school of Christian
. In it is none idle man or woman, but reading or studying
eral arts, yet is there no place of piety. There is never any
le, the head of the house seeketh it not by clerk's carriage
rebukes, but by gentle and amiable manner. Every
r is busy in his place, performing his office with alacrity,
ober mirth wanting."[1]

More was too conspicuous to be long allowed to
the happiness of a retired life. A special invitation
nt him by the king to attend the coronation of
Boleyn, accompanied with the gracious offer of £20 to
new suit for the occasion." More returned to attend,
ore that moment was marked out for vengeance
t attempt made to bring him within the meshes
law only recoiled with shame upon the head of the
. They were maladroit enough to attack him on
t vulnerable side, summoning him before the privy
l to answer to a charge of receiving bribes in the
-tration of justice. One Parnell was put forward
plaint of a decree pronounced against him in favour
contending party Vaughan, who he said had pre
a gift cup to the chancellor. More stated that he had
d a cup as a New Year gift. Lord Wiltshire, the
s father, exultingly cried out, "So, did I not tell
my lords, that you would find this matter true?"
my lords," continued More, "having pledged Mrs.
an in the wine wherewith my butler had filled the
returned the cup to her." Two other charges of a
ature were refuted as triumphantly. But the very
y of the accusations must have betrayed to More
the bitter determination of his enemies to compass
destruction. Foiled in their first ill directed atten
they were compelled to have recourse to that tremend
engine of regal tyranny, the law of treason. A bill
brought into parliament to attaint Elizabeth Barton
nun, who was said to have held treasonable langua
Barton turned out afterwards to have been an impos
but she had duped More, who now lived in a superstiti
atmosphere of convent and churches, and he had gi
his countenance to her supernatural pretensions.
name, with that of Fisher, was accordingly included
the bill as an accomplice. When he came before
council, it was at once apparent that the charge of trea
could not be sustained, and the effort of the court age
were directed to draw from More some approbation of
king's marriage. But to this neither cajolery nor thr
could move him. The preposterous charge was urged t
it was by his advice that the king had committed him
in his book against Luther to an assertion of the po
authority, whereby the title of "Defender of the Faith"
been earned, but in reality a sword put into the po
hand to fight against him. More was able to reply t
he had warned the king that this very thing might happ
that upon some breach of amity between the crown
England and the pope Henry's too pronounced asser
of the papal authority might be turned against him.
"therefore it were best that place be amended, and
authority more tenderly touched." "Nay," replied
king, "that it shall not, we are so much bound to the
of Rome that we cannot do too much honour unto
What ever impediment be to the contrary, we will
forth that authority to the utmost, for we have rece
from that see our crown imperial," "which, added M
"all his grace with his own mouth so told me, I ne
heard before." Anything more defiant and exasperat
than this could not well have been said. But it could
be laid hold of, and the charge of treason being
ridiculous to be proceeded with, More's name was str
out of the bill. When his daughter brought him
news, More calmly said, "I' faith, Meg, quod differ
non interest that which is postponed is not dropt."
another time, having asked his daughter how the co
went, and how Queen Anne did, he received for answ
"Never better, there is nothing else but dancing and sp
me." To this More answered, "Alas, Meg, it pitieth
to remember into what misery, poor soul, she will sho
come; these dances of hers will prove such dances t
he will pum our heads off like footballs, but it will no
long ere her head will dance the like dance." So the spe
ium in the *Life* by More's great grandson; but in the
trustworthy record, the life by his son-in-law Roper, Mo
reply ends with the words, "she will shortly come." In t
as in other instances, the later statement has the appe
ance of having been an imaginative extension of the ear

In 1534 the Act of Supremacy was passed, and
oath ordered to be tendered. More was sent for
Lambeth, where he offered to swear to the succession,
steadily refused the oath of supremacy as against his
science. Thereupon he was given in charge to the sh
of Westminster, and, persisting in his refusal, was
days afterwards committed to the Tower. After a c
and even cruel confinement (he was denied the use of
and ink) of more than a year, he was brought to trial be
a special commission and a packed jury. Even so M
would have been acquitted, when at the last mom
Rich, the solicitor general, quitted the bar and presen
himself as a witness for the crown. Being sworn,
detailed a confidential conversation he had had with

[1] *Ep.* 426

[2] Cresacre More, p. 231.

prisoner in the Tower. He affirmed that, having himself admitted in the course of this conversation "that there were things which no parliament could do," viz., no parliament could make a law that God should not be God, Sir Thomas had replied, "No more could the parliament make the king supreme head of the church." By this act of perjury a verdict of "guilty" was procured from the jury. The execution of the sentence followed within the week on 7th July 1535. The head was fixed upon London Bridge. The vengeance of Henry was not satisfied by the judicial murder of his friend and servant, he entered on the confiscation of what small property More had left, expelled Lady More from the house at Chelsea, and even set aside arrangements which had been legally executed by More, who foresaw what would happen before the commission of the alleged treason. More property was settled on Prince Elizabeth, afterwards queen, who kept possession of it till her death. At his death Sir Thomas More was in the fifty-eighth year of his age. He was twice married, but had children only by his first wife. His eldest daughter Margaret married to William Roper, is one of the foremost women in the annals of the country for her virtue, her intelligence, and various accomplishment. She read Latin and Greek, was a proficient in music, and in the sciences, so far as they were then accessible. Her devotion to her father is historical, she gave him not only the tenderest affection of a daughter but the highest admiration and sympathy of a soul great as his own.

It is unfortunate for More's reputation that he ... as a champion of party and sectarian ... strained not entirely to the liberties and ... of the country. Apart from the partisan use which ... made of ... More ... the noble mind of England, ... who bore the ... of a tyrant whose policy he disapproved or whose ... he despised. If his language ... servile than became a freeman, we must remember that ... the courtly style of the period and must not ... literally phrases of compliment. It is however, impossible to deny that More's policy in later life did not ... the more liberal convictions of his earlier years. His view and feelings ... under the combined influences of his professional practice and of public employment. In the *Utopia* published in 1516, he not only denounced the ordinary vices of power, but showed a ... of sentiment which went far beyond the most ... to be found among his contemporaries, pronouncing not merely for toleration but ... even to the philosophical conception of the indifference of religious creed. It was to this ... and not merely to the ... on the administration of Henry VII., that we must ascribe the popularity of the work in the 16th century. For, as a romance the *Utopia* has little interest in the ... of incident or of character. It does not ... his keen ... anticipate the economical doctrine of Adam Smith, and much of it is ... without being either witty or ingenious. Mackintosh ...

"It insinuates a variety of doctrines and ... a multiplicity of projects, which the writer regards with almost every possible degree of approbation and shade of assent, from the ... serious and entire belief through gradations of ... to the slightest probability, where the lowest are scarcely more than exercises of ingenuity, and to which some wild paradoxes are appended, either ... or as an easy mean, if necessary ... disavowing the ... interpretation of the whole of this Platonic fiction."

The *Epistola ad Dorpium* ... a later date ... inclines More emphatically on the side of the new learning. It contains a vindication of the study of Greek, and of the desirability of ... the text of the Greek Testament, views which at that date ... an enlightened understanding to enter into, and which were condemned by the party to which More afterwards attached himself. At the most he can be doubtfully exculpated from the charge of having tortured men and children for heresy. He ... himself that he inflicted punishment for religious opinion ... only ventures to say in his friend's defence "that while he was chancellor no man was put to death for these pestilent opinions, while so many suffered death in France and the Low Countries."

The *Life of Sir Thomas More* was written by his son-in-law Roper about the end of Mary's reign. It was preserved in MS. during the reign of Elizabeth and handed about in copies, many of which were carelessly made. It was not given to the press till 1626, with the date of Paris. Reprints were made by Hearne (1716), by Lewis (1729, 1731), and by Singer (1817, 1822). Roper's life is the source of all the many subsequent biographies. More's *Life* in MS. (Harleian 6253), anonymous, but by Nicolas Harpsfield, was also written in Mary's reign. All that is material in this MS. is taken from Roper. Another anonymous *Life* ... written in 1599, printed in Wordsworth's ... chiefly compiled from Roper and Harpsfield. The preface ... Stapleton (*De Thomæ ...*) ... (*Tres Thomæ*, Douay, 1588) ... Roper (certainly) ... could find ... through ... and letters ... to the writings of his contemporaries. Cresacre More ... Thomæ, compiled ... about the year 1626. He ... but, according to the editor ... *Life of Sir Thomas More* ... how little proof ... an independent authority. ... and Stapleton. The additions ... application of Roper ... derive miracles. The whole ... which the love of the ... upon poor. The author ... that he has received ... after the ... Alfred Gibbs's ... Compositions of the last ... REAU, Jean Victor (1763–1813), the greatest of the French republic after Napoleon and Hoche, born at Morlaix in Brittany in 1763. His father [illegible] in good practice, and instead of allowing [illegible] the army, as he wished, insisted on his [illegible] the university of Rennes. Young Moreau [illegible] for law, but revelled in the freedom [illegible] Instead of taking his degree he con- [illegible] with the students as their hero and leader. In [illegible] he became a person of political importance, the trouble of 1788 formed the law students into [illegible] which he commanded as their provost. In [illegible] became yet more important, and commanded the [illegible] in the daily affrays which took place at Rennes [illegible] the young *noblesse*, who protested against the mode [illegible] on to the tate-général, and the populace. Though hardly weight enough to be chosen a deputy, he [illegible] ence of the committee of correspondence with [illegible] at Paris. He was thus able to follow the [illegible] events in the early days of the Revolution, and [illegible] y impressed with the conviction that no compromise [illegible] court was possible, and a republic the only re- [illegible] These opinions estranged him from his father, [illegible] longed to the party of Breton independence and [illegible] Britanny to France. At last, in 1792, at the [illegible] volunteers he organized a battalion, and was at [illegible] elected its commandant. With it he served under [illegible] nez, and in 1793 the good order of his battalion, [illegible] own martial character and republican principles [illegible] his promotion to general of brigade. Carnot, who [illegible] over the heads of a crowd of generals, promoted [illegible] be general of division in 1794, and gave him com- [illegible] the right wing of the army which, under Pichegru, [illegible] ined to drive the English and Austrians out of Flan- [illegible] separate the Austrians from the French. This wing [illegible] en to cover the occupation of Holland by the main [illegible] under Pichegru. These operations established his [illegible] fame, and in 1795 he was given the command of the [illegible] of the Rhine and the Moselle, with which he crossed [illegible] ine and advanced into Germany. He was at first [illegible] ely successful, and won several victories, but at last [illegible] xembourg before the archduke Charles a retreat which [illegible] reased his fame, as he managed to bring back with [illegible] re than 5000 prisoners. In 1797 he again crossed [illegible] ine, but his operations were checked by the con- [illegible] of the preliminaries of Leoben between Bonaparte [illegible] Austrians. It was at this time he found out the [illegible] s correspondence between his old comrade and [illegible] ador Pichegru and the prince de Condé, which he [illegible] concealed, and naturally has ever since been sus- [illegible] of at least partial complicity. After Fructidor the [illegible] y ceased to employ his services, until the absence of [illegible] ite and the advance of Suwaroff made it necessary [illegible] some great general in Italy. Yet it was only as [illegible] the staff that he served under Scherer and Joubert, [illegible] Brune to Masséna after the latter's death at [illegible] When Bonaparte returned from Egypt he found [illegible] at Paris completely satisfied with the Directory both [illegible] neral and a republican, and obtained his assistance [illegible] *coup d'état* of Brumaire, when Moreau commanded [illegible] e which occupied the Luxembourg. In reward, [illegible] consular government gave him command of the army of the [illegible] with which he fought his last great campaign, that [illegible] enlightened when his success was due rather to the [illegible] l military qualities of his generals and their troops, [illegible] s own tactical genius, than to any inspiration of [illegible] On his return to Paris he married Mdlle. Hulot, [illegible] ortune woman, who gained a complete ascendency [illegible] n, and with the enormous fortune acquired during [illegible] peace he purchased a luxurious hotel in Paris and also Barras's country seat of Grosbois. His wife exercise evil influence over him, and collected around her all who discontented with the aggrandizement of Napoleon. 'Club Moreau' frightened Napoleon, and encouraged royalists, but Moreau, though not unwilling to becom military dictator to restore the republic, would not ha for the restoration of Louis XVIII. All this was known to Napoleon, who seized the conspirators. Mo be treated with real leniency, and permitted to retire to Spain, and then to America. Here the general l in great content for seven years, when his wife, who c not allow him to rest, made him enter into negotiat with Bernadotte, his old comrade, who was now cr prince of Sweden. At his suggestion Moreau entered service of the czar Alexander; and with Bernad he planned the campaign of 1813. Fortunately for tune a patriot he did not live to invade France, was mortally wounded while talking to the czar at battle of Dresden on 27th August 1813, and died o September. His wife received a pension from the and was given the rank of marechal by Louis XVIII

Moreau's military genius stands very high, and from his [illegible] volution, coolness in conducting a retreat he has been called the ge of retreat. His combinations were splendid, and his temperam [illegible] troubled when most closely pressed, but he lacked the sudden [illegible] of striking a victory which distinguished Napoleon in his early [illegible] gns. Moreau was a sincere republican, though his own father [illegible] guillotined in the Terror, and the army of the Rhine was the [illegible] bed of republicanism, as that of Italy was the great support [illegible] military dictator. Moreau had little even of personal [illegible] ition to fill his manner, and would probably not only have s [illegible] Napoleon well but moderated his tendency to absolutism b [illegible] very proper had not the wife ruined any such hope by mixi [illegible] him in intrigues. He was fortunate in the moment of his d [illegible] though he would have been more so had he died in America, [illegible] seem by his final words, "Soyez tranquilles, messieurs; c'est [illegible] ort, not to have regretted being removed from his equ [illegible] petition to a general in arms against this country.

The only authority on Moreau is a pamphlet, the best book being C. Lechimus, *[illegible]* [illegible] Paris, 1814. See also Lebrun, *Campagnes de Moreau*, Paris, 1814; Bertrand de Molleville, *Notices historiques sur la vie politique, militaire et privée du général Moreau*, translated as Philippart, London, 1814; and there are [illegible] in Rocquain, translated into English under the title *[illegible] Directory, Consulate and Empire*. See also *Last Moments* by Paul Svanin, L [illegible] 1814. (H. M.)

MOREL or MORCHELLA. See MUSHROOM.

MORELIA, formerly VALLADOLID, a city of Me capital of the state of Michoacan de Ocampo, is situ 195 miles west by north of Mexico, at a height of 6400 above the sea, in 19° 42′ N. lat. and 101° W. long. [illegible] ite is a rocky hill on the Guayangareo valley, and [illegible] western horizon is bounded by the great Quinceo moun (11,000 feet). Since the middle of the century a conside extension of the city has taken place, especially tow the north; its streets, which run for the most part at angles to each other, had increased from thirty in 187 ninety-nine in 1873. The principal square is the [illegible] de los Martires (formerly de Armas), where Matam was shot by the Spaniards in 1814; its one side is occu by the cathedral (1745), a large building with two to about 200 feet high. The churches of the Carmelites Carmen) and San José are of some note, and of the convents, now for the most part in ruins, several wealthy and extensive. That of the Capuchins is used as a hospital, the old seminary has been turned a state house, and the tobacco factory, one of the ancient buildings in the city, serves as municipal of An important institution, supported by the state, is college of San Nicolas de Hidalgo, originally founde Juan de San Miguel in the 16th century and rebui 1868. The Ocampo theatre dates from 1869–1870. W is brought from a distance of about 3 miles by a aqueduct, constructed in 1788 by D. Antonio de Miguel, but the quality is often deteriorated by the sence of vegetable matter. Morelia lies too far from great natural route to have much commerce in the pr

ate of the country, and its manufactures are limited to e production, on a small scale, of cotton, woollen, and silk oods. A certain delicate sweetmeat called *guayabate* i regular article of commerce to Mexico. In 1750 the city d about 18,000 inhabitants, in 1873 the municipality d 36,940 and the city proper about 30,000, and in 880 the number is stated at 20,100.

In 1541 Mendoza chose the Cerro de Guayangareo (Nueva Valladolid) for the new site of the city of Michoacan, and in 1578 the place received the name Valladolid. Iturbide and Morelos were both born within its precincts; and in 1828 the Government did the latter patriot the honour of renaming the city Morelia. In 1863 it was made the seat of an archbishop. See *Bol. Soc. de geog. de la Rep. M.* Mex., 1873.

MORELLET, ANDRÉ (1727–1819), economist and miscellaneous writer, was born at Lyons on the 7th of March 1727. He was long regarded as almost the last survivor of the philosophe school, and in the character he figures in many memoirs, for instance in Madame de Rémusat's. He was educated by the Jesuits in his native town, then at the seminary in Paris, and finally at the Sorbonne, and he took holy orders, but his dissipation of abbé was the chief thing clerical about him. He early joined the Philosophe party, and was a frequenter of most of them *salons*, being something of a butt especially to his fellow-abbé and rival in political economy, Galiani, but having the credit of a ready and biting pen. Voltaire called him "l'Abbé Morellet." His work was chiefly occasional, and the most notable parts of it were a smart pamphlet in answer to Palissot's scurrilous play *Les Philosophes*, which procured him a short sojourn in the Bastille for an alleged libel on Palissot's patroness, the princesse de Robecq, and a reply to Galiani's *Commerce des Blés* (1770). Later, he made himself useful in quasi-diplomatic communications with English statesmen, and was pensioned, being, moreover, elected a member of the Academy in 1785. The outbreak of the Revolution (soon after which he was engaged in a controversy with Chamfort on the question of the advantages and deserts of the Academy) did not, as it did with many of his friends, drive him from the country or put his life in danger, but it put him in considerable straits of fortune. He maintained a kind of moderate liberal tone, and the return of something like order under the Consulate and the Empire restored him to prosperity and position. A year before his death, at the great age of ninety-two, on the 12th of January 1819 at Paris, he brought out a series of *Mélanges*, composed chiefly of selections from his former publications; and after his death appeared his memoirs, which are of value for the Philosophe period. Morellet, though not a man of extraordinary ability or of specially amiable or estimable character, was in both respects a fair specimen of the man of letters of all work of the time. He was, in fact, a journalist with a special turn for economical subjects.

MORERI, LOUIS. See ENCYCLOPÆDIA, vol. xviii. p. 191.

MORETO, AGUSTIN (1618-1669), Spanish dramatist and playwright, was born at Madrid in 1618. Of his personal and even of his literary history little is known. He studied at Alcalá between 1634 and 1639 and afterwards removed to Toledo, where he entered the household of the cardinal archbishop and took holy orders. Ultimately he withdrew altogether from the world, and died a member of an ascetic religious brotherhood in 1669.

Moreto in his younger years was a prolific writer for the stage, and almost rivalled Calderon in popularity. Three volumes of his plays were printed between 1654 and 1681, and many others besides are attributed in whole or in part to him. He employed all the dramatic forms then in vogue. Of his religious plays, *Los Dichosos Hermanos* (The Most Fortunate Brothers) dramatises the legend of the seven sleepers, may be mentioned as the least bombastic and absurd. Others are *El hostal de Valencia*, turning on the persecutions connected with the introduction of the tobacco plant into Spain, and *María Egipciaca*, a curious representation of the extraordinary legend of St Mary of Egypt. His heroic drama, *El Valiente Justiciero* (The Brave Justiciary), records the exploits of Pedro the Cruel, a king of considerable power. His "comedias de teatro," or "character comedies" (as they are called in vol. xviii. p. 192, include *El Lucero Don Pedro* (The Star Don Pedro) and *El Real sitio y Leales* (Disloyalty Disclaimed), the latter partly borrowed from Lope de Vega's *del Despreciado* and in turn imitated by Moliere (in his *Dépit Amoureux*), by Carlo Goldoni (*Le Trappole per Dilettare*), and by Scribe (*Deux Amis*). The *Cuatro Comedias de los Mejores Ingenios de España* (Madrid, 1676).

MORETTO DA BRESCIA (or The Blackamoor), a term which has not been particularly accounted for, is the name commonly bestowed upon ALESSANDRO BONVICINO (1498–1560), celebrated painter of Brescia, Venetian school. He was born at Rovato in the Brescian territory in 1498, and studied first under Floravante Ferramola of Brescia, afterwards still youthful, with Titian in Venice. His own peculiar method, generally distinguished by excellent colouring, was naturally modelled on that of Titian. He has conceived a great enthusiasm for Raphael (though he does not appear to have ever come to Rome), and his style became partially Raphaelesque. It was, however, a singular combination of diverse elements, and he is best attractive with fine pencilling, a rich yet not lavish use of pearly and decorative effects, and an extraordinary appreciation of light and shade. The human forms are somewhat heavy in Bonvicinese painting, the expression correctly rendered, the flesh tints varied, more so than was common in the Venetian school. The backgrounds are generally landscape, and the drapery well modelled in broad and simple folds with little recurring use of blue. The depth of Bonvicino's talent however was chiefly in proportion to its simplicity and vivacity, and he excelled more in colouring altar-pieces than in subjects of action, and more in oil paintings than in fresco, although one has some of his frescos (especially that in the villa Martinengo at Novagli near Brescia). Among his celebrated works are in the city of Brescia the church of S. Clemente, the Two Virgins Martyrs, the Assumption of the Madonna (the latter many consider his masterpiece), in S. Nazzaro e Celso the Coronation of the Madonna, in S. Maria delle Grazie St Joseph and Mary de Medicis, St Nicholas of Bari. In the Brescian Gallery is a St Justina (sometimes ascribed to Pordenone), in the Städel Institute, Frankfort, the Madonna enthroned between St Arthelais and Sebastian, in the Berlin Museum a colossal Adoration of the Shepherds, and a large picture (one of the master's best) of the Madonna and Child, with infant angels and other figures above in clouds, and believed to be a rich landscape two pictures in the London National Gallery, St Bernardin Angels, and two magnificent portraits. If Moretto is to have been a man of childlike personal piety, proved himself by prayer and fasting for any great act of art, as the biographers of the Venetian painters relate of work extended from 1521 to 1554, and he was then in the prime manhood of the eminent portrait painter Moroni. He died place toward 1560.

MORGAGNI (GIOVANNI BATTISTA (1682–1771), founder of pathological anatomy, was born 25th February 1682 at Forlì, an ancient and important town of Emilia, 30 miles southwards from Bologna. His parents were of respectable circumstances, but not of the nobility, as appears from his letter to Haller that Morgagni's ambitious of gaining admission into the latter rank, and the interest he succeeded from the fact that his father described as a renowned [illegible] at Padua [illegible]. At school he was a favourite pupil of his [illegible] and he was especially noted for his reading [illegible] epigram. At the age of twenty he went to Bol-

[1] A tablet of the house [illegible] the town library [illegible] fourteen [illegible]

philosophy and medicine, and he graduated with
color a doctor in both faculties three years later
He acted as prosector to Valsalva (one of the
guished pupils of Malpighi), who held the office of
demonstrator of anatomy in the Bologna school. He
at Valsalva's more particularly in preparing his cele
work on the *Anatomy and Diseases of the Ear*, which
out in 1704. Many years after (1740), Morgagni
a collected edition of Valsalva's writings, with m
additions to the treatise on the ear, and with a
of the author. When Valsalva was transferred
Morgagni succeeded to his anatomical demon
ship. At this period he enjoyed a high reputa
Bologna. He was made president of the Academia
Inquieti when in his twenty-fourth year, and he
to have originated in imitation of the precedent
Italy by discountenancing abstract speculations and by
the attention towards exact anatomical observa
and examination. He published the substance of his
munication to the Academy in 1706 under the title
De sedibus diagnosticis, the first of a series by which
became known throughout Europe as an
to anatomical research. The book included "Observations
Larynx, the Thyroid Apparatus, and the Pleu
in the Human Body." After a time he gave up his
at Bologna, and occupied himself for the next two
three years at Padua and Venice with anatomical
to be at the latter city), as well as with
try and pharmacy, and with reading in the libraries
then settled in practice in his native town, and soon
ted a large and rapidly increasing practice. There was hardly a
of much difficulty about which he was not consulted
by the older physicians
in praedicendo exitu, et curando febre." Such
in the contemporary eulogy. After less than three
of this career, which he found fatiguing, he sought
portunity of returning to more academical work
dua he had a friend in the elder Guglielmini, pro
of medicine, but later known as a writer on physi
mathematics, whose work he afterwards edited (1719)
a biography. Guglielmini desired to see him settled
teacher at Padua, and the unexpected death of
Imani himself made the prospect feasible. Valsalva
then turned to the vacant chair and Morgagni re
g to the chair of theoretical medicine. He came to
in the spring of 1712, in his thirty-first
ed to taught medicine there with the most brilliant
until his death sixty-five years later (6th December
While he had been three years in Padua an oppor
occurred for his promotion (by the Venetian senate)
chair of anatomy, to which he became the successor
the direct line of scholars including Vesalius,
, Fallopius, Columbus, and Spigelius, and in which
enjoyed a stipend that was increased from time to time
to 1500 scudi until it reached twelve hundred gold
Shortly after coming to Padua he married a lady
noble parentage, who bore him three sons and
daughters. Of the daughters, four died in infancy,
other married as they grew up, of the
one died in her novitiate, one entered the Jesuit order,
resided at Forlì where he married and lived
age of fifty-two, predeceasing his father by five years,
leaving a family to inherit Morgagni enjoyed an
added popularity among all classes. He was of tall
united figure, with blonde hair and blue eyes, and
a frank
tion, his manners were
ed, and he was noted for the elegance of his Latin
He lived in harmony with his colleague, who are
not even to have envied him his unprecedentedly large
, his house and lecture theatre were frequented
"tanquam officina sapientiae" by students of all
attracted from all parts of Europe, he enjoyed the fri
ship and favour of distinguished Venetian senators an
cardinals; successive popes conferred honours upon h
and on two occasions when a hostile army occupied
Emilia his house was ordered to be treated with the s
marked distinction that the great Emathian conqu
bowed to the house of Pindar. Before he had been
in Padua the students of the German nation, of all
faculties there, elected him their patron, and he adv
and assisted them in the purchase of a house to b
German library and club for all time. No person of
learning came to Padua without seeing and conver
with Morgagni and no one ever left him without admi
equally his character and his teaching. One of his
graphers and editors, the celebrated Tissot of Lausa
observes that he had met with several Englishmen
turning from Italy who told with pleasure and grati
"quam humaniter ille exceperat, et quantum ex i
colloquiis, doctis, variis, promptis protecerant." He
elected into the Imperial Caesareo Leopoldina Academ
1708 (originally located at Schweinfurth), and to a hi
grade in 1732, into the Royal Society in 1724, into
Paris Academy of Sciences in 1731, the St Peters
Academy in 1735, and the Berlin Academy in 1
Among his more celebrated pupils were Scarpa (who
in 1842, connecting the school of Morgagni with
modern era), Cotugnius (Cotugno), and Caldani, the au
of the magnificent atlas of anatomical plates publishe
4 vols. at Venice in 1801-1814.

Meanwhile he published on a variety of subjects. In his e
years at Padua he brought out 1717-1719 six series o
le by which his reputation was first m
but for more than twenty years after the last of these he st
medical publications were few and casual (on gall-stones, vari
the conservative care of gout, and several memoranda on medico
points drawn up at the request of the curia). Classical scholar
in these years occupied his pen more than anatomical observat
and the reason of this appears to have been that he spen
some months in the country for the sake of his health, and occ
his leisure with literary studies. His writings in this class in
letter to Cuneus on the manner of Cleopatra's death, commen
on various and sometimes notes on Prosper Alpinus, V
Veratius, Columella and Vitruvius, and antiquarian resea
into the topography of the country round Ravenna and his
birthplace (Forum Livii). His edition of the works of Vals
published in 1740 (in 2 vols. fol.) with plates, occupied mu
his time, being enriched with a life and a commentary, and
many additional observations of his own. It was not until
when he was in his eighteenth year, that he brought out the
work which, once for all, made pathological anatomy a sci
and diverted the course of medicine into new channels of exac
in the *De Sedibus et Causis Morborum per Anato*
He died on 6th December 1771. During the prece
ten years the *De Sedibus*, notwithstanding its bulk, was repr
several times three or four years in its original Latin, and
translated into French (1765), English (1769, 3 vols. 4to),
German (1774). Some account of this remarkable work re
now to be given.

The only special treatise on pathological anatomy previous to
of Morgagni was the work of Theophile Bonet of Neuchatel, *S*
chirurgicae sive Anatomia practica cadaveribus morbo denatis
published (Geneva, 2 vols. folio) in 1679, three years before Morg
was born; it was republished at Geneva (3 vols. folio) in 1700
again at Leyden in 1709. Although the normal anatomy o
body had been comprehensively, and in some parts exhaust
written by Vesalius and Fallopius, it had not occurred to an
to examine and describe systematically the anatomy of dis
organs and parts. Harvey, a century after Vesalius, naivel
marks that there is more to be learned from the dissection o
person who had died of consumption or other chronic malady
from the bodies of ten persons who had been hanged. G
indeed (1651, 1677) shows, in a passage quoted by Bonet in
preface to the *Sepulchretum*, that he was familiar with the
at least, of systematically comparing the state of the organs
series of cadavera, and of noting those conditions which invar
accompanied a given set of symptoms. The work of Bonet
however, the first attempt at a system of morbid anatomy,
although it dwelt mostly upon curiosities and monstrositi

uary 1859, a few weeks before her death, protesting
t being called old. The titles of her books in this
are:—*Fragments* (1829-30), *Dramatic Scenes from Real*
(1833), *The Press* (1835), *Woman and her Master*
), *The Iliad without a Name* (1841), *Passages from*
utobiography (1859). More of her autobiography
any years ago, and letters were edited with a memoir by
ath Dixon in 1862. He respected her prejudice
t disclosing her exact age.

ROMANTIC MARRIAGE. See MARRIAGE.

ROTHLN, RAFFAELLO SANZIO (1758-1833), a distin
d engraver, was born at Naples on 19th June 1758.
ived his earliest instructions from his father, who
engraver, but, in order to be initiated more fully
art he was afterwards placed as a pupil under the
ted Volpato. He assisted this master in engraving
most pictures of Raphael in the Vatican, and the
which represent the miracle of Bolsena are ordered
s name. He married Volpato's daughter, and, being
d to Florence to engrave the masterpieces of the
time gallery, he removed thither with his wife in
His reputation now became so great as to induce
rs of Florence to recommend him to the grand duke
t person to engrave the Last Supper of Leonardo
ci, apart, however, from the disputed fame of
ginal it is, the drawings made for Morghen were
thy of the original, and the print, in consequence,
gh an admirable production, fails to convey a correct
the style and merit of Leonardo. Morghen's fame
ad, soon extended over Europe, and the Institute of
, as a mark of their admiration of his talent, elected
n associate in 1803. In 1812 Napoleon invited
Paris and paid him the most flattering attention-
d at Florence on 8th April 1833.

RHOF, DANIEL GEORG (1639-1691), the learned
of a survey of universal literature entitled *Polyhistor*
[illegible] in 1639, studied law at Rostock, and was appointed
or of poetry there in 1660. In 1665 he went to
University of Kiel as professor of eloquence and
the chair he exchanged for that of history in 1673.
at Lübeck in 1691. Of his numerous writings
Polyhistor continues to be of value to the literary
a biographical work displaying much judgment
[illegible] best even books. *Polyhistor*
[illegible] appeared in 1688-1698, the publication of the
[illegible] part of *De Philosophis* and *De Poetis* was
completed by Morhof [illegible]. The last edition is
J. Fabricius [illegible] 1747.

RIAH. In 2 Chron. iii. 1 we read that Solomon
the Temple [illegible] Mount Moriah (הַמֹּרִיָּה
). The name for the hill on which the ancient Zion,
found elsewhere in the Old Testament, and can
have been a current one. But a mountain in the
of Moriah was the place where Abraham was com
d to sacrifice Isaac, Josephus (*Ant.*, i. 13, 2) a sanc-
ne. Μωρίαν ὄρος was the Temple hill, and the same
s extended in the Targums where it is exegetically
on the obscure verse, Gen. xxii. 14 (comp. Jerome,
Quæst. Heb. in Gen. xxii. 2). Probably this tr
already existed in the time of the Chronicler, who
to connect the name etymologically with Jehovah
le station of humility, as is done in Gen. xxii. 14.[1]

Jerome repeatedly call the Temple hill Mount Moriah,
current which the name has with modern writers has
to the erroneous identification of Zion with the western hill
the Tyropœon. In Christian tradition the place of Isaac's
was identified with Calvary or Golgotha. *De Situ Terræ*
mentions a low tower or chapel adjoining the church of th
Sepulchre.

MORIER, JAMES (1780-1849), traveller and auth
born in 1780. Through the influence of his uncle
William Wabdegrave, Baron Radstock, he at an early
entered the diplomatic service, and as secretary t
Elgin followed the grand vizier in the Egyptia
patch. An account of his Eastern experience w
lished in 1812, under the title *A Journey through*
Armenia, and Part of Asia Minor to Constantinople in 1808
1810 to 1810. In which he was the English representative
court of Persia and after his return he published *A*
Journey through Persia to Constantinople between th
1810 *and* 1816. His knowledge of Eastern life an
ners he also turned to account in the composition of
entertaining romances, displaying some skill in the
ation of Oriental scenery and character, and com
powers of wit and humour. The most popular o
were *The Adventures of Hajji Baba of Ispahan*
The Adventures of Hajji Baba of Ispahan in E
1828, *Zohrab the Hostage*, 1832, and *Ayesha the*
Knife, 1834. Morier died at Brighton, 23d March

MORILLON, a name commonly given by tow
the female or immature male of the GOLDEN-EYE
p. 757), the *Clangula glaucion* of modern ornit
under the belief which still very generally obtains
them, as it once did among naturalists, that they fo
distinct species of Duck. The mistake no doubt ori
in, and is partly excused by, the facts that the bird
Morillons were often of opposite sexes, and differed
from the adult male Golden Eye, whose full and he
place is not assumed until the second year. The word
in French in precisely the same terms, but is in that l
applied to the Tufted Duck, *Fuligula cristata*, and is
according to Littré, from *maure*, signifying black.

MORIN, JEAN, or, in Latin, JOANNES MORINUS
1659), the most learned Catholic theologian of his t
one of the founders of Biblical criticism, was born
at Blois of Protestant parents, acquired Latin and
Rochelle, and continued his studies at Leyden. In
in Biblical and patristic lore, he began to waver
Protestantism, and moved to Paris, where he mad
friend in literary circles, particularly Cardinal Du
to whom his conversion to Catholicism is ascrib
1618 he joined the recently formed Oratorian
where he could give himself to quiet study, and
course took priest's orders. In 1625 he visited
in the train of Henrietta Maria, and in 1640 he
Rome, on the invitation of Cardinal Barberini, a
received with special favour by Pope Urban VII
employed him on the commission for forwarding
ject of union with the Eastern Church. He was, h
soon recalled to Paris by Richelieu, and the rest of
was spent among books in incessant literary lab
health, memory, and intellectual vigour remaining
paired even in old age. His pen sometimes broug
into trouble. The *Histoire de la délivrance de*
Chrestienne par l'emp. Constantin, et de la gran
souveraineté temporelle donnée à l'Eglise Romaine
rois de France (1630) gave great offence at Rome

[1] The word Moriah however, can hardly come from רָאָה, "
is perhaps akin to Morel, "provider," "teacher."

ution (1651), directed against faults in the adminis of the Oratory and reflections on the general (Father ong), was strictly suppressed. So, too, his great work ance gave equal offence to the Jesuits and to Port- and even after his death (1659) the polemical ence of his *Exercitationes Biblicæ*, and the exaggera his assertion "sapiunt neoterica. Hæreticos verbe narum non est integra, non apothecæ non lotia, senum, medullam et lodices narium" hence led ants to treat his valuable contribution to the history Hebrew text as a mere utterance of Popish prejudice. us was a voluminous and pedantic writer, and his Pros His principal work on Port- *de disciplina et administ* *causis* and *Opus* *Exercitationes Ecclesiasticæ* and of these would appear to be the ot ordination, etc., to commemorate the visit of Queen Henrietta Maria of Orange, upon the occasion of her *Liturgia Ecclesiæ* and his Hebrew lexicon, *Lexicon Samaritanum*, are also of value. Morin's most famous work is his *Exercitationes Biblicæ de Hebræi Græci et Samaritani Textuum Originis, Integritate, Auctoritate et Editionibus*, published at Paris in 1633, and dedicated to Louis XIII. In this he argues that the Hebrew text of the Old Testament, as we have it, is substantially identical with the original Hebrew text as it left the hands of Ezra and the Great Synagogue, and that the Septuagint version is based upon a Hebrew text which differed considerably from the Hebrew text as we have it. The work is learned and laborious, but its conclusions are not convincing. Morin's other principal works are his *Commentarius Historicus de Disciplina in Administratione Sacramenti Pœnitentiæ* (Paris, 1651), a treatise on the history of penance, and his *Antiquitates Ecclesiæ Orientalis* (Paris, 1682), a work of great learning, but marred by the author's credulity and his uncritical use of his authorities. Morin's *Commentarius de Sacris Ecclesiæ Ordinationibus* was published at Antwerp in 1695, and his *Commentarius de Disciplina Pœnitentiæ* at Brussels in 1703.

MORLAIX, the chief town of an arrondissement of Finistère, France, lies 38 miles west of Brest on the railway from Paris to Brest, and at the confluence of two small streams 7 miles distant from the sea. The port has 13 feet of water at ordinary and 23 feet at spring tides. The entrance of the roadstead is guarded by the Château du Taureau, which stands on a rock in the bay and was built in 1542 to protect the town from the English. Morlaix still contains a considerable number of old wooden houses of the 15th, 16th, and 17th centuries. The most striking piece of

MORLAND, George (1763–1804), animal and painter, was born in London on the 26th of June 176 came of a race of artist. His father, a painter, me engraver, and picture dealer, gave him a careful art t and at an exceptionally early age he produced w wonderful promise. At sixteen he exhibited h the Royal Academy, and even before this his pict found ready purchasers; and some of them ha engraved. But already the taste for dissipation, was stronger in Morland than even his love for a began to manifest itself, and at seventeen he escape the strict discipline of his father's house and a career of reckless prodigality which has hardly a in art biography, for he came round him an *entourage* most fashionable companions, and supporting himself sale of the pictures which he painted. His subjects and scenes f his whole life threw a halo of romance around the o there appeared to be one prospect of amen He went to reside at Kentish Town, came under the ence of better companions, and married the sister of Nattes, and a sister of James Ward the eminent and William Ward the engraver. The style of Morland painted during the period when he was at the h way of life. The folly and frolic, true, M and Peters on seduction, revelries in the He hurdle, were executed at Hampstead exceedingly p But soon the tide of ill luck began to set in. Mor for freedom and began to return to the habits redoubled sobriety, and to paint with untiring ardour and intemperance. The more he did the less he got not wanting, the dealers were ever ready to purch indeed, so eager were they deemed that keen were employed to watch the moment when the p on which he was at work, when it was sold and an unfinished picture. The time of Morland's career from 1790 to 1795 he painted the of a Stable now in the Vernon Gallery, probab several times repeated. So great was his popularity a reduction in prices became necessary, and a time he obtained the highest sum ever paid in November 1791 he was arrested. Obscure th of the law he had been within bounds, an turned to pecuniary difficulties and by drunkenness was released only by the Insolvent Act of 1802, health was ruined. He was speedily stricken with t, but he [illegible] he was [illegible] for [illegible] at [illegible] house in Eyre Street, Cold Bath Field, on the October 1804. His wife survived him only some days, and they were buried in one grave.

[illegible] of Morland are those which [illegible] with [illegible] [illegible] [illegible]

On 6th April 1830 the ...ation of the new ... by their neighbours ..., but by them ... Latter Day ...of Jesus Christ, was ... at Fayette, Seneca county, ...rk, and in the same year another revelation was ...d by Smith, proclaiming him "seer, translator, ..., apostle of Jesus Christ, and elder of the church," ...now began to baptize. But, his character, which ...one of the best, being too well known in Fayette, he found it convenient to remove with his followers, thirty in number, to Kirtland, Ohio, which was ...the seat of the New Jerusalem. Here he had a ...revelation, directing the saints to consecrate all their property to God and to start a bank. This being done, Smith appointed president of the bank, the country was flooded with worthless notes, which fact, added to other irregularities, incensed the neighbouring Christians, and on the night of 23rd May 1832 a number of them dragged Smith and Rigdon from their beds, tarred and feathered them. One year later, the ... was further incensed with the three presidents Smith, Rigdon, and Frederick G. Williams, who were styled the "presidency," and entrusted with the keys of the kingdom. About this time the heretofore ... might have led to the dissolution of the church but for the accession of Brigham Young, a Vermont painter and glazier thirty years old, who settled in Kirtland in 1832, and immediately attained to the "Young" indomitable will, ... character, creative ability, brawniness, and ... reliance left, and, when a further step was ... to be toward the consummation of a theocratic ... dictatorship of the "twelve apostles," were sent out to preach the new revelation, the ... Young was ordained one of the "twelve" and ... despatched to preach Mormonism throughout the eastern States. In a large temple ... consecrated in Kirtland, and in the ... year Orson Hyde and Heber C. Kimball were ... missionaries to England, where among the labouring ... in Manchester, Liverpool, Birmingham, Preston, Glasgow, ... and the mining districts of South Wales they achieved ... remarkable success. Early in 1838 the Kirtland ... Temple, and Smith and Rigdon fled to Caldwell county, ... Missouri, where a large body of the saints, after having been driven successively from Jackson and Clay counties, had taken refuge and formed a settlement. Smith's troubles, however, continued to increase. His gross profligacy ... many of his leading supporters and bred much ... dissension, while from the outside the brethren were ... and threatened by the steadily growing hostility ... of the native Missourians. To counteract the effects of ... enemies, a secret society was organized in Smith's ... in October 1838, called the Danites, with the ... purpose of supporting Smith at all hazards, of upholding ... the authority of his revelations and decrees as superior to ... the law of the land, and of helping him to get possession ... first of the State, then of the United States, and ultimately ... of the world. To such a height did the inner dissensions ... and the conflicts with the "gentiles" grow that they assumed ... the proportions of a civil war, and necessitated the calling ... out of the State militia. Defying the legal officers, they ... fortified the town and armed the saints, but finally, ... succumbing to superior numbers, Smith and Rigdon were ... arrested and imprisoned on a charge of treason, murder, ... and felony, and their followers to the number of ... crossed over into Illinois and settled near Commerce in ... Hancock county. Here they were shortly afterwards rejoined by ... Smith, who succeeded in escaping from prison, and, having ... obtained a charter they founded the city of Nauvoo. The ... powers granted them by this charter were so ample as to make ... the city practically independent of the State Government, ... and to give Smith all but unlimited civil power. They ... organized a military body called the Nauvoo legion, of ... which he constituted himself commander with the rank of ... lieutenant-general, while he was also president of the ... church and mayor of the city. On 6th April 1841 the ... foundations of the new temple were laid, and the city ... continued to grow rapidly in prosperity and size. But ... Smith's vices were beginning to bear fruit. Some time ... previously he had prevailed on several women to

him, and in order to pacify his lawful wife and silence objections of the saints he had a revelation on 12th 1843 expressly establishing and approving polygamy. proclamation of the new doctrine created wide prejudice, which found special expression in the press. one *Expositor*, a newspaper published by an old friend Smith, one Dr Foster. Smith at once caused the *Ex* printing-office to be razed and Foster to police on which the latter procured a warrant for the arrest of Smith, brother Hyrum, and fifteen others. Smith resisted militia was called out, the Mormons armed themselves a civil war seemed imminent when the governor of State persuaded Smith to surrender and he and Hyrum accordingly, on 27th June 1844 he and Hyrum were murdered in Carthage jail but that night a mob broke into the prison and beat the two men dead. The thing was the most fortunate there that had ever happened to the Mormon cause. It threw the murderers dent with the halo of martyrdom, and effected a political election of his successor to the interest of the Mormons. the confusion that followed Smith's murder the Mormons profited by procuring the removal from the penitentiary by the connivance of the Governor, upon which his splendid services obtained for him a pardon. subsequent events constantly proved. He subsequently witnessed what appeared to be the culmination of misfortunes. The legislature of Illinois repealed charters of Nauvoo and created out of the territory one that the leaders resolved to concentrate promptly, and preparations were made for a general exodus. ward. Early in 1846 a large number of the Mormons at Council Bluffs, Iowa, and those who had travelled and soon found cause to regret that they too had left Nauvoo, as in the September of the same year city was cannonaded, and the Mormons were driven

Meanwhile pioneers had been despatched to the at Salt Lake valley Utah, and their report proving favourable, a large body of emigrants was marched with military discipline across the wilderness to the valley, where they immediately proceeded to found Great Salt Lake City, where on 24th July 1847 they were joined by their of, Brigham Young. In the May following the main body of the saints set out to rejoin their brethren, and in autumn of that year reached Salt Lake City. Large lots of land were at once put under cultivation, a great city sprang up as by magic, and the untiring industry, energy, and zeal of the emigrants turned a barren wilderness into a fertile and blooming garden. An emigration was organized, missionaries were sent out and converts began to pour in from all quarters of the globe particularly from Great Britain, Sweden and Norway, and less numbers from Germany, Switzerland, and France. Strangely enough, and the fact deserves emphasis, Ireland furnished few if any recruits to the cause of Mormonism.

In March 1849 a convention was held at Salt Lake City, and a State was organized under the name of Deseret, meaning "the land of the honey-bee." A legislature was elected, and a constitution framed which was sent on to Washington. This Congress refused to recognize the new way of compromise for declining to admit the prospective State into the Union. President Fillmore in 1850 organized the country occupied by the Mormons into the territory of Utah, with Brigham Young as governor. District judges were also appointed by the Federal Government; but in 1851, a few months after their appointment, they were forced to leave by the aggressive tactics of the Mormons. Such bold defiance of the Federal Government could not be ignored; Brigham was suspended from the governorship, and Colonel Steptoe of the United States army appointed in his stead. The new governor, backed by a battalion of soldiers, arrived in Utah in August 1851, but no stronger was the opposition which he met with that he dared not assume office, and was forced to content himself with merely wintering in Salt Lake City, after which he withdrew his troops to California. Nor did the other civil officers appointed by the United States Government at the same time show any bolder front. In February 1857 a band of armed Mormons broke into the court-room of the United States district judge, and forced Judge Drummond to adjourn his court *sine die*. He subsequently precipitated the flight of the other civil officers, and with the exception of the United States Indian agent withdrew from Salt Lake City. The outcast Executive Buchanan to appoint a new governor in the person of Alfred Cumming, the superintendent of Indian affairs in the upper Missouri who in 1857 went to Utah, accompanied by Judge Eckels of Indiana, a civil service by a force of 2000 soldiers. Incensed by this action, Brigham Young hastily called the militia to arms in September the United States army reached Utah, and 6th October a band of mounted Mormons destroyed a number of the supply trains, and a few later cut off 800 cows from the army now commanded by Colonel A. S. Johnston, compelled it to encamp for the winter of November to go into winter quarters at Black Fork near Fort Bridger. In the spring of 1858 a party of Mormons under Lot Huntington and led by a Mormon bishop named John D. Lee, captured a train of 150 wagons belonging to Messrs Myers & Co. at Mountain Meadow, near Utah Lake, and murdered every soul. Governor Cumming soon succeeded in persuading the Territory to submit to the authority of the United States, through the mediation of Thomas L. Kane of Pennsylvania, armed with a letter of authority from President Buchanan, the Mormons were induced to submit to the Federal authority, accepted a free offer of pardon made to them by the United States Government at the conclusion of their submission. Matters being thus settled, the Federal troops encamped on the west or shore of Lake Utah, some 40 miles from Salt Lake City, where they remained until withdrawn from the Territory in 1860. On the close of the American Civil War a Federal governor was again appointed, and in 1862 polygamy was declared to be a misdemeanour, and Brigham Young was arrested. This action, however, on the part of the United States Government was merely pro forma, the Mormons continued to practise polygamy and to increase in wealth and numbers, and in 1867, when Brigham Young died leaving a fortune of £2,000,000 (£1,000,000) to his wives and children. He was succeeded as prophet by John Taylor, as High Priest, although, as real leader he fell to George Q. Cannon, who must also be regarded as the ablest Mormon of all. The year 1872 was otherwise remarkable in Mormon history by the final secession, and excommunication of John Le, for the Mountain Valley murders of 1857. Of late years the agitation of Mormonism has largely occupied public attention. In 1872 Mr Lochnbar introduced a bill for the complete suppression of polygamy, and declaring that marriages contracted in accordance with the rites of any religious body should be void. In 1874 the committee of the House of Representatives reported a bill which reduced Utah to the position of a province, placed the control of affairs in the hands of Federal officials, and practically made bigamy, the same year George Q. Cannon was elected a delegate from Utah, and though his election was contested was confirmed by the House of Representatives. This decision, however, was accompanied by the passing of a resolution by a vote of 127 to 51, appointing a committee of investigation into Delegate Cannon's alleged polygamy. It has

MORO, ANTONIS (c. 1512–1568), otherwise known as Sir Antonio Moor, an eminent portrait painter, was born at Utrecht, according to some, but in 1520 according to Van Mander in his *Het Leven der Schilders*. He studied his art under Jan Schoorel, and after making a professional visit to Italy he commenced to paint portraits in the style of Hans Holbein. His rise to eminence was rapid. In 1552 he was invited to Madrid by the emperor Charles V. to execute a likeness of Prince Philip. Two years afterwards he was in London painting the portrait of Queen Mary. For this picture an annual salary and, as some suppose, the honour of knighthood were conferred upon him. He was also employed to sketch the likenesses of several of the English nobility. On the death of Mary in 1558 Moro returned to Spain, and lived there for two years in great honour with Philip II., executing, in addition to portraits, several copies after Titian. Having compromised himself with the Inquisition, he repaired to the Netherlands, and was received into the service of the duke of Alva. His death took place at Antwerp about 1568. Among his figure pictures Van Mander specifies the Crucifixion of Christ, executed for Antwerp cathedral, as one of the most notable. His portraits are full of individuality and characterized by firm and solid rendering of flesh. Several admirable examples are preserved in Madrid, among the best the portrait of Queen Mary of England, which has been excellently etched by Mr Lucas (1st December 1878). Moro's style, says Stanley in his *Dutch and Flemish Painters*, "so much resembles that of Holbein as to frequently create a doubt to which of them a portrait is to be attributed, but he is not so clear and delicate in his drawing (perhaps from having painted so much in Spain) as that master."

MOROCCO, or Marocco, the term corrupted from the name of the city Marrakush, used in English to designate the Maghrib al Aksa or extreme west of the Arabs, the country at the north-western corner of the African continent, with the Mediterranean on the north and the Atlantic on the west. Its landward limit can only be vaguely defined. The eastern frontier toward Algeria, determined by the treaty of 1845, is a purely conventional line, starting from the mouth of a small stream called the Sikkak and running across country in a general south-east direction. The southern boundary, ever expanding and contracting according to the power and activity of the central authorities, Behm and Wagner (1882) who include Tafilelt, Kenatsa, Figig, Twat, Touat, Tidikelt, the plateau of Tademait, &c., estimate the total area of the sultanate at 309,548 square miles, and this, which is about twice the size of Algeria, or five times that of England and Wales, may be taken as a maximum. The allegiance of many of the tribes within this compass is questionable and intermittent. Morocco is still the portion of Northern Africa about which European information is most defective, and the ordinary maps are composed to a large extent of most unscientific material eked out by probabilities and conjecture. Since the middle of the present century a good deal has been done in the way of exploration, mainly in the lowlands and steppes toward the Atlantic, the country of the great historic cities of Tangier, Fez, Mekinez (Mequinez), and Morocco, but even there what lies but a few miles east or south of some track traversed by Europeans for centuries is a matter of conjecture.

Since the publication of Arlett's survey from Spartel to Cape Bojador (1840–41) and of Vincendon Dumoulin and Kerhallet's surveys from the Strait of Gibraltar to the Algerian frontier (1853–57) the seaward face of Morocco has been known in detail. To the Mediterranean it presents for a distance of about 200 miles a rugged profile of the Rif hills (still unexplored), generally end on lines of cliff broken at intervals by long sweeps of sandy beach, but occasionally open up into fruitful and fertile valleys, with abundant evidence of ancient occupancy and tillage. About 6 miles west of the Algerian frontier lies the mouth of the great river Muluya, and 10 miles further on, opposite Cape del Agua (Ras Sidi Ben Sakkom), a group of dry and barren islands known as the Zaffarines, which form the best roadstead on the Rif coast. Between Point Quiviana and Melilla runs a low and sandy shore in front of a great salt marsh, the Puerto Negro of the Spaniards. Melilla (Mahlaa) is a fortified town held by the Spaniards since 1563, built on a rocky peninsula and connected by lines of rampart with Fort Rosario on the heights behind. Near the village of Azanen is the open shore with the only sand-dunes on all this coast. The fine semicircular bay of Alhucemas is the site of one of the most beautiful valleys in the Rif, well wooded and dotted with handsome villas. A Spanish fortress occupies one of the larger of the Alhucemas islands (Mazemma), which are identified with the Ad Sexsi of the itineraries. Another Spanish fortress crowns the rocky island of San Antonio or Penon de Velez; in the valley off which it lies stood a town known to the Spaniards as Velez de Gomera, to the Arabs as Badis, which continued to be a place of importance in the 16th century. The so-called Bay of Tetuan (Tettawin), the town of which is visible from the sea, is little more than the straight coast between Cape Mazari on the south and Cape Negro or Negrete on the north, but the prominence of the headlands gives it an appearance of depth. From Negro northwards to Ceuta the most notable object on the horizon is the summit of Jebel Músá, which, situated on the Strait of Gibraltar, towers above the [illegible] hills. Ceuta (Sebta), the most important of the Spanish settlements in Morocco, stands on a peninsula, the head, Mt. Acho, standing about a mile out to sea, and the neck being low and narrow. In the eastern end of the strait. Westwards, the first point of interest is again Jebel Musa, the Elephas of Strabo, the Apes Hill of English charts, the truncated summit usually hid in clouds. About 20 miles farther along the coast lies the Bay of Tangiers (Tanja), by far the best harbour in Morocco. West from Tangiers runs the Jebel Kebir (880 feet at its highest), the seaward extremity of which forms the celebrated Cape Spartel, the northern angle of the African continent, known to the ancients as Ampelusia or Cotes Promontorium. The lighthouse, built in 1861 at the cost of the sultan of Morocco, and maintained at the joint expense of England, France, Italy and Spain, is the only one on the western coast.

The Atlantic coast of Morocco is remarkable for its regularity and sameness; not a single gulf or notable estuary occurs throughout its whole length; the

[1] The name is derived from the Arab tribe of the Beni Jaffar settled on the neighbouring mainland at the conquest. Since then the island have belonged to Spain. They are identified with the Tres Insulae of the Roman itineraries.

v and for the most part feebly marked. South rom Cape Spartel the shore sinks rapidly till it a few feet of the sea-level. In the low cliff which s about 4½ miles from the lighthouse there is a narry, which from remote antiquity has yielded the nills used in the Tangiers district. A stretch of ushy ground along the Tahaddart the estuary of di Kebír (W. Mubarhar) and W. al Kharrub agrees eylax's Gulf of Cotes (Tissot). Three or four miles south lie the ruins of the town of Nebrodh, built by from Andalusia, and 4 or 5 miles more bring us to or Arzilla, the ancient Colonia Julia Constantia Zilis. Since its bombardment by the Portuguese in 1829 been a wretched little place, with a mixed Moorish ewish population of about 1200. For the next 16 between Azila and Larash or El Araish (see) the as a tolerably bold background of hill, Jebel Sarsar forming an important landmark for the latter town, with its Phoenician, Roman, and mediæval remains, rically one of the most interesting places in Mo of reddish cliffs about 300 feet high runs south out 10 miles from the W. Anjera, at whose mouth s built; then the coast sinks till at reache Mula lham, an eminence 220 feet high. Between Mula lham (often wrongly called Old Mamora or Mamore) similar height crowned by the tomb of Sidi Abd Jebli lies the outlet of the Blue Lake (Maja Zerka), 12 miles long. Further south, and separated from a by an unbroken line of rounded hills (230-260 s the much more extensive lagoon of Ras al Duma, in the dry season becomes a zone of marshy acres, the rainy season fills up and discharges into the Eastward it is connected with the Marjat al Ghaila, the W. Medas. On the south side of the outlet of ebú lies Ma'múra, probably founded by 'Abd al n, and originally named Mahdiya, after the Almohade . Twenty miles farther s. the mouth of the Bu k, with its cluster of interesting towns. Salle (Salat) north side, long famous for its pirates and still one most fanatical places in the empire, and on the south New Sallee (Rabat) with its conspicuous tower of , and Shella (Sella of Leo Africanus) with its interruins. Onward for 100 miles to Point Azammur e mouth of the Umm Rabí' river a line of hills skirt ; the shore is for the most part low, and, with the ion of capes at Fedala (a small village) and Dar al or Casa Blanca, it runs in a straight line west-south Casa Blanca, the ancient Anfa, once a flourishing was named by the Portuguese (1468) in reverence for acies. It is now a place of 4000 inhabitants, and thriving export trade in maize, beans, and wool. European colony of about 100 persons. Azammur s, in Berber, "The Olives," viz., of the Shekh Bu o, with 1000 inhabitants, dependent on the shoals es in the river, stands on an eminence about 1½ from the sea on the south side of the Umm Rabí ay of Mazagan (Mazíghan), a few miles to the south, westward with a boldness of sweep unusual on the The town of Mazagan was founded by the Portu in 1506, and held by them till 1769. About 8 to the south and less than a mile inland lie the sive ruins of Tit, a town which proved a thorn in de of the people of Mazagan till they sallied forth and destroyed it. At Cape Blanc (so called from white cliffs) the coast, which bulged out at Cape Mazag again bends east to resume much the same gene direction for 55 miles to Cape Cantin. On the stre the only point of interest is Wahdiya, formerly Al Gha the excellent harbour praised by Edrisi is formed by extensive lagoon, and M. Tissot thinks that by a li dredging the place would again become the safest a ping station on the whole Morocco seaboard. Beyo Cape Cantin (300 feet high) the coast becomes bolder more irregular, especially after the mouth of the Tens passed. About 18 miles farther is Safi (Asfi), by the most picturesque spot on the west coast, with the h wall and square towers of its Portuguese fortifications shown to advantage by the ruggedness of the site. Saf of Mogador (q.v.) and onwards beyond the limit of Moroc the coast, becomes ever more and more macadamizable dangerous in winter, as emphatically known as the I Coast. From Cape Sim or Ogueir Ba Tarawalt), 10 mi south of Mogador, the direction is due south to Cape (Ras Ut'ama) the termination of Jebel Idrá Tamara Ra Mardochee), the last spur of the Atlas proper. Round this headland we reach Agadir (Agadir n Ifrán, the Sa Cruz Major or Santa Cruz de Berberia of the Spaniar formerly known as the Gate of the Sunset. It is a fi town with white battlements, three-quarters of a mile circumference, on a steep eminence 600 feet high. the 16th century it was seized by the Portuguese, Don Manuel caused it to be fortified, but in 15 was captured by Muley Mahdan Ahmed al Hasan merchants were removed to Mogador in 1773. At mouth of the Sus Leo places three little towns called Me (Massa), with a mosque popularly reputed the scene Jonah's recreation to *Cetus ceto nec*. The port of this nam regularly visited by the Genoese traders in the 16th centu who exported lime, gum, wax, gold, and indigo. Immedi at the mouth of the W. Massa 20 miles farther south Ifrán, situated in 29° 23' N. lat., and Sidi Wonzek, the C Non of the Portuguese are the only points calling notice till the better known Cape Nun is reached, which 5 or 6 miles north of the W. Draa. With the Draa Sahara may be said to begin.

On most maps of Morocco is represented extremely mountainous; but, while it is traversed from to west by more than one sharply defined range, the gr part of the surface is really occupied by undulating ter like tracts divided by low hills. The backbone of country is the Great Atlas, Dyrin of the Berbers, its western extremity the range averages from 1000 5000 feet in height, after a slight falling off for a mile it rises till at Aremd an elevation of 10,000 f beyond the pass (about 60 miles from the coast) which b from Morocco to Taroudant the summit seems to be betw 11,000 and 11,500 feet, about 10 miles farther east i a second pass at an altitude of about 7000 feet, beyond that the mountains continue 30 miles at a hei of about 12,000 feet, with a few peaks reaching to 13 or 13,800 feet. Snow lies on some of the summits a

Pliny says the natives call the Atlas "Dyrin."

s, but it is probable that none of them retain it
hout the year. Taken as a whole, the Atlas has a
elevation higher than that of any other range of
en th in Europe or in the African and Asiatic
- bordering on the Mediterranean. From the
ls to the north it has a very fine appearance, rising,
ems, in steep and almost abrupt ascent, though the
tance from foot to summit is a slope of 15 miles
e the panorama prefixed to Hooker and Ball's
)

- the culminating point of the range is quite unknown, the
peak has never been ascertained. The English embassy
1 30 advanced up the northern slope only a little beyond
ant (5,031 feet), and Davidson in 1850 merely reached the
el then turned westwards. From Tasermant eastwards the
altogether unexplored for 200 miles till we come to the
flows by Aïn-el-Hadjar at Mount Ta'ya, Caillé (1827),
ibid. 563). The English expedition of 1871 (Hooker and
) beside visiting Tasermant, went up the Dra'a valley to
of 4,000 feet, up the Ait Mgun valley to the Tagherot pass
, and up the Amzaz valley to the summit of Jebel Tezeh
feet. In the Tagherot pass Mr Maw was the only one of
y who reached the watershed, but from Jebel Tezeh a good
s obtained southward across the great valley of the Sa to
Atlas, which appeared to be from 9000 to 10,000 feet high.
Du Leon crossed the range by the ordinary route from
to Tarudant. "But he says, "it reached comparatively
flat land, composed of Cretaceous and Tertiary rocks, then
plateau with ranges of red, probably Triassic sandstone;
ally come the barren and steep peaks of clay slate with
Silurian deposit. The pass where the descent towards
n Tarudant begins, and is 5000 feet above the sea. The
ain to Tarudant is very steep, debouching suddenly and at once dangerously
he plateau of the Anti-Atlas to the Atlas proper at its
end nothing certain is known.

he principal rivers of Morocco take their rise in the
mountains, and the headwaters of the Muluya, the
he Umm Rabi', the Dra'a, and the Ziz are all to
ed in that part of the range which lies between
and 32° 30' N. lat., and between 3° 30' and 5° W.
In almost every instance the summer current is
atively feeble, but the wide beds and often high
anks are sufficient of themselves to show the changes
ed by the rains of winter and the thaws of spring.
luya (Mulucha and Malva of Pliny, &c.) is mainly
wn as the river which the French have long wished
e the western boundary of Algeria. Its course is
ntirely unexplored. About 34° 20' N. lat. Captain
found it some 200 yards wide but quite shallow.
5 miles east of its source where it is crossed by the
Ziz it is already a powerful stream with a deep
, in the granite rock, and shortly afterwards it is
by the W. Sgimmel, a still larger affluent (Rohlfs).
lesser streams which flow into the Mediterranean it
h to mention the W. Martil or Martin (otherwise
Subu, W. Ras, W. Mgeksa), which falls into the
Tetuan, and is identified with the Tamuda of
nd Thabuda of Ptolemy. On the Atlantic seaboard
the Sebu the rivers are a number of comparatively small
, the chief of which is the very winding W. Anlkos
ses, with several tributaries. If Renou's statement
Sebu (the *Sebou navigabilis et navigabilis* of Pliny)
course not much inferior to that of the Seine be
ot of an exaggeration, it may at least be compared
Thames in length and width, though not in steadiness
gth of current. At Mehra'at al Kseir, about 70
om its mouth, it is about 10 feet deep in the month
and more than 160 feet wide, and, though its
re 21 feet high, extensive inundations occur from
time. The tide ascends as far as Al Kantara 15
bove Ma'mura, and steam barges with a small draught
r could make their way to the ford just mentioned,
ssibly even as far as Fez (Trotter). Affluents of the
re W. Mikkes and W. Al Redem (90 miles long).

The swift and muddy current of W. Beht usuall
itself in a swamp before it reaches the main stream
impetuous Umm Rabi', with a rocky bed and
rapids, is perhaps as large as the Sebú; but as th
no important cities in the country through which i
its course is not so well known. W. al-Abiad, W. al
and W. Tessaut seem to be the principal affluents.
last is separated by about 10 miles only from the
of the Tensift, the river which flows to the north
city of Morocco; and, by the W. Nefis, the Asif
(Asif is Berber for "river"), the W. Ushi, and other
tributaries, receives the waters of about 180 miles
Atlas range. The valley between the Atlas and th
Atlas is traversed by the W. Sus, whose ever flowing
is sufficient to turn the whole district into a garden
Massa or W. al Ghas (Wholgras of Davidson, Oue
Ras of Delaporter), though its headwaters drain only
two of the lesser valleys at the south west end of th
Atlas, is "about 50 yards from bank to bank at the
with a depth at high water and in the proper cha
something over a fathom." Farther south is the
of W. al Akal, long known to European geographers
name of W. Nun, and finally the famous W. D
reached, which in length of course exceeds all the r
Morocco, but, except in spring when the snows are
in the highlands, remains throughout all its lower
a dry sandy channel, hardly noticed by the traveller
surrounding desert. In the upper valleys, on the co
innumerable streams from the south side of the mas
of the Atlas, the W. Dades from the east, and th
Marghen, W. al Melah, or Warzazet from the wes
through populous and fertile valleys, and uniting t
the Dra'a cut their way southward through a gorge
Jebel Sogher, which, as the name implies, is a lowe
running parallel to the Atlas proper. For the ne
miles the noble stream holds south-south-east, dra
every step by the irrigation canals which turn thi
into a green oasis, till at last its dwindling current
westward to the sebkha (salt marsh) of Debaya.
few weeks once a year the thaw floods fill this shall
extensive basin and rush onward to the Atlantic;
summer it dries up, and, like the bed of the river fo
distance below, is covered with flourishing crops.
the south of the Atlas still farther east descend a n
of other streams, the W. Ziz (with its tributaries
Todgha and W. Gheris), the W. Ghir, the W. Kenat
which, after watering the oases of Medghara, T
(Sijilmasa), Kenatsa, &c., lose themselves in the sa
the Sahara.[1] Besides the lakes and lagoons of th
district already mentioned, there are several others, s
the Daya Sidi Ali Mohammed, which Rohlfs passe
the summit of the Atlas, but they do not form a fea
the country. The eastern frontier runs across th
Western Shatt, and south from that point lies the ex
Sebkha Tighri.

According to Du Leon, in his geological map of West Africa
the strip of country in the vicinity of Ceuta and Tetuan
Lias, modern Tertiary and Eocene rocks cover all the res
great northern promontory for some distance south of Waz
extend in an irregular belt from the neighbourhood of Fe
west to the province of Abda; between these two areas the
district of Cretaceous formations which extends to the Atlan
skirts the whole African coast from Larash as far south as Cap
700 miles south of the Dra'a; nearly all the rest of the
western slope of the country is occupied by alluvium. T
ward portion of the Atlas shows a belt of Cretaceous rocks, a
Jurassic belt, and one still broader of Red Sandstone, por
and porphyrite tuffs forming the backbone of the ridge.
Tarudant eastward runs a strip of clay slates, possibly of
iferous origin, and from Anti-Atlas in the west and Figi

MOROCCO

na were autonomous under a number of indigenous or foreign
. The chief of these principalities were that of the Idrisites
(*supra*, p. 581), the kingdom of Tahart, and that of Nakúr
first years of the 10th century the Fatimite caliphs, at the
f the powerful Berber tribe of Ketáma, overthrew the Aghlá
thus putting an end for ever to Arab rule in North Africa,
pidly extended their empire to the Atlantic. When the Fati
stablished themselves in Egypt, the Zanáta dynasty reigned as
assals in the west, and maintained themselves with varying
s till the rise of the great empire of the Almohades (*q.v.*),
elded in turn to the Almoravides (*q.v.*). The latter dynasty
tinguished by the princes of the Beni Merin, whose chief,
b. 'Abd al-Hakk, captured Morocco in 1269 A.D. The subs
t history of Morocco and Fez under the Merinids and their
ors presents little interest, being a tale of internecine war,
ed successions, fratricides, general bloodshed, and barbarism
s empty of all indications of an advance in civilization. As
s the relations of the country to Europe in particular, four periods
distinguished – (1) a period lasting down to the close of the
entury, when the Moorish potentates were still the most pow
representatives of aggressive Mohammedanism; (2) a period
which the Portuguese and Spaniards, having expelled their
rs, made vigorous reprisals and obtained possession of many
on the coast of Morocco; (3) a period in which the expansion,
rtenod by the disastrous defeat in the Battle of the Three
(1579), allowed the Moors to recover much of the ground
ad lost, and to become, by their piracies and detention of mari
al law, an object if not of terror yet of apprehension and
on; and (4) a period in which the prestige of the after
f greatness has gradually died out.

following are the more noteworthy events in the Moorish
since the beginning of the 15th century.

. Ceuta captured by the Portuguese. 1436. Disastrous expedition
Tangiers by Don Duarte; capture of Don Fernando, who
exile in 1439 (it was proposed to ransom him by cession of
but the pope objected). 1459. Capture of Arzila and Seem
Capture of Tangiers. 1510-1540. Rise of the dynasty of the
. 1577. Edmond Hogan sent by Queen Elizabeth of England
ey 'Abd al-Melek (see Report in Hakluyt). 1578. Defeat of
Sebastian (see Leared, *Visit to Court of Morocco*, appendix). I
Founding of the Company of Barbary Merchants (Earls of War
Leicester, &c.) in London; Elizabeth's second ambassador
Roberts well received. 1610. The Moors from Spain settle
at Rabát, &c., and prove troublesome. 1619. Muley Zedan
to King Charles I. requesting him to attack Sallee by sea
this time Ali Sherif of Yanbo, near Medina, is recognized as
f Táfilelt, and gradually of the rest of the empire except the
Morocco; with him commences the dynasty of the Alaouis
death his sons, Mohammed and Arshid, dispute the succes

oudesley Shovel defends British interests on the coast; with
of the English from Tangiers. 1687. Capture of Larash from
aniards. 1691. Siege of Ceuta. 1727. Thomas Betton who
on a slave in Morocco, left £13,000, the half of his fortune,
s ransom of British captives in that country. 1727-1730.
ed succession. 1757-1789. Reign of Mohammed. 1775.
s. 1780. Great famine; Agadir opened to the Dutch. 1791-
Reign of Soliman, abolition of Christian slavery in Morocco,
ssion of piracy. 1822-1859. Reign of Abd er Rahman.
with Spain on account of the decapitation of Consul Dar
wounding of a Moor. 1844. Defeat of forces sent to
l-Kader in Algiers; bombardment of Tangiers and Mogador
prince de Joinville, rout of the Moorish forces in the battle
; and peace of Tangiers. 1845. Naval demonstration at
rs and ratification of treaty; surrender to Spain of disputed
y at Ceuta. 1853. Establishment of a cordon of
military posts along the Algerian frontier. 1856. Anglo-
rcial treaty by which no duty shall exceed 10 per cent. of
ue of the wares. 1859-1873. Reign of Mohammed; Spanish
n. 1860. Decisive battle between General O'Donnell and
ors near Tetuan (March). By the treaty of Tetuan Morocco
pay 20,000,000 piastres to Spain, to surrender territory at
Cruz de Mar Pequena for a commercial establishment, and to
the Spanish missionaries to have a house at Fez like that
they had at Tangiers. Money not being obtainable to pay
demnity, the Spaniards obtained control of the customs for
of years. 1864. Decree permitting Europeans to trade in
rt of the empire. 1873. Accession of Hasan. 1880. English
y for improvement of commercial relations; conference at

Madrid to define the rights of European representatives in
to the protection afforded by them to subjects of the sultan
ber of *protégés* limited to three. 1882. Expedition to sub
Hoscin of Hah. 1883. Protest of the English Government
the slave trade in Morocco.

Lists of works in regard to Morocco will be found in Renou, *Bi*

Morocco, or Marocco (Marrakush), one of the
capitals of the sultanate (Fez and Mekne being the
two), lies in a spacious plain about 15 miles fr
northern underfalls of the Atlas, and 90 miles eas
east of Safi, at a height variously estimated at
feet (Hooker and Ball), 1110 (Beaumier), and
(Leared). Ranking during the early centuries of it
once as one of the greatest and most flourishing c
Islam, Morocco has long been in a state of grievous
and were it not for the exceptional beauty of its
the luxuriant groves and gardens by which it is
passed and interspersed, and the magnificent outlook
it enjoys towards the mountains, it would be altog
very miserable place. The wall, 25 or 30 feet hi
relieved by square towers at intervals of 360 fee
dilapidated that foot passengers, and in places even
men, can find their way in and out through the br

ON or MORON DE LA FRONTERA, a town of Spain,
rovince of Seville about 32 miles to the south
that city, occupies an irregular site upon broken
ities at a distance of a mile and a half from the
nk of the Guadiana. It is connected by rail with
on the Cadiz and Seville line. On the highest
t to the eastward are the ruins of the ancient
of considerable importance during the Moorish
and afterwards used as a palace by the counts of
In 1810 it was fortified by the French, but
n by them in the following year. The chief public
of Moron is the large parish church, which dates
16th century, but presents no noteworthy features.
e district between Moron and the Serrania de
is freely occupied by olive plantations and the
oil and other agricultural produce forms the chief
of the town. Moron used to labour throughout
r as a stalk-fed cattle. Morony, from which the white
ter is largely used in the Peninsular, is derived. The
on of the town was 14,579 in 1878.

ONI, Girolamo (c. 1520–1579), an eminent
painter of the Venetian school, was born at Albino
ween Bergamo and Lecco, and became a pupil of Bonvicino
Moretto. Lanzi records of his works very
s praises regarding him have reached us. Titian,
hom also Moroni while still very young, is said
studied (but this appears hardly probable), had
ate a high opinion of his powers, he used that
made his portrait "with a pencil dipped in actual fire."
the magnates of Bergamo came to the great Venetian
their likenesses he advised them to go to their
ntryman. In truthful and accurate portraiture
ranks near Titian himself. His pictures do not
ttain to a high ideal character; but
e full of straightforward life and individuality,
mmo unforced choice of attitude, and excellent
and arrangement of drapery. His colouring
y to a violet tint in the flesh, and the drawing
me of the hands are not first rate. As leading
of his portraits may be mentioned in the Uffizi
Florence, the Nobleman pointing to a Flame, in
"Et quel volo mi fai andar?"; in the National
Lendon, the portraits of a Tailor, a member of
roli family, Canon Ludovico de Terzi, and others,
Dulwich Gallery, his own portrait; and in Stafford
e seated half-length of the learned Ercole Tasso,
s termed "Titian's Schoolmaster," not as indicating
y real connection between the latter and Titian,
the consummate excellence of the work. Besides
ait Moroni painted, from youth to his latest
s ordinary round of sacred compositions; but in
fail to follow his master Il Moretto, and his draperies
artake more of the Lombard or Milanese style
the Venetian, has at times some of the dryness of
trecento. One of the best is the Coronation of the
in S. Maria Maggiore della Croce, Bergamo, also in the
al of Verona, St Peter and Paul, and in the Brera
n, the Assumption of the Virgin. Moroni was
upon a Last Judgement in the church of Corlago
died on 5th February 1578.

OSINI, the name of a noble Venetian family.
g to the best authorities, Cappellari and Barbaro would seem to have been two families of that
name, distinguishing themselves by the variation of their
shield. The one came from Mantua at the time of Attila's
invasion, and bore or, a less azure. The other came from
Illyria in the 7th century; they bore or, a bend azure.
However that may be, nothing authentic is known of the
Morosini till we find them settled as one family in Venice
during the 8th century. The Morosini belong to the Case
Vecchie, or twenty four families of Venetian nobility who
were descended from the tribunes of the confederate islands
before Venice became united in one centre at Rialto. The
10th century was a period of danger for the family. They
became involved in a blood feud with another noble house,
the Celsi, who were Ghibelline in politics, and relied
upon the emperor Otto for support. The Morosini, however, proved the stronger, thanks to their popularity; and
the year 931 saw them victorious through the deposition
of the doge Memo, who had favoured their enemies. The
Morosini engaged in commerce with the East, and in
the 11th century two brothers of the family, Alban and
Marco, founded a house at Aleppo with branches in
Damascus, Beyrut, and elsewhere in Syria. The wealth
and importance of the family may be gathered from the
fact that in 1379 no less than fifty nine Morosini subscribed
towards the fund for carrying on the war of Chioggia. The
house of Morosini gave four doges to Venice, and numbered
among its honours two royal marriages, two cardinals,
twenty four procurators of St. Mark, besides numerous
generals of the republic. The Morosini continued to
flourish till the opening of the last century, when the
family began to decline; it is now represented by one surviving member.

Among the more distinguished members of the house
must be mentioned. Giovanni, who in 982 founded the
monastic establishment on S. Giorgio Maggiore after the
order of St Benedict; Domenico, doge 1148-1156, in
the third year of his reign Pola and Istria, which had
rebelled, were reconquered; Marino, doge 1249-1252,
during whose reign the Inquisition, in a modified form and
under the surveillance of Venetian officers, was introduced
into Venice for the first time. In this same century (1290)
Fiamma ma Morosini, the sister of Albertino il Grande,
married Stephen, prince of Hungary. Their son Andrew
succeeded to the throne, and was directed in his government by his uncle Albertino, on whom he conferred the
dukedom of Slavonia and the county of Morlacchia. A
cousin of Tommasina, Costanza, married Ladislaus, king of
Servia. In 1382 Michele Morosini was elected doge.
He had acquired a large fortune and a reputation for
fortune-telling by buying Venetian property while the Genoese
were still in Chioggia; and much was expected of him in
the restoration of his country's finance when that war
came to an end. But he died the year of his election.
Andrea Moro-sini the historian was born in 1558. He
studied at Padua, and on coming of age embarked on
public life. He passed through the various offices of
state, till in 1618 he was a candidate for the dogeship,
but failed to secure it, and died the same year. On the
death of the official historian Paolo Paruta, in 1598,
Andrea was commissioned by the Council of Ten to continue his work, and received authority to consult the state
papers down to 1594. He wrote his history in Latin. It
covers from 1521 to 1615, and was first published in
Venice, 1623.

Andrea's other works, of which only the first has been edited, are:
(1) *L'imprese et espeditioni di Terra Santa e l'acquisto fatto dell'*
Imperio di Costantinopoli dalla Serenissima Republica di Venetia,
Venice, 1627; (2) *De rebus quæ Veneta Respublica ad Istrim oras gessit*
adversus Othonem Federici Imperatoris filium, in the Corner-Dandolo
collection of MSS.; (3) *De forma reipublicæ Venetæ*, in the National
Library, Paris; (4) *Raccolta delle Leggi del Cons. N.*, in the
Archivio Generale at the Frari, Venice; (5) *De rebus gestis ac nece*

ancisci Carmanola, in the Correr-Dudolo collection. The life of ndrea has been written by Luigi Lollin, bishop of Belluno (1623), Niccolo Crasso (1624), and by Antonio Pilazzoli (1629).

The most distinguished member of the house of Morosini as Francesco, the captain general of the republic against he Turks and conqueror of the Morea. He was born in 618. In 1666 he was in command during an unfortunate ampaign in Candia. In 1687 he conquered Patras, and opened the Morea to the Venetian arms. In the following year he was elected doge. After his return to Venice he republic suffered severely in Candia, and though now n old man Francesco took the field again in 1693, but ied the next year at Nauplia, seventy-two years of age. A ore detailed account of his exploits will be found in the rticle VENICE.

Authorities.—Barbaro, *Genealogie delle Famiglie Patrizie Venete*, S., class. vii. cod. dcccxxvii., in the Marcian Library; appellari, *Campidoglio Veneto*, MS., Civic Museum, cod. cxvi. in the ame library; Romanin, *Storia documentata di Venezia*; the ho *Nobiltà Veneta*; Cicogna, *Iscrizioni Veneziane*.

MORPETH, a municipal and parliamentary borough of Northumberland, England, is situated in a fine valley on he Wansbeck, and on the North Eastern Railway, 30 miles outh of Berwick and 16 north of Newcastle. The Wansbeck, which is crossed by a stone and two wooden bridges, inds round the town on the west, south and east, and small rivulet, the Cottingham, bounds it on the north. Morpeth is irregularly built, but possesses a number of good shops. The parish church of the Blessed Virgin, a plain building of the 14th century, restructed on Kirk Hill, short distance from the town. Among the other public buildings are the Edward VI. grammar school, reopened in 1857 after a Chancery suit lasting 150 years; the hall, erected in 1870 to supersede a building of Vanbrugh; and the county hall and former gaol, baronial style, built in 1814. Nothing remains of castle except the gate-way. Morpeth had at one time the largest cattle markets in England. The industries of the town include tanning, brewing, malting, iron and brass founding, and the manufacture of flannels, agricultural implements, and brick and tiles. The population of the municipal borough (251 acres) in 1871 was 7517, in 1881 it was 7556. The population of the parliamentary borough (17,075 acres) in the same years was 30,[illegible] 33,159.

Morpeth (*Morthwaite*, &c., the path over the moor) had [illegible] before the Norman Conquest, when it was [illegible] With[illegible] Merley. From the De Merleys it [illegible] and came to the Howards, earls of Carlisle. [illegible] Conquest it obtained the privilege of [illegible] and were granted to Edward VI. by [illegible]. Municipal Act of 1835 the government was placed in [illegible] boroughs, but there is a local board of health [illegible] corporation have exercised over an area slightly larger [illegible] of the municipal borough. From 1868 the borough [illegible] members to parliament, but the 7252 county electors [illegible] returned another to the new House of Commons.

MORPHEUS (a personification, apparently [illegible] by Ovid (*Metam.*, xi. 633), of the power that [illegible] shapes before the eyes of a dreamer. The name [illegible] (*morphé*) expresses the American Ovid translates it [illegible] (*moulder of images*). Morpheus is naturally [illegible] the son of Sleep (Somnus).

MORPHIA. See OPIUM.

MORPHOLOGY

THE term Morphology (*morphé, forma*), introduced by Goethe to denote the study of the unity of type in organic form (for which the Linnean term METAMORPHOSIS (*q.v.*) had formerly been employed), now usually covers the entire science of organic form, and will be employed in this more comprehensive sense in the present article.

§ 1. *Historical Outline.*—If we disregard such vague likenesses as those expressed in the popular classification of plants by size into herbs, shrubs, and trees, or of terrestrial animals by habit into beasts and creeping things, the history of morphology commences with Aristotle. Founder of comparative anatomy and taxonomy, he established eight great divisions (to which are appended certain minor groups) *Viviparous Quadrupeds*, *Birds*, *Oviparous Quadrupeds and Apodes*, *Fishes*, *Mollusks*, *Malacostraca*, *Entoma*, and *Ostracodermata*, distinguishing the first four groups as *Enaima* ("with blood") from the remaining four as *Anaima* ("blood less"). In these two divisions we recognize the Vertebrata and Invertebrata of Lamarck, while the eight groups are identical with the Mammals, Birds, Reptiles, Fishes, the Cephalopods, Crustaceans, other Articulates, and Testaceans of recent zoology. Far, too, from committing the mistake often attributed to him of reckoning Bats as Birds, or Cetaceans as Fishes, he discriminated the true affinities of both, and erected the latter into a special γένος beside the Viviparous Quadrupeds, far more on account of their absence of limbs than of their aquatic habit. Not only is his method inductive, and, as in modern systems, his groups natural, *i.e.*, founded on the aggregate of known characters, but he foreshadows such generalizations as those of the correlation of organs, and of the progress of development from a general to a special form, long afterwards established by Cuvier and Von Baer respectively. In the correspondence he suggests between the scales of Fishes and the feathers of Birds that hinted at between the furs of Fishes and the hairs of Quadrupeds, the idea of homology too rarely accepted from the compilation of his disciple Nicolaus of Damascus, who regarded Aristotle as imperfectly developed brute, almost to have anticipated the idea of the metamorphosis of plants. In short, we find a knowledge of facts and a comparative freedom from the errors by physiological evidence of which his successors, as Theophrastus and Pliny generally more classified habit, show little trace and which the modern has slowly regained. Little indeed can be recorded in the 13th century, when the reappearance of Aristotle gave a new impulse to the study of organic nature; the works of this period that of Albertus Magnus the most important, but they are all no more than revivals of Aristotle, marking the reappearance of method and the reawakening of interest in and sympathy with nature. Meanwhile leech and apothecary, alchemist and witch, were accumulating considerable knowledge of plants, which, after the invention of printing, were collected and extended in the descriptive and well illustrated folios of Gesner and his successors, Fuchsius and others, as well as by the establishment of botanic gardens and chairs of botany in the academies, while, as Sachs remarks, the large additions to the naive empiricism of the German fathers of botany came their Italian contemporary Caesalpinus, as the thinker of the vegetable world. Many systematic efforts, the Germans vaguely according natural affinities in mere similarities of habit, the Italians with no inconsiderable success striving towards more intellectual basis of classification. Monographs on groups of plants and animals frequently appeared, those of Belon on Birds and Rondelet on Fishes being among the earliest. In the former of these (1555) we find a comparison

ns of Bird and Man in the same posture and as
as possible bone for bone, an idea which, despite
temporaneous renaissance of human anatomy ini
y Vesalius, disappeared for centuries, unappreciated
the surgeon Ambroise Paré. Palissy, like Leonardo
and, discerned the true nature of fossils; and such
ot morphological insight continued to appear from
time during the 17th century. Thus, Joachim
cognized "the distinction between root and stem,
rence between leaves and tobacconist branches, the
on from the ordinary leaves to the *folia florea*," and
anticipated the generalizations of modern embryo
his researches on development and his theory of
sis.

neyclopaedic period of which Gesner is the highest
ntative was continued by Aldrovandi, Jonston,
rs in the 17th century, but, aided powerfully by
roman movement, then profoundly influencing all
e minds, it developed rapidly into one of genuinely
ne aim. At this stage of progress by far the most
nt part was taken by John Ray, whose classificatory
both among plants and animals were crowned with
ne success. He first definitely expelled the fabulous
s and prodigies of which the encyclopaedists had
dly handed on the tradition from mediaeval times,
o his predecessor Morison, classifying in a truly
spirit by anatomical characters, he succeeded,
arly among plants in attaining many natural
tor which his very terms sometimes survive, *e.g.*,
edons and Monocotyledons, Umbelliferae and Le
The true precursor of Linnaeus, he introduced
of *species* in natural history, afterwards to become
and reformed the practice of definition and termino-
Of the many works which followed up Ray's
ne and monographic labours, though often, like
f Tournefort and Rivinus, Reaumur and Klein of
portance, none can be even named until we come
of his great successor Linnaeus, whose extraordinary
logical method and unparalleled lucidity of thought
ression enabled him to reform and reorganize the
abours of his predecessors into a compact and
"systema naturae." The very genius of order,
olished modern taxonomy (see BIOLOGY), not only
ntroduction of the binomial nomenclature. At the
ion of descriptive terminology and method, but
subordination of the species henceforth clearly
under the successive higher categories of genus,
nd class, so finally reconciling the analytic and
ic tendencies of his predecessors. Although the
ation of plants by the number of their essential
which vastly advanced not only the cultivation of
but the knowledge of the flora of the globe, and
h he is popularly remembered) is highly artificial,
be remembered that this artificiality is after all
ion of degree, and that he not only distinctly
ed its provisional character but collected and ex
these fragments of the natural system with which
soon afterwards commenced to build. His classi-
of animals, too, was largely natural, and, though
whole he not accurately lent his authority to main-
hat disastrous philosophic and scientific aberration
d from the alchemists through the later encyclopaedist
er's school the notion of three kingdoms of nature
lea that at one time divorced the fundamental unity
als and vegetables and united them in opposition to
living world as *Organisms*. At the same time he
l far more a scholastic naturalist than a modern in-
or, and his works represent little more than the full
ion of the ancient era, and in the hands of fanatical
s served often to retard the commencement of the
modern one. So, too, his excessive systematic and descri
precision, united as it was with comparative inatte
to other than superficial characters, established a tend
even yet not extinct, to rest contented with mere nu
and nomenclature instead of aiming at complete mo
logical knowledge.

While the artificial system was at the zenith of its
and usefulness, Bernard de Jussieu was arranging
garden on the lines afforded by the fragmentary na
system of Linnaeus. His ideas were elaborated by
nephew and successor Antoine de Jussieu, who for
first time published diagnoses of the natural order
giving the system its modern character. Its subseq
elaboration and definite establishment are due main
the labours of Pyrame de Candolle and Robert Br
The former concentrated his own long life and that o
son upon a new "systema naturae," the colossal *Prodr*
systematis naturalis (20 vols., 1818-1873), in which 8
species were described and arranged. Meanwhile the
trative genius of Brown enabled him to unravel such s
tural complexities as those of Conifers and Cycads, Or
and Proteaceae, thus demonstrating the possibility of
taining the systematic position of even the most h
modified floral types. Both Candolle and Brown were
no mere systematists, but genuine morphologists of
modern school. The former, as we shall afterwards
established the theory of floral symmetry on groun
pure comparative anatomy, and distinguished with gr
success than hitherto between fundamental unity of s
tural type and mere superficial similarity of physiolo
adaptation. The latter (Humboldt's "facile pri
botanicorum"), using the same ideas with even keen
sight, made many memorable anatomical researches,
as those on the structure of the ovule and the seed
indeed by his demonstration of the affinities of the
nosperms almost anticipated the discoveries of Hofme
who stands pre-eminent among his modern successo
account of his elucidation of the secret of phanerog
reproduction.

The labours of Bernard and Antoine de Jussieu init
to a vast parallel advance in zoology, the joint m

on a new basis, henceforth to be no longer a matt
superficial description and nomenclature but a com
expression of structural resemblances and differences.
even than Linnaeus he is the founder of a great s
whose names and labours are imperishable. In Ger
Bojanus, Meckel, Von Siebold, and the illustrious Joh
Müller, with his many living pupils, have carried o
work; in France, too, a succession of brilliant anato
such as De Quatrefages, Milne-Edwards, and La
Duthiers, are his intellectual heirs; and in England h
been admirably represented by Owen.

The histological movement inaugurated by Bichat will be subsequently discussed; the rise of embryology, however, may be briefly noted, especially since it supplied the most obvious deficiency of the Cuvierian school. Here the principal figure is Von Baer, who established independently the four types of Cuvier on developmental grounds, so for the first time applying embryology as the touchstone of anatomical classifications, besides establishing his famous law of differentiation from a general toward a special form.

It is now necessary to return to Linnaeus, whose more speculative writings contain, though encumbered by fantastic hypotheses, the idea of floral metamorphosis ("Principium florum et foliorum idem est," &c.) About the same time, and quite independently, C. F. Wolff, the embryologist, stated the same theory with greater clearness, for the first time distinctly reducing the plant to an axis bearing appendages—the vegetative leaves which become metamorphosed into bud scales or floral parts through diminution of vegetative force. Thirty years later the same view was again independently developed by Goethe in his now well-known pamphlet (*Versuch die Metamorphose der Pflanzen zu erklären*, Gotha, 1790). In this brilliant essay the doctrine of the fundamental unity of floral and foliar parts is clearly enunciated, and supported by arguments from anatomy, development, and teratology. All the organs of a plant are thus modifications of one fundamental organ the leaf and all plants are in like manner to be viewed as modifications of a common type the *Urpflanze*. The controversy as to the merits and importance of this essay, and of Goethe's morphological work in general, can scarcely be entered upon here. That Goethe discerned and proclaimed, and that more clearly than any of his predecessors or contemporaries, the fundamental idea of all morphology the unity which underlies the numerous varieties of organic form and that he systematically applied this idea to the interpretation of the most important, most complex, and most varied animal and vegetable structures, is unquestionable. The difficulties arise when we seek to estimate the importance of his works in the chain of progress, and when we inquire whether, as some historians hold, his "Urpflanze" was a mere ideal archetype, bringing forth as its fruit the innumerable metaphysical abstractions of the Naturphilosophie, and leading his countrymen, to their fall, into all the extravagances of that system; or whether, as Haeckel maintains, it represented a concrete ancestral form, so anticipating the view of modern evolutionists. That to him Schelling was largely indebted for the foundation upon which he erected his philosophic edifice, as also that Goethe largely shared the same ideas, is unquestionable; but it must be remembered that he lived and made progress for forty years after the publication of this essay, that he was familiar with the whole scientific movement, and warmly sympathized with the evolutionary views of Lamarck and Geoffroy St-Hilaire; it is not therefore to be wondered at that his writings should furnish evidence in favour of each and every interpretation of them. His other morphological labours must not be forgotten. Independently of Vicq d'Azyr, he discovered the human premaxillary bone; independently of Oken, he proposed the vertebral theory of the skull; and before Savigny, he discerned that the jaws of insects were the limbs of the head. In 1813 A. P. de Candolle published his *Théorie Élémentaire de la Botanique*, which he developed into the classic *Organographie Végétale* (1827). Although at first unacquainted with Goethe's essay, and not clearly discerning the homology of leaves and floral parts, he established his theory of symmetry, reducing all flowers to "symmetrical" groupings of appendages on an axis and accounting for their various forms by cohesion and adhesion, by arrested or excessive development. The next great advance was the investigation by Schimper and Braun of *phyllotaxis*, or the ascending spiral arrangement of foliar and floral organs, thus further demonstrating their essential unity.

The term *morphology* was first introduced by Goethe in 1817, in a subsequent essay (*Zur Naturwissenschaft überhaupt, besonders zur Morphologie*). It did not come into use in botany until its popularization by Auguste St Hilaire in his admirable *Morphologie Végétale* (1840), and in zoology until later, although De Blainville, who also first employed the term *type*, had treated the different forms of animals under "morphologie." Though the naturphilosophie of Schelling and its countless modifications by his followers, its mystic theories of "polarization" and the like, its apparatus of assumption and abstract hypothesis and metaphor, cannot here be discussed, its undoubted services must not be forgotten, since it more than anything else stimulated innumerable reflective minds to the serious study of natural science, but, by its incessant proclamation of the unity of nature and the free use of Platonic archetypal types, gave a most powerful impulse to the study of comparative anatomy, and nobly vindicated the claims of philosophic synthesis over those of merely analytic empiricism. Among its many adherents, some are of more distinctly theological type, others metaphysical, others mystical and poetic, others, again more especially scientific, but the most typical and picturesque figure is Lorenz Oken, who epitomizes alike the best and the worst features of the school, and an age whose innumerable pseudo morphological dreams therein occasionally occurred suggestions of the greatest fruitfulness, notably, for instance, the modern statement of the vertebral theory of the skull.

Although Lamarck shared in this movement, his great work (the *Philosophie Zoologique*, 1809), being physiological rather than morphological, scarcely claims discussion here. By far the most distinguished anatomical adherent of the transcendental school is Geoffroy St Hilaire, who, comparatively free from the extravagance of Oken, united a depth of morphological insight scarcely inferior to that of Goethe with greater knowledge of facts, a much wider influence and reputation in the scientific world, and, although affected to some extent by the poetic and metaphysical spirit of the age, necessarily a more and had enormously greater influence on the progress of science than either. He started from the same studies of anatomical detail as Cuvier, but profoundly influenced by the idea of unity of plan and by the evolutionary doctrines of Lamarck, he rapidly diverged into new lines, and reached that idea of serial homology of which we so frequently noted the independent origin. His great work, the *Philosophie Anatomique* (1818–1822), contains the principal doctrines. These are (1) the theory of the conditions, identical in spirit with that of Cuvier; (2) the theory of analogues, according to which the parts, differing only in form and in degree of development, should occur in all animals; (3) the "principe des connexions," by which similar parts occur everywhere in the same relative positions; and (4) the "principe du balancement des organes," upon which he founded the study of teratology, and according to which the high development of one organ is allied to diminution of another. The adventurous morphological theory is here obvious; unfortunately, however, the principle pursuit often deceptive homologies, and wandered into the transcendentalism of the Naturphilosophie, and seems utterly to have failed to appreciate the type theory of Cuvier or the discoveries of Von Baer. He earnestly defended Buffon's and Bonnet's earlier ideas of unity of plan in nature; and the controversy reached its climax in 1830, when he maintained the unity of structure in Cephalopods and Vertebrates against Cuvier before the Academy of Sciences. On the point at issue he was of course utterly defeated, the type theo-

forward fully accepted and the Naturphilosophie
d its deathblow, while a "second empiric period"
t anatomical and embryological research seemed
r to replace it. Such was the popular view; only
like the aged Goethe, whose last literary effort was
tely critique of the controversy, discerned that the
wer interpretation was the deeper and essential

Haeckel, Balfour and Parker, Dyer, Lechler, or Asa
and (provided with the needful bibliographical equ
afforded by the various "*Jahresberichte*" and the
English publications) must indeed also plunge in
current literature of the science. And there too m
sought the innumerable attempts at taxonomic sy
which such organological processes constantly org
(see ANIMAL KINGDOM, Biology, vol. iii. p. 690;
VEGETABLE KINGDOM). Embryological generali
such as Haeckel's "gastræa theory," Lankester's riva
nula theory, or the foremost "coelome theory" o
wig, have been recently thoroughly criticized in B
Embryology. The present article will be confine
brief discussion of a few main problems, commencin
the cell theory and the problem of organic indivi
—these being selected partly because of their specu
trativeness and intrinsic importance, partly becau
have somewhat less recently been summarized.

§ 3. *Histology of Tissues.*—Although the application
simple microscope to the minute structure of plants and
had been in progress since the end of the 17th century, th
modern histology really dates from the *Anatomie Générale*
of Bichat, which analyses the organism into a series o
tissues with definite structural characters. This new
together with the improvement of optical appliances, led
to "fibres" and "globules," "lamin
described, and even "cells" by Mirbel
and in 1835 Johann Müller pointed out the existence
homologous tissues of plants in the vertebrate notochord. T
lar and nucleated structure of epidermis and other tissues
demonstrated, while Robert Brown discovered the nucleu
vegetable cell. In 1838 Schleiden referred all vegetable ti
the cellular type, and traced back the plant embryo to
nucleated cell, while in 1839 Schwann boldly extended t
ception of plant structure and development to the anima
and so fully constituted the "cell theory."

Schwann's cells were essentially nucleated vesicles wi
contents which originated in an intracellular substance;
view was soon abandoned. Dujardin had discovered that th
of Foraminifera were composed of a viscous granular co
ode, and Von Mohl described independently in simila
the contents of the vegetable cell as *protoplasm*. This wa
ted by Max Schultze as Dujardin's sarcode, the newer n
viving; and this living matter, and not the membrane, be
to be the essential constituent of the cell, since which his
definition of the cell as a unit mass of nucleated protopl
been generally accepted. Prevost and Dumas had not
segmentation of the ovum into masses as early as 1824, a
were naturally identified as cells immediately after the pu
of Schwann's work. In 1846 Kölliker showed that all tiss
from these segmentation masses, and that the multiplic
animal and vegetable cells takes place by a continuation
same process, that of transverse division already observe
Protozoa.

These points gained, the attention of histologists was wi
for a considerable time from the scrutiny of the minute s
of the cell itself to be concentrated on the modes of origin
unit masses, and their subsequent differentiation and agg
into tissues and organs. The minute structure and histog

[1] For bibliography see Carus, *Geschichte der Zoologie*; Sachs, *Geschichte d. Botanik*; Cuvier, *Hist. d. Sci.*; Is. G. St-Hilaire, *Hist. Gén.*; Masters in *Med.-Chir. Rev.*, 1858, &c.; also articles LINNÆUS, OKEN, &c.

as well as of at least the higher animals, have been studied
much and ever-increasing accuracy of detail. (See ANA-
HISTOLOGY, EMBRYOLOGY.) Both vegetable and animal
have been simply classified both according to their adult
and according to the embryonic layers from which they
rively arise. This scrutiny of plant and animal structure
d above the special generalizations of the botanist and the
st has afforded much result to general histology. The
vement of technical methods has of late years largely aided
ogress of discovery. A return from the study of the cell-
ate to that of the cell has commenced, and the question of
ucture may be said to be again paramount in histology. The
s of transverse division has of late been much elucidated,
although its complex details cannot here be entered upon,
ult has been to establish a minute and thorough correspond
cases so widely dissimilar as pollen-grain from a flower-bud,
derm of a tadpole, or the cells of a tumour—a result which
ly enhances the morphological completeness of the cell.
Minor modes of cell multiplication also are not without
morphological interest. Gemmation, familiar in the yeast
ocytes in other low and simple organisms, and most probably
tified with the formation of polar vesicles in ova, is a modifi
n of transverse division. Schleiden had supposed all new
originate within pre-existing cells, and the process known
cell-formation, may readily be observed in various plant
imal tissues. The protoplasm-groups at first found within cells,
w cells being in fact formed much as Schwann had imagined
upposed; but these modes have repeatedly been chosen
om segmentation of the original nucleus, and thus this pro-
o seems a mere modification of the general one of transver-

ing. Conjugation, too, that coalescence of two contiguous cells
may be observed in many Algæ, Fungi, and Protozoa, and
sidered as the undifferentiated form of that fertilization which
in higher animals and plants, the two apparently similar
having become respectively differentiated into ovum and
atozoon, or into egg-cell and antherozoid. An indefinite
r of amœboid cells sometimes flow together more rarely
—a phenomenon regarded by some as multiple conjugation,
haps more probably as an almost mechanical coalescence of
sted cells, from which conjugation proper and finally fertili-
may indeed have originated. The amœboid cells of higher
ls similarly unite when drawn, and this formation of *plas-*
, as these are termed, seems to be a deep-seated property of
nœboid cell. Similarly, too, the process of reproductive conju-
occurs in many of the lowest plants and animals, notably
occus and Amœba, where the protoplasm passes from a rest-
d encysted to a naked and mobile stage, has many analogies
ly among the Protista but even in the tissues of higher
ls, while the phases which the lowest organisms more or less
t—the encysted, the ciliated, the amœboid, and the flagellate—
may be regarded as the fundamental forms of a "life-cycle,"
epresented indeed only in such extremely low organisms as
nyxa and Myxomycetes, yet nowhere completely suppressed
ery highest plants and animals may thus be considered as
gates of more or less differentiated and variously arranged
ed, amœboid, and ciliated cells, while their development
bsequent changes, their variations normal and pathological,
ity exhibit phases more or less distinct of the ancestral life-

examination of the precise modes of cell division, particularly
hands of botanists (see BOTANY, and SUMMARY OF SACHS'S
Lehrbuch der Botanik, 1874, are also constantly
ing the most interesting light upon the structure of the adult
sm. Thus then, in our own dynasty in those of Richard Owen,
nn, the labours of the histologist, when inspired by higher
han that of the mere multiplication of descriptive detail, not
e one morphological importance, and result in the demonstra-
f a unity of organic structure deeper even than any which was
Linnæus or Cuvier, Goethe or Geoffroy.

Individuality.—Probably no subject in the whole range of
y has been more extensively discussed than that of the nature
ganic individuality. The history of the controversy is
st, since besides leading up to solid results it serves, perhaps
than any other case, to illustrate the slow emergence of the
l sciences from the influence of scholastic thought. Starting
he obvious unity and indivisibleness of Man and other higher
ls, and adopting some definition such as that of Mirbel
tionally unmetaphysical, however), "Tout être organisé,
et dans ses parties distinct et séparé des autres êtres qui
dit," it was attempted times without number to discover the
conception elsewhere in nature, or rather to impose it upon
er beings, plants and animals alike. The results of different
ers were of course utterly discrepant. It seemed easy and
l to identify a tree or herb corresponding to the individual
l, yet difficulties at once arose. Many apparently distinct
may arise from a common root, or a single plant may be
posed into branches, twigs, shoots, buds, or even leaves, all

often capable of separate existence. These, again, are de-
able into tissues and cells, the cells into nucleus, &c., and ult
into protoplasmic molecules, these finally into atoms, the
thus passing outside organic nature altogether and meeting
dispute as to the ultimate divisibility of matter. In s
Haeckel remarks, scarcely any part of the plant can be
which has not been taken by some one for the individua
necessary, therefore, briefly to notice some of the princip
on the subject, and these may conveniently be taken in chr
order.

While Cuvier practically agreed with Mirbel in attem
regard separate plants as individuals, the widest interpret
the individual is that of Gallesio (1816), who proposed to
a an individual the entire product of a single seed, alike
the developed monocarpic plant extended continuously
Banyan, or multiplied asexually by natural or artificial me
the Weeping-willow or the Canadian Pondweed, of each of
on this view there is only a single individual in Britain,
dicotyledon.

At once the oldest and most frequently maintained view
which regards the bud or shoot consisting of a single a
appendages as the plant individual, of which the tree repr
colony like a branched hydroid Polyp. This conception
attributed to Aristotle, but apparently without foundation,
distinctly in the writings of Hippocrates and Theophrastus
later times. The bud-crown on the tree-like plant in the g
Theophrastus of Lamarck—"Semina totidem herbæ, totidem
and in the view of C. F. Wolff and Humboldt concerning
Erasmus Darwin appealed to by an appeal to the facts of
and development. The most influential advocate of the bud
during the first half of the present century was, however, H
Thomas, who, although starting much in accord with the
unique definiteness," supported by the theory of extensive
largely incorrect observation on the structure and growth
him the tree is a colony of *gemmæ*, or buds, each with its
and root. Following out the
central wood of Alex. Braun

cult, because, unlike the
ntial character of the
ie to accept the bud or
ternal
ecially led Goethe, Ok
ucleus, while Johannes
Link stopped short at the cell, adopted the same view on various
logical grounds. Candolle elaborated a theory inter
tween tissues and that of Du Petit Thouars, according
the plant or bud-type of individual, each consisting of a
its adjacent internode or stem, which were regarded as the
and this was supported by Edward Forbes and other, w
naturally conveyed a view like that of the leaf as a mere outg
pan out of the term segment was proposed by Hochstetter
Though many attempts at identifying various grades,
the tissue-cells to bundles of the coexistent individuals
pre-eminent, those connected with the cell theory are
important. Schwann declared an account of the cell and
the plant as a cell-community, in which the separate elem
like the bees of a swarm, a view virtually concurred
entific reputes by Schleiden, Virchow, and other founde
cell theory. Yet, although the structure and function of t
co-ordinate, and evidently subordinate, it is impossible t
the fact that, even in the very lowest organisms, these are
not fused and did not at first enter into later aggregates, and form
bricks of a building, and hence the later theories
or attempts to find the individual in the nucleu
proto
ing
the theory of the plastid-individuality. The conce
modern Botany is well traced by Frech upwards t
e
and the older De Candolle to its
on in Alp
Candolle and Schleiden, both of whom take the cell, the s
the multicellular plant as forming three successive and subo
categories. Nägeli too recognizes not only the necessity of e
ing such a series (cell, organ, bud, body-axis, multi-axi
but the distinction between morphological and physiolo
dividualities afterwards commented on by Haeckel.

Passing over the difficulties which arise even among the
(see FORAMINIFERA), we find that a similar controver
chronicled in Haeckel's *Kalkschwämme*) has raged over
dividuality of Sponges. While the older observers were c
regard each sponge mass as an individual, a view in which La

r monographers, substantially concurred, the application of oscope led to the view suggested by James Clark, and still supported by Saville Kent, that the Sponge is a city of l or infusorian individuals. Carter looked upon the separate ons alone as the true individuals, while Schmidt, defining vidual by the possession of a single exhalent aperture, div s Sponges into solitary and social. Later, however, he *a compounda*.

e higher animals the problem, though perhaps really ev ntly less prominent. As Haeckel points out, the earth ns and even the comparatively late essay of Johann ke an almost purely psychological rather than a biological view, and the morphological aspect of the inquiry only ward when the study of much lower forms, such as Ceelen se Physophoridæ or Siphonophores (see Hydrozoa), d the difficulties with which botanists had so long been

With the rapid progress of embryology, too, arose new s; and in 1842 Steenstrup introduced the conception of an tion of generations" as a mode of organo-distinct individuals, thods, for him fundamentally similar, the sexual from nu- d females and the asexual from unimpregnated "nurses," dopted by Edward Forbes and many other naturalists, but ticized by Carpenter and Huxley. In Leuckart's remark y on polymorphism (1851) the Siphonophora were analysed ne, and their varied organs shown to be morphologically, at, while the alternate generations of Steenstrup were to a case of polymorphism in development. Leuckart arly distinguished individuals of different orders, as well n morphological and physiological individuals.

Huxley proposed the view which he still substantially s (see Biology). Starting from such an undoubted homo hat of the egg-producing process of Hydra with a free- g Medusoid, he points out that the title of individual, if o the latter, must logically be due to the former also, and s confusion between organism and individual by defining the al animal, as Galton had done the plant, as the entire of an impregnate fovum, the swarm of Aphides or bee which in this way must belong to a single individual being *Annals*.

ns's *System of Animal Morphol* 1858 another theory ounded, but the problem then seems to have fallen into until 1865, when it formed the subject of a prolonged and ssion in the *Principles of Biology*. Adopting the cell as an aggregate of the lower order, itself formed of physi- nits as the morphological unit, Spencer points out that y either exist independently, or gradually e gate of the second order, like the lower Alg of which nduality may be more or less pronounced. The union of ondary aggregates or compound units into individual of a r order is then traced through such intermediate forms as nited by the higher seaweeds or the Liverworts from that which the axes and appendages of Monocotyledons and don are ingeniously derived. The shoot of a flowering thus an aggregate of the third order, it branches into an of the fourth or higher order, and finally as a tree s a degree of composition too complex to be any longer Proceeding to animals, the same method is applied lozoa are aggregates of the first order. The e, like plant ttractions, of which Radiolaria, Foraminifera, and are taken as examples, to such definite compound whole , and such secondary aggregates multiply by gemmation ir most aggregate of the third order, which may exhibit es of integration up to that of the Siphonophora, where ndividualities of the Polyps are almost lost in that of the e form. The whole series of articulated animals are next ed as aggregates of the third order h as the Annelid are the less developed forms, the ol- bretels into segmented and individualized Molluscs to the ites of the ge appe morphological the *Generelle* of Haeckel[1] here pure morphology is distinguished ubsequent the first purely structural, *tectology*, which the organism considered as a genus individuals of different the second experimental, etiology, *promorphology*. To , detailed in the *Generelle* of organic individuality, a large of the work is devoted. Drawing on the theory of absolute dity and metaphysical fragment, and starting from the Schleiden, De Candolle and Nägeli of several successive es of relative individual he shows how more clearly than ne the physiological individual or *œcie*, characterized by ence and independence of function from the morphological ual or *cenobium*, characterized similarly by definiteness of of the latter he establishes seven categories, as follows

Plastide (cytod, metacyte, or elementary organisms).

Anter (cell-tissue or cell fusion-mass) or homoplastic or- ans (tissues), or heteroplastic organ. Organ-system, organ- (apparatus).

3. *Antimeres* (opposite or symmetrical or homotypic part rays of radiate animals, "halves of bilaterally symm animals).
4. *Metameres* (successive or homodynamous parts), *e.g.* segments of Phanerogams, segments or zooïtes of A or Vertebrates.
5. *Persona*, shoots or buds of plants, polyps of Coelen &c., "individuals" in the narrowest sense among the
6. *Cœnœcia* (stocks or colonies), *e.g.*, trees, chains of Salpæ stocks, &c.

In his subsequent monograph on calcareous Sponges, an final paper he somewhat modifies these categories by subst one category of extreme comprehensiveness, that of the *ido* place of the three separate orders of organs, antimeres, an meres. The idorgan (of course clearly distinguished fr physiological organism or biorganes) finally defined as a morph unit consisting of two or more plastids, which does not pos positive character of the person or stock. These are distin into *homoplasts* or *homœomera* and *alloplasts* or *allœomer* former meeting, as subdivisions, plastid-aggregates and fusions, the latter idiomeres, antimeres, and metameres. The definition of the tetrantimere, as denoting at once each ray of a radiate, or the right and left halves of a bilateral metrical animal, is corrected by terming each ray a *paramere* symmetrical halve the antimeres. Thus an ordinary Medu four parameres and eight antimeres; a Starfish five and ten. T ception of the persona is largely modified, not only by with the comparison of the animal with the vegetable shoot and b ting the antimere and metamere as necessary constituents, taking the central embryonic form of all the Metazoa the g l and its assumed ancestral representative, the gast the simplest and oldest form of per- sona. The different morphological stages to which it may attain are classified into three series. (1) Monaxonial[2] inarticulate persons, *i.e.*, un axial and unsegmented without ant meres or metameres, as in Sponges, e lowest Hydroids, (2) Stauraxonial inarticulate persons with antimeres, but without metameres, *e.g.*, Coral, Mollusc, Turbellarian, Trematode, Hy drozoon, (3) Stauraxonial articulate per sons with antimeres and metameres, *e.g.*, Annelids, Arthropods, Vertebrates. The colonies of Protozoa are merely idor gans. True cœnœcia, composed of united persons, occur only among Sponges, Hydroids, Siphonophores, Corals, Bry ozoa, Tunicates, and Echinoderms, of which the apparent parameres are regarded as highly centrali sorts of a radially budded worm colony; and these can be c according to the morphological rank of their constituent p They usually arise by gemmation from a single persona, yet in and Corals occasionally by fusion of several originally per ons or cœnœcia. The theory of successive subordinate individuality being thus not only derived from historical of previous theories but brought into conformity with th facts of development and descent, various groups of or being referred to their several categories, the renaming of tectology, that of the relation of the morphological to the logical individuality, is briefly discussed. Of the latter, th genera are proposed—(1) the "actual bion or complete phys individual," this being the completely developed organic for has reached the highest grade of morphological individualit to it as a representative of, *e.g.*, its species; (2) the "virtu or potential physiological individual," including any incom developed form of the former from vum upwards; the "partial bion or apparent physiological individual," su ments of the actual or virtual bion as may possess tempora pendence without reproducing the species, this latter having, however, inferior importance.[3]

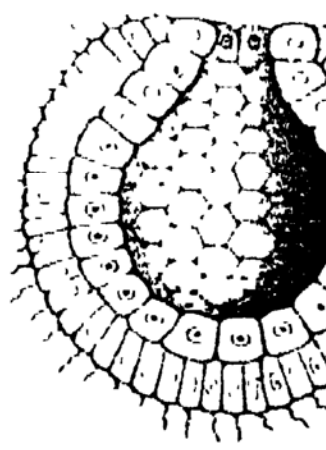

FIG. 1.—Gastrula in op tion, showing primitiv and digestive cavity pore and arch enteron outer and inner layers, and endoderm. (After

Haeckel's theory, moved in its earlier form, has been ado ray Lankester and other morphologists, also in its later form b who, however, rejects the category of idorgan on the groun general morphological principle that every natural bod carries on any chemical changes with its environment differentiated into more or less concentric layers, but the especially as far as animals are concerned, is again recei cussed in a large work by Perrier. Starting from the cell or he terms a permanent colony a *microde*, and these may isolated like Syzygia or Rotifers, or may multiply by gemm

[1] For explanation of these terms see s.v. Promorphology, p. 814.

[2] For criticism of this theory on the ground of its making physiol pend on morphological individuality, see Fisch, *Untersuchung und Verschiedenen Ansichten über das pflanzliche Individuum*, p. 11.

higher aggregates which he terms *zoöds*. Such zoöds may be
lar, radiate, or linear aggregates, of which the two to
especially are termed *demes*. The organ Haeckel's idiorgan
luded, since tissues and organs result from division of labour
e anatomical elements of the meride, and so have only a
dary individuality, "carefully to be distinguished from the
duality of those parts whose direct grouping has formed the
sm, and which live still, or have lived, isolated from one
er." Perrier further points out that undifferentiated colonies
ssile, as Sponges and Corals, while a free state of existence is
ated with the concentration and integration of the colony into
ividual of a higher order.

far the various theories of the subject, detailed criticism is
sible, but some synthesis and reconciliation must be attempted
ng from the cell as the morphological unit, we find these
g homogeneous aggregates in some Protozoa and in the early
opment of the ovum. But integration into a whole, not
y aggregation into a mass, is essential to the idea of individu-
the earliest secondary unit, therefore, is the gastrula or
e. This stage is permanently represented by an unbranched
a or Sponge or by a Planarian. These secondary units may,
ver, form aggregates either irregular as in most Sponges, ir-
tely branched as in the Hydroids and Actinozoa, or linear as in
Planarians as Catenula. Such aggregations, colonies, or demes,
ing aggregated, do not fully reach individuality of the third
This is attained, however, for the branched series by such
as Siphonophore among Hydrozoa, or Rose
g Actinozoa; for linear aggregates again by the higher Worms,
till more fully by Arthropods and Vertebrates. Aggregates
et higher order may occur, though rarely. A longitudinally
ng Nais or laterally branched Syllis are obviously aggregates
se tertiary units, which, on Haeckel's view, become integrated
e Echinoderm, which would thus reach a complete individ
y of the fourth order. A chain of Salpæ or a colony of Pyro-
exhibits an approximation to the same rank, which is more
y obtained by a radiate group of Botryllus around their central
, while the entire colony of such an Ascidian would represent
dividual of the fifth order in its incipient and unintegrated
—these and the preceding intermediate forms being, of course,
y intelligible, and indeed as Spencer has shown, inevitable
e theory of evolution.

exclusion of tissues and organs from rank in this series is
seen to necessarily follow. Ectoderm and endoderm cannot
alone; they and the organs into which they differentiate
merely, as Jäger expresses it, from that concentric lamination,
th Perrier, from that polymorphism of the members of the
y, which is associated with organic and social existence. The
of the antimere is omitted, as being essentially a promorpho
l conception for a Medusoid or a Star-fish, though of widely
et order of individuality, are equally so divisible; that of
netamere a convenient to denote the secondary units of a
tertiary individual; the term persona, however, seems unfit
to survive, not only on account of its inseparable psycholo-
l connotations, but because it has been somewhat vaguely
d alike to aggregates of the second and third order, and the
colony, corm, or deme may indifferently be applied to those
gates of primary, secondary, tertiary, or quaternary order which
ot, however, integrated into a whole, and do not reach the
dividuality of the next higher order. The term zoöd is also
ionable as involving the idea of individualized organs, a view
al while the medusoid gonophores (à la Hydra) on were looked
evolved of its homologue in Hydra, whereas the latter is
a degenerate form of the former. Passing to the vegetable
, here as before the cell is the unit of the first order, while
gate representing almost every stage in the insensible evolu
f a secondary unit are far more abundant than among animal
lete unity of the second order can hardly be allowed to the
us, which Spencer proposes to compound and integrate into
ry aggregates—the higher plants, as in animal the embryo
l method is preferable, both as avoiding gratuitous hypothe
s leading to direct results. Such a unit is clearly presented
e embryo of higher plants in which the cell aggregate is at
differentiated into parts and integrated into a whole. Such
bryo possesses axis and appendages, as where fully dev
2). The latter, however, being as organs more [illegible] exp
of the concentric layers into which the plant embryo, like the
l, is differentiated, and so neither stages of evolution nor
le of separate existence, are not entitled to individual rank
mbryo, the bud, shoot, or uniaxial plant, all that belong to
econd order of individuality, like the Hydroid they resemble
the lower Coelenterates, too, aggregates of such axes are
ed by branching out from their low degree of integration
colonies can hardly be termed individuals of the third, much
ot higher order, at least without somewhat abandoning that
of treatment of plants and animals without which philosophi
iology disappears. Individuality of the second order is most
reached by the flower,—the most highly differentiated and
integrated form of axes and appendages. Such a simple
as a raceme or umbel approximates to unity of the thi
to which a composite flower head must
be admitted to have attained, while a
compound inflorescence is on the way
to a yet higher stage.

If, as seems probable, a nomencla-
ture be indispensable for clear ex
pression, it may be simply arranged
in conformity with this view. Start-
ing from the unit of the first order,
the plastid or *monad*, and termi
any undifferentiated aggregate a *deme*,
we have a *monad-deme* integrating
... - ondary unit or *dyad*, thi
rising through *dyad-demes* into a
triad, this forming *triad demes*, and
these when differentiated becoming
tetrads, the Botryllus colony with which the evolution of co
individuality terminates being a *tetrad deme*. The separat
form, whether monad, dyad, triad, or tetrad, requires also s
tinguishing name for which *person* will probably ultimately
most appropriate, since such usage is most in harmony with
table physiological and psychological connotations, while th
logical individual of Gallesio and Huxley, common also to all
gories, may be designated with Haeckel the *cœnobium* or
cycle, the complete series of forms ne represent the
being the *species cycle* (though th with the for
in cases where the sexes are separate, or polymorphism
For such a peculiar case as *Diplozoon paradoxum*, wh
separate forms of the same species coalesce, and still more
heterogeneous individuality as that of a Lichen, where a
unit arises from the union of two altogether distinct forms
and Alga, yet additional categories and terms are require

layers.

§ 5. *Promorphology*. Just as the physiologist constant
to interpret the phenomena of function in terms of me
physical, and chemical laws, so the morphologist is ten
inquire whether organic as well as mineral forms are n
reducible to simple mathematical law. And just as the c
grapher constructs an ideally perfect mathematical form
imperfect or fragmentary crystal, so the morphologist has fr
attempted to reduce the complex-curved surface of organi
to definite mathematical expressions.[1] Canon Moseley (*Phil*
1838) succeeded in showing by a combination of measure
mathematical analysis, that the curved surface of any tu
or discoid shell might be considered as generated by the re
about the axis of the shell, of a curve, which continually v
dimensions according to the law of the logarithmic spir
Goodsir this logarithmic spiral, now carved on his tomb
a fundamental expression of organic curvature and the d
new epoch in natural science that of the mathematical m
tion of organic form—and his own elaborate measurement
body, its organs, and even its component cells seemed t
now the trianole, and again the tetrahedron, as the fund
form. But such supposed results, exhibiting more of the
philosophic than of sober mathematic, could only serve
courage further inquiry and interest in that direction.
find that even the best treatises on botany and zoology
the subject, satisfied with merely contrasting the ample geo
round-forms of crystals with the highly curved and he
complicated lines and surfaces of the organism.

But there are other considerations which lead up to a
metical conception of organic form, those namely of symm
regularity. These however, are usually but little de
botanists since Schleiden contenting themselves with t
organisms into three groups, first, absolute or regular,
regular and radiate, third, symmetrical bilaterally or zyg
the first being capable of vision into two halves only in
plane, the second in two or more planes, the first in mo
Braun (later), and more fully Bronn, introduced the fund
improvement of defining the mathematical form, they so
by the surfaces, but by axes, and their poles; and Hae
developed the subject with an elaborateness of detail and
[illegible] as unfortunately to have impeded its s
a sketch of which the main results may, with slig
tions chiefly due to Jäger (*Lehrb. d. Zool.*, 1878), be fo
lined.

A. *ATAXONIA*, forms destitute of axes, and cons
wholly irregular in form, *e.g.*, Amœba and many Sponges.

B. *TAXONIA*, forms with definite axes.

---

1 See Haeckel, *Gen. Morph.*, i., [illegible] ; Sachs, *Lehrbuch d. Bot.*, Pasch, *Allgemeine [illegible]* ; Rose Perrier, *Les Colonies Animales*, 1881, as from these and other referen obtained.

2 The sciences of organic and mineral forms would thus (as Hae out) become theoretically [illegible] for a more complete [illegible] graphy of organic form, so mineralogy, as the study of [illegible] of pseudomorphism or of mineral development, become [illegible]

…erties, and its greater adaptability to the environment.
…ssification into *bilateral* and *radiate* forms which usually
…duty for more precise promorphological conceptions must be
…done; as hopeless discontinuous or essentially different forms, or at
…must be greatly restricted. The term radial to regular and
…pyramid, the term bilateral to the Centropoeda if not ind
…ciplined forms. Similarly, the topographical and relative
…anterior and posterior, upper and under, horizontal and ve
…must be superseded by the terms above applied to the axe
…their poles, oral and aboral, dorsal and ventral, right and le

6. *Nature of Morphological Change.* – The main forms of o
…structure having been ascertained and classified and their stage of ind
…ality being ascertained, the question next arises, by what mo
…logical changes have they arisen, and into what categories ev
…mode of differentiation be grouped? They at first sight
…innumerable, yet in reality are few. Goethe somewhat v
…generalized them for the flower as ascending and descending
…morphosis, expansion and contraction of organs, &c., but th
…attempt at careful enumeration seems to be that of Auguste
…Bravais, who recognized defect of development, adherences, e
…of production or "dedoublements," metamorphosis and di
…ment of organs. Subsequent authors have variously treate
…subject: thus Asa Gray enumerates as modifications of the fl
…coalescence, adnation, irregularity, abortion, non-alternat
…antiposition, multiplication, cohesion, unusual development
…axis, and other morphological modifications connected with
…ction. These are obviously too numerous, as may best be
…by a single comparison with the view of an animal morphe
…Thus Huxley, in discussing the arrangement of the Verte
…recognizes only three processes of *modification*, not only
…ancestral evolution of the Equidæ, but in the individual de
…ment of animals generally, these are "(1) excess of develo
…of one part in relation to others, (2) partial or complete su
…sion of certain parts, (3) coalescence of parts originally dis
…It is probable that this "threefold law of evolution" may i
…all observed cases of change, even in the flower; thus Chori
…Peloria may be regarded as peculiar forms of excess, while di
…ment is probably in all cases only apparent, and really
…adhesion or coalescence (see BIOLOGY, vol. iii. p. 681 *sq.*).[1]

§ 7. *Nature of Morphological Correspondence – Catege
Homology.* To indicate all the steps by which the idea o
…phological has been distinguished from that of physic
…resemblance would be to examine the whole history of morph
…it must suffice to discuss the terminology of the subject whi
…as ever, served not only as an index but as an engine of pr
…For these two distinct forms of resemblance the terms *ho*
…and *analogy* gradually became specialized, and were finally
…lished and clearly defined by Owen in 1843, – "the former
…same organ in different animals under every variety of for
…function (*e.g.*, fore-limbs of *Dasyurus talpinus* and wings of Bir
…second as a part or organ in one animal which has the same fu

Huxley, *Proc. Zool. Society*, p. 619, Lond., 1880.

…part or organ in a different animal (*e.g.*, parachute of …wing of Bird)." He further distinguishes three kinds …gy: (1) *special*, being "that above defined, namely, the …den…ce of a part or organ determined by its relative position …nexions with a part or organ in a different animal, the …ation of which homology indicates that such animals are …ed on a common type," *e.g.*, ba…dial process of human … with bi…ero…cipital of bird; (2) *general*, that "higher …n which a part or …ne of part…s stud…d to the fundamental …l type, involving a knowledge of the type on which the …question is constituted," *e.g.*, the … human bone and …of the lu…bar vertebræ; (3) *serial* homology, "repe… …or repetitive relation in the segment…ation of the same skeleton" …nated when general and special homologies have been …ed, thus usually the bi…ero…cipital and bra…phenoid …motype." These terms were hereafter accepted by …ts; but the criterion of analogy and homology became …sis and other embryological developmental as well as …ive, reference to the ideal archetype becoming less …t frequent. Passing over the discussion of Agassiz and …of which the latter is entirely and partly incorporated …ed, we find the last prominent phrase coined under general …, interesting categories of homologies parallel's corre… to those of individuality, *a homotaxy* of antimeres …tinct from that of Owen's *homodynamy* of metameres, …*nomy* of part arising on the vertebrate …s, homotypy …homology in terms of identity of embryonic origin. In …last point we have fully noted upon by Ray Lan…ho decomposed into two others, proposed to supersede …homology, to *homogeny* hence the correspondence of …de…ent and *homoplasy*, denoting any superinduced …dence of position and function in part…embryonically …Thus the fore-limb of a mammal is *homogenous* with …t bird, but the right not left ventricle of the heart is only *homoplastic*, the chamber…s undergoing similar …gence of both groups from a more central type are to be …to similarity of physiological needs. Mivart next pro… retain homology as a term to vary…homogeny, and …y to two species under it and erect the nerves into …tail, disregarding all but twenty-two but little fifteen …correspondences. Of part…s multifunctional only, *e.g.*, …ard and Lobster's 20 part…s unite both in function and …position, wing of Bat and Bird…s part of common …fore-limb of Horse and Rhinoceros…s part of morpho… …n origin whatever be their present remote relations, *e.g.*, …s of Panther and Perch, "separated by similar embryonic …whatever be their present general relations, *e.g.*, legs of …; 6, 7, 8, 9, 10 lateral, ventrally serially intercos… …ly, and radially homologous parts of abundant …nucleus, *e.g.*, points of attachment, 12 and 13 secondary …ary subordinate to 11 homologous, 11 and 12 special …ral homologies in Owen's sense. In his *Kritik der exakten …* proposed to term *homoiatia* the truly phylogenetic …y in opposition to *homoiomeria*, to which he…s hereby …ng; and finally Von Ihering has published a repetition of …r's views.

…s discussion, as in that of individuality, it is evident that …ealing with numerous logical processes, but by concen… …g, no doubt, to the complex web of inter-relations presented …e, yet remaining in need of discrimination. Thus we …t aside analogies of functional activity, the resemblances …al shape or geometrical ground-form which correspond to …, Hydrozoa and Bryozoa, Echinoderms and Ctenophores, …re, are nevertheless, as our historic survey showed, the …s to attract attention, and the archetypes or homomorphs …as Haeckel has shown, comes entirely within the province …morphology as do homoplasy or homogeny, with that of …gnological collocome the cryptotypes. Here, too, …considered "radial," "vertical," "lateral" homodynamy …py of antimeres, and all questions of symmetry, for which …s nomenclature of *homaxonial, homopolar*, &c., is devised …le. Entering the field of tectology or morphology in the …sense, we may next consider whether two organisms …e of the same category of individuality are *homogenous*, …der this or that homology, for instance, would come under …ivision, the correspondence between the units or parts of …a linear dyad, deme or triad. From a third point of view, …he embryologist, we trace the development of each multi… organism (1) from the embryonic layers and systems into …e secondary unit (gastrula or plant embryo) differentiates, …a unit-deme or unit of the inferior order or orders of …ality. The parts and units thus recognized by ontogenetic …, respectively or successively *homodermic*, *homosystemic*, *…nodemic*, may then conveniently be termed (undifferently …considerations of priority) either "specially homologous," …genous," "homophylic," or "homogenetic," in the language …genetic theory. These three great classes of morphological …correspondence—promorphological, tectological and embryologi… …may or may not coincide. But the completest homolog… …in which all forms of resemblance unite and from which the …differentiate, is that expressed in the cell theory, or rather in the …ovum theory which underlies it, and which Agassiz therefore …naively regarded as "the greatest discovery in the natural sciences …of modern times."[1]

Its Results to Taxonomy. The advance and modification …clusions which follow each morphological advance have been …pointed out above, and taxonomy thus never quite reaches a level …with morphological knowledge. That it require… much reform… …present is obvious. Although the dogma of the constancy of species …is no longer maintained, it is still suggestive, and perhaps a majority …of groups have still to be monographed in the generalizing spirit …with which Huxley treated the Colcareous Sponges, or Carpenter, Parker and Rupert Jones the Foraminifera. The union of the …Protozoa and Protophyta into the Protista, a consummation which …research is continually confirming, involves a final abandonment of …the medieval fragment of three kingdoms of nature, and a revival of …the Oken-Lamarck conception of Common Physiological properties are now …completely compelled, hence for the time, the constant attempt …to separate Animals and Vegetables by physiological characters …(i.e., which would be present or absent in the whole Animal …exactly morphological characters must be applied to the connective …of the theoretical, the premises of evolution, and the …are, however, not accurate to the stages of evolution …in beauty or intelligence, but is determined mostly by position …in the … reference to another, to the degree of morphological …differentiation by which … appreciate or condemn which the …exhibit. That the supreme position of Man in the Creation must …be abandoned, since the Primates are simply one of the five groups …(*i.e.*, Insecta or Arthropoda, Mollusca, Vertebrata, Annulata and the Mammalia themselves …on the whole certainly less specialized than the land or perhaps even …inferior to Insecta Reptilia. The morphological importance of the …so-called Lower Vertebrates, such as Amphioxus, Ascidians, Tunicata, Cyclostomes, Ganoids, Dipnoi, Amphibia, Ichthyopsida, …with appendages, and a notochord, have been compared not with …the central cavities or nervous system, but more especially with that …homomorphic or better homotypic with them as vertebrates …is reducible to …tes and upward … too small to be seen and in the Hydromedusæ, which have only the mesoderm and endoderm, are invaginated into the space …or cavity of the blastula, which … thus be called the archenteron …the blastopore or primitive mouth. Tubularia, …although a Coelenterate, has a true anus (Hincks).

Its Relation to Morphology and Physiology. Although the purely morphological investigation of the last decade has rightly claimed the exemption of its advancement, not from yet all be…penetrated, apart from physiological considerations, but labour would be unsupported and results unexplained if not made …subservient to … Long before Goethe, the plant, the …head and chapter seemed to an apparently permanent …fundamental comparison that of cell but another adaptation …from the relative size of successive adaptation till …exposure of the most specialized adaptive characters, at …settled to be of various degrees of constancy, and often …of no importance. The morphological aspect of an organism …merely the … and has that of readily observable …ones, truly enough when viewed as it does, but …, there is the reason to … the structural unity of …

primeval flower from a somewhat fern like Cryptogam, of which foliage leaves, the envelopes of the spore bearing leaves, the ro and macro potangio-phore- had become permanently differ- ated in a centhner order, of which the microspores, doubtless ough the intervention of a spore eating insect, had come to ger ate upon the microsporangium instead of upon the ground, and hich the variation (evidently advantageous, nice making fertil- tion at once more certain and more economical) was added to per- nate at first to the contemporaneous evolution of those floral colours l, is now current even among the Thallophytes. And thus the mor ogist, though excluding teleological and functional considera- s from his anatomical researches, has yet a physiological ideal, and is sooner or later upon a new series of inquiries those of the ndependence of structure and function Milne Edwards's law of hysiological division of labour, Dohrn' principle of functional ange, the speculations of Claude Bernard, Spencer, and Haeckel, xperimental inquiries such as those of Semper where organ-ms subjected to special modifications of their environment and like are all contributions to this newest and evolutionary artment of morphology. Such ideas are even applied to the ld of cellular morphology. Thus Spencer points out the relation of the shapes of cells to their environments; James ingeni explains the occurrence of cell division by the rapid increa bulk over surface which the growth of a solid involves, and corresponding increase of difficulty of nutrition; and the w has attempted to explain the forms of free and united cel specializations of a protomyxoid cycle in which variations of tional activity are accompanied by the assumption of correspon forms, the whole series of changes depending upon the prope of protoplasm under the variations in the supply of energy the environment. Rauber, Hy, and others have even attempt explain embryological phenomena in terms of the simplest cel mechanics, but as yet such speculations are somewhat crude.

(J. M.) *Organization and Subdivisions of Morphology.*—The pos of morphology in the classification of the sciences and the p mode of subdividing it cannot be discussed within these li although the latter is peculiarly the subject of much disagree The position above assumed that of including under morpho the whole general aspects of the organic world, is that of Hae Spencer, Huxley, and most recent animal morphologists, bot frequently, however, still use the term under its earlier and limited significance. (P. G.)

MORRIS, Robert (1734–1806), American statesman, born at Liverpool, England, on 20th January 1734 [illegible] the age of thirteen he accompanied his father to America, and after serving in a countinghouse at Philadelphia became in 1754 partner in the business. From 1776 1778 he was delegate to the Continental Congress, and was one of those who signed the Declaration of Inde- pendence. During the war he served on the committee of ways and means, and freely placed his immense wealth at the disposal of his country his personal credit being at one time pledged to the amount of £1,400,000. He also 1780 established the Bank of North America, and until 84 acted as superintendent of finance. In 1786 he be- came a member of the Pennsylvania legislature, and he was one of the convention which framed the Federal constitu- tion in 1787. From 1786 to 1795 he was United States senator. On account of the depression consequent on the financial speculations Morris passed the later years of his life in a debtor prison. He died at Philadelphia, 8th May 1806. Robert Morris had as his assistant superin- tendent of finance Gouverneur Morris (1752–1816), with whom he was associated also in several mercantile enterprises. Gouverneur Morris, who rose to some eminence as a states- man and orator, was more fortunate in his speculations than his colleague, and latterly became celebrated for the munificence of his hospitality. He was the author of a series of essays on currency and finance, which are included in the *Life, Correspondence, and Writings of Gouverneur Morris*, 3 vols., edited by Jared Sparks, 1832.

MORRIS-DANCE, or Morrice-dance, a performance which for a time associated with certain festive seasons in England but now wholly discontinued. The origin of the name is doubtful, and whether the dance was indigenous [illegible] was introduced by John of Gaunt from Spain or was borrowed from the French or Flemings, must be left to conjecture. That, as the name would seem to indicate, it was a development of the morisco dance of Spain is certainly not however, invalidated by the fact that the morisco was for one person only, for, though latterly the morris-dance was represented by seven characters, modernity in this respect was not always observed, and the element of the dance may have been borrowed from the morisco. There are few references to it earlier than the reign of Henry VII, but it would appear that in the reign of Henry VIII. it was an almost essential part of the principal village festivities. Although allusions to it in poems are very frequent in the 16th and 17th centuries nothing more than fragmentary descriptions have been handed down to us, so that an accurate knowledge of its characteristic features at even any particular period is impossible. In earlier times it was usually danced by five men and a boy dressed in a girl's [illegible] musicians; and, at least sometimes, one of the dan more gaily and richly dressed than the other, acted "foremarch of the morris." The garment of the dan were ornamented with bells tuned to different notes so sound in harmony. Robin Hood, Friar Tuck, and L John were characters extraneous to the original da and were introduced when it came to be associated the May games. At Betley, in Staffordshire, there painted window of the time of Henry VIII., or ea portraying the morris, the characters including Maid Marian, Friar Tuck, the hobby horse, the piper, the tabo the fool, and five other persons apparently represen various ranks or callings. The hobby horse, which, lat at least, was one of the principal characters of the d consisted of a wooden figure attached to the person o actor, who was covered with trappings reaching to ground, so as to conceal his feet. The morris-dance dedicated alone with the May games and other fe tiv by the Puritans, and, although revived at the Re tora the pageant gradually degenerated in character and dec in importance. Maid Marian latterly was personate a clown who was called Malkin. Though the dance is wholly discontinued, it is probable that some of the ori elements of it still survive in a country dance which, the same name, is still popular in the north of Engla

See Douce, "Dissertation on the Ancient Morris-Dance," *Illustrations of Shakspeare*, i. 139; Strutt, *Sports and Pastimes of the People of England*; and Brand, *Popular Antiquities* (1849).

MORRISON, Robert (1782–1834), the first Protestant missionary to China, was born of Scottish parents at Morpeth, Northumberland, on 5th January 1782. After receiving an elementary education in Newcastle, he was apprenticed to a last-maker, but his spare hours were devoted to studies connected with theology, and in 1803 he was received into the Independent academy at Hoxton. In the following year he offered his services to the London Missionary Society, by which, after he had attended for a session college of Gosport, and studied Chinese under a native teacher, he was sent to Canton in 1807. He was appointed translator to the East India Company's fa

n 1808, and, in addition to his official duties con- with this post, laboured with intense application *Chinese Grammar* and a translation of the New ent, both of which were published in 1814. In e published *A View of China for Philological Pur-* nd his translation of the entire Bible was completed following year. His next enterprise was the estab- nt of an Anglo-Chinese at Malacca for "the eal cultivation of Chinese and European literatu was opened in 1820. In 1821 his *Chinese Dictionary* blished by the East India Company at an expense ,000. Leaving China at the close of 1823 he spent rs in England, where he advocated Chinese mis- lar large and enthusiastic audiences, and was elected a of the Royal Society. Returning to China in 1826 him-elf to promote education and to prepare a commentary on the Bible and other Christian re. He died at Canton on 1st August 1834. His s, compiled by his widow, were published in 1839 , 8vo, London).

RISTOWN, a city of the United States, county Morris county, New Jersey, lies on the Whippany 31 miles from New York by the Morris and Es- of the Delaware, Lackawanna and Western Rail It was twice the headquarters of the American uring the War of Independence, and Washington- ce, owned by the Washington Association, is sited State's a half mile to the east. On Whippanong m, 3 miles distant, stands the State mansion known called Morristown, Avhom, a vast granite building st long, erected in 1874–1875 and capable of ac- mmodating 1000 patients. The population in 1880 18.

RSE, SAMUEL FINLEY BREESE (1791–1872), artist ventor, was born at the foot of Breed's Hill, Charles lassachusetts, on 27th April 1791. His father was v. Jedediah Morse, D.D., the author of *Morse* *aphy*. At the age of fourteen Samuel Morse entered ollege; under the instruction of Professor Day and n he received the first impulse towards those che- tudies with which his name is mainly identified. l Morse, whose tastes during his early years lean- ore strongly towards art than towards science, be- e pupil of Washington Allston, then the greatest of an artists, and accompanied his master to England he remained four years. His success at this period nsiderable, but on his return to America in 1815 ed to obtain commissions for historical painting, working on portraits for two years at Charleston, removed first to Washington and afterwards to , finally settling in New York. In 1826 he had ndations of the National Academy of Design, and ected its first president, an office which he held for 8 to 1845. The year 1827 marks the revival of Morse in electricity. It was at that time that he learned rofessor J. F. Dana of Columbian College the ele- y facts of electromagnetism. As yet, however, he voted to his art, and in 1829 he again went to to study the old masters.

year of his return, 1832, may be said to mark the of his artistic, and to open that of his scientific life rd the packet-ship "Sully," which sailed in 1st October 1832, while discussing one day with ow passengers the properties of the electromagnet, led to remark: "If the presence of electricity can e visible in any part of the circuit, I see no reason telligence may not be transmitted by electricity." not a novel proposition, but the process of formu- t started in his mind a train of new and momentous The current of electricity, he knew, would pass instantaneously any distance along a wire, and if interrupted a spark would appear. It now o to him that the spark might represent a part of either a letter or a number; the absence of the another part, and the duration of its absence, or spark itself, a third, so that an alphabet might be formed, and words indicated. In a few days completed rough draft of the necessary apparatus he displayed to his fellow passengers.[1] During the years that followed Morse was engaged in a painful s to perfect his invention and secure for it a proper pr tion to the public. The refusal of the Government mission him to paint one of the great historical pict the rotunda of the Capitol seemed to destroy all artistic ambition. In poverty he pursued his new purpose, making his own models, moulds, and castings mechanically the common necessaries of life and encom embarrassment and delay of the most disheartening It was not until 1836 that he completed any app that would work, his crowning idea having been mented by his discovery in 1835 of the "relay," by of which the electric current might be reinforced on where it became weak through distance from its Finally, on 2d September 1837 the instrument exhibited to a few friends at his room in the uni building, New York, where a circuit of 1700 feet of wire had been set up, with which the factory to ma awaken the practical interest of the Messrs Vail, ir iron-workers in New Jersey, who thenceforth becam connected with Morse in his undertakings. Morse's p for a patent was dated 28th September 1837, an soon followed by a petition to Congress for an priation to defray the expense of subjecting the tel to actual experiment over a length sufficient to e its feasibility, and determine its value. The com on commerce to whom the petition was referred, re favourably. Congress however, adjourned without the appropriation, and meanwhile Morse failed to to take out patents there. The trip was not a In Prussia his application was rejected, on the ground that his invention had been already pub and while he obtained a patent in France, it was quently appropriated by the French Government compensation to himself. His connection with proved fatal, and after a year's absence he return New York. On 23d February 1838 Congress pa long-delayed appropriation, $30,000, to enable Morse to construct a telegraph from Baltimore to Washingto on the 24th of May 1844 it was used for the firs Morse's patents were already secured to him and h ciates, and companies were soon formed for the erec of telegraph lines all over the United States. In th 1847 Morse was compelled to defend his invention courts, and successfully maintained his claim to be the original inventor of the electromagnetic recordin graph. The interest and Morse's life was spent now with the growth of his creation, and in gathering the h which an appreciative public bestowed upon hi was unable to receive from the various foreign G of which he was the distinguished citizen, while in 1858 the entative of Austria, Belgium, France, the Nethe Piedmont, Russia, the Holy See, Sweden, Tus Turkey appropriated the sum of 100,000 francs in ition of the use of his instrument in those countri the preparations for laying the first Atlantic cable an active part, though the attempt of 1857, in wh personally engaged, was not successful. He died 2

[1] Five years later the captain of the ship identified ma Morse's completed instrument with that which Morse had on board the "Sully" in 1832.

TALITY TABLES. See Insurance, vol. xiii. p

RTGAGE. The general object of mortgage is to money debt by making it a charge on land, or other debt be not paid by a time agreed upon between the the creditor may sell the property and pay himself the proceeds. In English law the mortgage is a nce of the land or chattel to the creditor, on condition only to re-convey it to the mortgagor should he the time fixed upon for repayment to which the property incident duly to convey it is pect. An absolute conveyance, however, is necessential to the purpose of mortgage.

history of mortgage in Roman law presents three well marked stages. In the first, the property was conveyed absolutely to the creditor, who merely ant (*obligavit*) to reconvey it when the debt should . All the interest, however, in the property passed the debtor to the creditor, and, should the latter to reconvey, there was no remedy to the original except a personal action. In the second stage *pignus*) the property did not pass to the creditor, ly received possession of the thing pledged, together right of sale, &c., in the event of payment not ng at the time appointed. Lastly, without parting the possession even of the pledge the debtor ld a lien or charge (*hypotheca*) over it in favour creditor, who acquired thereby a right on failure ment to follow the thing by real action against the or, who could be sought for, and to repay himself he proceeds of the sale.

mortgage of English law is the result of two different ideas. Its origin and form belong to the common he restriction by which it is made to serve the of a security only, and nothing more, belong to the of equity. In the eye of the common law the gee was the owner of the estate conveyed in the ge; in equity the mortgagor remains the real owner, e mortgagee is merely an encumbrancer. A, the of land in freehold, conveys to B and his heirs, with so that on repayment of money lent by B to A, on a future day, with interest until payment, B or his will reconvey the estate to A and his heirs, and that default be made in payment, A and his heirs may without interruption from B and his heirs." The common mortgage of land, and at law, after failure payment, the land belonged absolutely to the mortgagee while in the meantime, before payment, the legal estate was considered to be vested in him, subject only to be defeated by payment at the proper time. The Court of Chancery first interfered in the reign of James I. to allow a redemption after forfeiture, and a case in the reign of Charles I. decides that payment after forfeiture had the same effect as payment before. The right of the mortgagor to redeem his estate after it has been forfeited according to the terms of the deed, is called his equity of redemption. No agreement between the parties was allowed to oust the jurisdiction of the court, or to deprive the debtor of his equity of redemption. And this equity of redemption was at first regarded as a mere right of the debtor, but was established in course of time as an estate in land which descended to the heirs of the mortgagor. On the other hand, the interest of the mortgagee as part of his personal estate, and passed to his executor and not to his heir. In spite of the terms of the mortgage, the owner of the land was still the owner, and the mortgagee is a creditor only for the money he advanced and the interest thereon. It is quite from whether a given deed is a conveyance by way of mortgage, and the courts, in deciding, will look at the circumstances of the case, and will treat it as a mortgage when it was the real intention of the parties that it should operate as a security only. Thus, if the price was grossly inadequate, if the purchaser was not let into immediate possession, if he accounted for the rents to the grantor, retaining an amount equivalent to interest, if the expenses of the deed were borne by the grantor, there would be reason to believe that the conveyance was only meant to be by way of security. And "once a mortgage, always a mortgage," but subsequent agreements can change its character.

A mortgagee may, however, on default of payment, file a bill of foreclosure requiring the mortgagor to pay the amount of the debt with interest and costs by an appointed day, or else be for ever debarred and foreclosed of his equity of redemption. The effect of failure to pay by the time appointed is not to make the mortgagee absolute owner of the property, but the court in any foreclosure suit may, at the request of either party, order a sale instead of a foreclosure. A power of sale is now implied as one of the incidents of the mortgage, unless forbidden or varied by express stipulation. The mortgagee is entitled to retain out of the proceeds of the sale the amount of his principal, interest and costs, the surplus belonging to the mortgagor. The mortgagor cannot require the creditor to receive payment before the time appointed in the deed; and, on desiring payment at the appointed time, he must give the creditor six months' notice of his intention to pay off the mortgage, so that the creditor may have time "to look out for fresh security for his money."

When the same land is successively mortgaged to different persons, their rights take priority according to their dates in logical order. But the operation of equitable doctrines in the formation of the law of mortgage leads to an important modification of this rule. Of the successive mortgagees, the first only takes the legal estate, and therefore according to the maxim of the Court of Chancery, which will turn the scale when there is an equality of equitable rights between two contracting parties. Thus, if the third mortgagee had no notice at the time of making his advance of the existence of the second mortgagee, the equities of the two claimants are supposed to be equal, and if nothing else intervened priority of time would decide the case

ghts. But if the third mortgagee gets an assign- the first mortgage, he can *tack* his third mortgage first, and so postpone the second mortgagee. And rst mortgagee himself makes an additional advance e date of the second mortgage, but without notice is whole debt will take precedence of the second gee. A similar result of equitable rules is seen in nsolidation of securities. Two separate estates, ged at different times and for different sums of by the same mortgagee to the same mortgagee, are d as consolidated, so that the whole of the land s security for the whole of the money, and the annot redeem either mortgage without redeeming ner. So that, as Mr Justice Williams remarks, no can safely lend money on a second mortgage, for, tion to the risk of a third person creating *tacking*, there anger that, if the mortgagor should have mortgaged r estate for more than it is worth, the holder of the st security may buy up the first mortgage, consolidate with his own, and exclude the second mortgagee *Equitable* mortgages are created simply by the of title-deeds as security for money advanced etment of the Statute of Frauds that no action shall ught on any contract or sale of lands, or any interest s in or concerning them, unless the agreement be ng and signed by the party to be charged, has been s incompatible with the free creation of equitable es, but it is enacted by Lord Westbury's Act that the Act never meant to affect equitable mortgages. The deed ures the evidence of title which is required in on at law and, if the mortgagor sues in equity the ould require the execution of a legal mortgage by repayment oney borrowed on the deposit. Any subsequent ortgagee, having notice of the deposit, will be post to the equitable mortgagee; and with the legal gee has not imposed a duty to call for the deed there out pense to him such a mortgagee would have ed if he had made inquiries.

MORTON, JAMES DOUGLAS, 4TH EARL OF (*c.*1530–158 regent of Scotland, second son of Sir George Douglas Pittendreich, was born at Dalkeith in 1530. Having married Elizabeth, daughter of the third earl of Mort he threatened her succession to the title and e of the latter in 1553. After the return of Queen Mary had been elected provost of Edinburgh and in 1563 became Lord High Chancellor. Though sympathising w Protestantism, he took no part in the conspiracy of Protest tatione in 1565, but he headed the armed force of 150 m who took possession of Holyrood Palace to get the as sination of Rizzio secured. It is believed that the lead conspirators had determined to murder or imprison Mary's consort to the Scottish throne. The que before completing with the request, escaped to Dunb castle on her return to Edinburgh with an escort of 2 men. Morton joined the other Protestant lords in Englan her return with Darnley, Morton returned, and w good terms at the Berwick, Carlisle, where queen, on the death of Lord Darnley retired. He conference at Cuckney H part in obtaining the com of the queen at Lochl to an abdication. The reg he was to cooperate Lord High Chancellor, and to succeed Bothwell's Lord High Admiral. On the death of the of May he became regent (October 1572). Through to take measures to overthrow the crown power, by the comm of Argyll, widow of the earl of Moray, Morton awake the latter's murderers of Ruthven and Athole, who per the young King James VI. to resume the governme Morton deemed prudent to retire and for a time ret to Lochleven, but shortly afterwards, with the assist of his nephew, the earl of Mar, he obtained possession Stirling Castle, where the king was residing, and thro a troop raised by his influence. Suddenly, howe Stewart, earl of Arran, of hav taken part in the murder of Darnley, the father of King, and been tried by a jury of sixteen peers, mo whom were his enemies, was condemned to death and headed on 2d June 15[illegible].

MORVEAU. See GUYTON DE MORVEAU.

MOSAIC (late Greek ψηφωτός, from ψῆφος, a s stone; also *pavimentum*, *i.e.* pebbled, delicate work, hence Latin *opus musivum*) is the fitting together of m generally small, pieces of marble, opaque glass, colo clays, or other substances so as to form a pattern,

may be of various degrees of elaboration, from the st, almost monochromatic, geometrical pattern to st elaborate picture, with figure subjects represented ns of countless gradations.

earliest existing specimens of mosaic belong to less important branches of the art namely, the entation on a small scale of jewellery, ivory thrones, her furniture, or more rarely of some elaborate archi- l ornament. Most of this earliest sort of mosaic ol- in execution what are called *cloisonné* enamels. Louvre and in the British Museum are preserved ery beautiful ivory carvings in low relief, some from ch and others from Egypt, in which figures of deities, nts formed of the lotus and papyrus plants, and artouches are enriched by small pieces of glass or azuli and other gem-like stones, which are let into made in the ivory. Each minute piece is separated he next by a thin wall or *cloison* of ivory, about as cardboard, which thus forms a white outline, and the brilliance of the coloured stones. The favourite in this sort of work for decorating the larger sur- ppears to have been suggested by the feathers on a wings. See Ivory, vol. xiii. pl. vii. fig. 3.

ent excavations at Tell el Yahudiya in Lower Egypt brought to light some mosaics on a larger scale, but d in the same way. These are caps of columns, walls nd other objects, either of white lime stone or earthen- ware, on which designs, chiefly consisting of the papyrus med by brilliantly coloured bits of glass or enamelled ware, let into a coating on the tile or column. orm of mosaic was employed by the Greeks, the heum at Athens, both in the middle of the 5th v. B.C., had the base of one of its white marble s ornamented with a plait like design, in which of coloured glass were inserted to emphasize the ne of the pattern.

ther, quite different sort of mosaic was known to ypians of the Ptolemaic and Roman period. This entirely of glass, and is extremely minute. The known specimens in the British Museum, it is a ll let about three-eighths of an inch square, apparently el of a ring, on which is represented the sacred every feather on the bird's wing being produced a great number of colours and tints, each minute di- and so inlaid [illegible] strong magnifying glass it ld look enough like detail.

way in which this wonderful little mosaic was pro- is extremely interesting. Number of long thick ed coloured glass were arranged in such a way that d all round so as to form the The whole bundle of thick rods of glass when looked ways presented the figure of the hawk with a oad contour, somewhat larger than it afterwards be The bundle was then heated till the rods melted ther, and the whole thick rod, softened by fire, was drawn out to a greatly diminished thickness. In rods the original positions of the thick rods of coloured pattern, though not altered. A slice of the as then cut off, and the face polished, the design reduced in size, of course, but equally visible at ides of the slice, and like the micro-cosmic minute the mosaic was protected with a tortoiseshell de- ornament; many slices, each showing the same e, could be cut from the same rod.

more important use of mosaic has been on a large either for pavement or for wall and vaulted ceil- Mosaic for these purposes has by many writers, both t and modern, been divided on various systems into s, perhaps the simplest classification is the following:-

I. *For Pavements*: (*a*) *Tesselated*, in which the is formed of small cubes, generally of marble, more of glass or clay; (*b*) *Sectile*, formed of larger pi marble, shaped and cut so as to fit accurately on another. II. *For Walls and Vaults*: *Tectile or v lated*; pieces of opaque glass, in small cubes, arran as to form complicated pictures.

This classification is not altogether satisfactory than one method often being employed in the same e.g., in the "Opus Alexandrinum" of mediaeval which is often partly tesselated and partly sectile.

Until Roman times we know but little of these k mosaic. There is some evidence (in Pliny and writers) to show that elaborate mosaic pavement *emplecton* or *Asarotos oecus*, were made by the Greeks 4th century B.C., or even earlier; but most of t merous fine specimens of tesselated work still exis Greece, such as those at Sparta and Athens, must ferred to the time of the Roman occupation. Th examples of Hellenic mosaic are some pavement covered during the recent excavations at Olymp fig. 1 and *Mittheilungen aus Olympia*, 1877, p. 2).

Among the Romans the use of mosaic, both of and opaque glass, was very extensive. Accord Pliny (*N.H.*, xxxvi. 2 6), they derived this art fr Greeks, but not until the time of the Third Punic W B.C., while glass mosaics for walls, "vitrea pa were a recent invention in his time. Many of the been found at Pompeii, most commonly they are decorate niches for fountains or statuette. Judgin the description given by Vitruvius (vii. 1), and an ex tion of numerous specimens of Roman tesselated m

Fig. 1.—Greek Pavement from the Temple of Zeus at Olympi

the process of manufacture was the following. Th was first carefully rammed down to a firm and even s on this was laid a thick bed of stones, dry rubbish, an called "rudus," from 6 to 9 inches deep, and abo another layer, 4 to 6 inches thick, called "nucleus," part of lime to three of pounded brick, mixed with on this, while still soft, the pattern could be sketch with a wooden or metal point, and the tesserae or sm of marble stuck into it, with their smoothest sides most. Lime, pounded white marble, and water wo mixed to the consistency of cream, forming a ver setting cement, called "marmoratum." This cemen liquid, was poured over the marble surface, and well into all the interstices between the tesserae. Wh

concrete and cement were both set, the surface of the pavement was rubbed down and polished. This kind of mosaic was largely used for floors of hypocausts; the concrete bed was then supported on large tiles resting on numbers of short pillars.

If used for upper floors very strong joists were required, and both Pliny (xxxvi. 25) and Vitruvius (vii. 1) recommend a *double* layer of boards, one crossing the other, on which the concrete and cement bedding was to be laid.

The usual Roman pavement was made of pieces of marble, averaging from a half to a quarter of an inch square, but rather irregular in shape. A few other, but quite exceptional, kinds of mosaic pavements have been found, such as that at the Isola Farnese, 9 miles from Rome, made of tile like slabs of green glass, and a fine Oecetile pavement on the Palatine Hill, made of various shaped pieces of glass, in black, white and deep yellow. In some cases (*e.g.* in the "House of the Faun" at Pompeii) glass tesserae in small quantities have been mixed with the marble ones, for the sake of greater brilliance of colour. Pompeii is specially rich in its mosaics both on floor and walls, almost every house having at least its vestibule paved in this way.

In addition to the flowing patterns and geometrical designs, pictures like the [illegible] of great elaborateness frequently occur. Of these the most important is the large one now unfortunately lost, the scene of the battle of Issus, found in the "House of the Faun." It is of special value as being the direct copy of a picture of high [illegible] existing. It was a well-designed though somewhat crowded composition, representing the moment of Alexander's charge against the cavalry of Darius. The expression of the face and the characteristic dress of the Greeks and Persians are represented with great skill even in the [illegible] of the case in this out-of-work, as the one to the smaller it is only about one tenth of an inch square, to be preserved for the floor, where greatest refinement of detail was required. The wall decoration mosaic, though generally the [illegible] inlaid wood work, was affixed to walls.

The most skilfully-executed of the existing specimens of the pictorial kind is that known as the Pliny Dove, found in Hadrian's villa at Tivoli, and now in the Capitoline Museum. It was probably the one so highly praised by Pliny (xxxvi. 25) in the words of Sosus, for, although he describes the Pergamum, as it was a common practice with the Romans to remove the mosaics from one place to another, and this very composition may well have been brought to Tivoli to adorn the emperor's villa. It is [illegible] in a very realistic way: the hair on the gold bowl, the plumage of the doves, and especially the reflections on the water of the drinking dove, are represented with wonderful skill. It is in fact, far too pictorial, and, like the late mosaic in St Peter's, Rome, is more remarkable for its technical skill than for any

This excessive realism, produced with great difficulty and cost, is not uncommon fault of the more elaborate Roman mosaics, and was the inevitable result of the luxury and ostentation of imperial Rome, which made art the bond-slave of the wealthy rather than the free and natural expression of a whole people as it was among the earlier Greeks.

Another interesting mosaic from the wall of a house at Pompeii, of extreme delicate work, is a richer classical scene in a cool shady grove where the choregus is instructing the actors in their parts, remarkable from its being signed as the work of Dioscorides of Samos. Other figure-subjects are not uncommon, such as various representations of the victory of Theseus over the Minotaur, a story of Achilles in Scyros, many hunting scenes and the like.

Throughout England, Germany, France, Spain, Asia Minor, and Northern Africa in no way have traces of Roman occupation been left so clearly and in such conspicuous a form as by the numerous large and generally well preserved mosaic pavements which have at various times been discovered in all these countries. In many cases, long after all traces of the walls of the buildings have disappeared, owing to their being dug up and removed for building purposes, the mosaics still remain to testify of the artistic power and mechanical skill of the Roman colonists.

Few countries are richer than England in these remains: the great pavements of York, Woodchester, Cirencester, and many other places are as elaborate in design and as skilfully executed as any that now exist even in [illegible] itself. In whatever country these mosaics are their style and method of treatment are always much the same; the materials only of which the tesserae are composed vary according to the stone or marble supplied by the country. In England, for instance, limestone often takes the place of the white marble so common in Italian and North African mosaics; while, instead of marble, a fine sort of burnt clay or red sand-stone is occasionally used; other make-shifts had to be resorted to, as many of the Anglo-Roman mosaics are made entirely without marble. It is perhaps partly owing to the wealth of Northern Africa in marble of many colours and of varying shades that the finest of all Roman mosaics have been found in Algeria and Tunis, especially

Part of Pavement Head-piece to the Battle of Issus, fo

from Carthage, one of which have been brought to the British Museum. See *Archæologia*, vol. xxxviii. p. [illegible].

The range of colour in the marbles to [illegible] and [illegible] and [illegible] are three or four different shades of red and a number of yellow and green, the last colour not being almost peculiar to the part of Africa, and of the most pleasant and harmonious in almost all situations. Deep black brown, and blush-grey are abundant. The white marble which forms the ground nearly all the decorations is often not pure white, but stained with grey, giving great softness and beauty of texture to the surface, and doing away with too much sense of force. The Roman practice, common in their mosaics, of not letting the tesserae quite fit together, but allowing the cement joints to show, was also of great value in giving effect to the beauty of texture of the surface, a point quite forgotten by later mosaic workers who thought that the closer the tesserae were fitted together the better the mosaic would be. This remark does not apply to such mosaic, in which sufficient variety can be given by the markings and colour in each piece of marble. To return to the mosaics of Carthage, they are no less excellent in design than in the richness and beauty of their material. Large

ed by grand sweeping curves of acanthus and other
, drawn with wonderful boldness and freedom of
and varied with great wealth of invention. With
e use of very small tesserae, much richness of effect
n be obtained by gradations of tints, suggesting light and
without a painful attempt to represent actual relief.
ders of the marble sanctuary and elsewhere by the
s are so quiet and harmonious that it would have
been impossible to produce with them a hurried
y design, and when used with the skill and knowl-
ledge of the mosaic workers at Ravenna the
is a real masterpiece of decorative design. In
and in the Roman colonies of Europe the kind of
e to be laid was largely governed, with but
alteration in style or method of treatment, till the
ntury. In Syria and Asia Minor the art survived
enturies later.

Wood Mosaic.—The
ral classes: (1) those used to decorate walls and
, made of glass cubes; (2) the floor pavements, made
ble, partly in large shaped pieces, and partly in small
s, (3) glass in small pieces, either rectangular or
ular, used to enrich marble pulpits, columns, and
architectural features, (4) wood mosaic.

The wall mosaics were, in their present, purely Byzan
and appear to date from the beginning of the 5th
y. The ware made of coloured glass, rendered opaque
addition of oxide of tin. The melted glass was cast
ts, especially about half an inch thick, and then
into small cubes. Every possible colour and grada-
of tint was produced by the mediæval glass makers
e of gold (which were very largely used) and of
were made thus: the metal leaf was spread over
the glass slab, the colour of which did not matter
was hidden by the gold or silver, over the metal
slab a film of coloured glass was fused, so as to
the metal leaf from injury or tarnish, and then
ab was broken up into cubes, the *gemmæ vitreæ* of
time writers.

e method of putting together the mosaic was much
me as that employed by the Romans in their tes-
pavements. A thick coat of cement was applied to
all or vault, the outline indicated with a metal point,
he cubes stuck one by one into the cement while it
was yet soft, the main difference being that no rub
down and polishing were required, the faces of the
ts, even showing the natural surface of the fracture, w
was not quite level, and by the slight inequality of su
reat additional lustre and brilliance of effect were g
to the whole picture.

Owing to the intense conservatism of Byzantine ar
o subjects, scarcely any progression can be traced in this cla
ration. Some of the 5th century mosaics at Ravenna
many ways as fine as those of the 12th, and it was
till the end of the 13th century that any important ch
ce took place, when Cimabue, and more especi
his pupil Jacopo da Turita and Taddeo Gaddi, ap
their increased knowledge of the human form and o
harmonies of colour to the production of the most
tiful of all mosaics, such as those in the apse of S. M
Maggiore at Rome. It must not, however, be supposed
during all this time from the 5th to the 14th cent
one steady level of excellence was kept up. The mo
of the 9th century are poor in drawing and ge
treatment, as are both of the earlier and later times, w
in both of these the artist was absolutely restricted du
the 10th and 11th centuries. Extreme splendour of c
and a soft-like brilliance combined with the most st
grand style of form are the main characteristics of this s
decoration. Its most frequent application is to the
domes, arches and roof of the early basilica.

A great deal of symbolism entered into the treatment of the
subjects, which were generally treated in a hieratic manner. In
the apse or over the triumphal arch of the entrance Christ was repres
in glory, to whom the twelve apostles, in the form of sheep
personification, Christ, the Good Shepherd, sometimes de
as a beautiful youth, stood among a circle of sheep, the tree
of the mountains being represented by palm trees, or a
complete picture, as in the tomb of Galla Placid
Ravenna, in the apse of the church, with much of the old Roman
and classic feeling and composition. Frequently the Virgin Ma
the principal figure of the church, occupies the central space
pied by a series of other and smaller subjects.

The Doom, or Last Judgment, a favourite subject for
mosaic worker, the Triumphal Arch being one of the gr
decorative spaces of the Apse, executed in the 13th century,
several instances, and have the scene of Christ's baptism,
Jordan, sometimes represented in a very classical ma
a figure with flowing hair holding an urn from wh
pours forth the waters. S. Vitale at Ravenna has the sanctu
the Presentation of Justinian and his empress
Theodora, attended by a numerous suite of courtiers
which are certainly of the 6th century, and
with dignity, though the fact that he
is represented with a circular nimbus appe
that he was not then alive. Scenes from both Ol
New Testament, or the lives of the saints, are also represen
generally on the walls of the body
in oval shaped pictures, arranged in one or more
over the nave colonnade or arcade.

In most of the best period of the treatment of the f
and draperies is broad and simple, a just amount of
being expressed by delicate gradations of tints. In mo
of the 9th century the drawing is very awkward, an
folds of the robes are rudely expressed in outline, wi
suggestion of light and shade.

A further application of this work was to the decor
of broad band over the columns of the nave, as
Maria Maggiore in Rome, 5th century, and in the
churches of S. Apollinare at Ravenna, 6th century,
one case almost the whole interior of the churc
encrusted in the magnificent way, as at Monreale Cathe
the Capella Palatina of Palermo, and S. Mark's at Ve
the magnificence of which no words can describe;
quite unrivalled by that of any other buildings in
world. See MONREALE.

In these churches the mosaics cover soffits and a
entirely, and give the effect of a mass of solid gold
colour producing the utmost conceivable splendou

decoration.[1] In many cases vaulted ceilings were covered with these mosaics, as the tomb of Galla Placidia, 450 A.D., and the two baptisteries at Ravenna, 5th and 6th centuries. For exteriors, the large use of mosaic was usually confined to the west façade, as at S. Miniato, Florence, S. Maria Maggiore, Rome, and S. Mark's, Venice. In almost all cases the figures are represented on a gold ground, and gold is freely used in the dresses and ornaments, rich jewels and embroidery being represented in gold, silver, sparkling reds, blues, and other colours, so as to give the utmost splendour of effect to the figures and their drapery.

The revival of the art of painting in Italy and the

FIG. 3. Mosaic of Theodora and attendants, from S. Vitale, Ravenna; over life-size.

introduction of fresco work in the 14th century gave the deathblow to the true art of wall mosaics. Though at first the simple and archaic style of Cimabue and his

[1] Unfortunately the world-wide fame of S. Mark's and the other great churches of Italy has subjected these extraordinary works to the fatal process of "restoration," and wherever any signs of decay in the cement backing (the tesserae themselves are quite indestructible) has given the least excuse the "restorers" have destroyed whole masses of ancient work, and supplied its place with worthless modern copies. The mosaics of the S. Mark's baptistery, and of the apse at S. Miniato, at Pisa, and many other places have in this way been wantonly renewed within the last few years.

pupils Jacopo da Turrita, Giotto, and Taddeo G[illegible] was equally applicable to painting or mosaic, yet soo[n] development of art into greater realism and comp[lexity] required a method of expression unfettered by the ne[cessities] and canons of mosaic work. Pietro Cavallini, a R[oman] artist, was one of the last who worked according t[o] old tradition. His mosaic of the birth of the Vir[gin] S. Maria in Cosmedin, Rome, executed about the m[iddle] of the 14th century, is not without merit, though [his] superior knowledge of form has only caused his co[n]ception to be somewhat feeble and insipid compared wi[th] works of the earlier artists. Even in the 15th cent[ury] few good mosaics were produced at Venice and el[se]where. Since then many large pictures have been copied in mosaic, generally attempts to imitate oil painting, exe[cuted] with great skill and wonderful patience, but all [of] worthless as works of art, merely costly monuments [of] human folly and misapplied labour. The mosaics [of] Titian's pictures on the west end of S. Mark's at V[enice], Raphael's in the Chigi Chapel in S. Maria del Popol[o], many large pictures in S. Peter's in Rome, are the [most] striking examples of these.

The following list, a chronological order comprises [a] selection from among the most important mediæval and [early] mosaics, the period when mosaic work[manship] was at its [highest].

S. Marco Cappella Grimani walls by Pietro Cavallini, c. 1310
SS. Giovanni e Paolo arch over effigy of Doge Morosini

It is by no means exhaustive, and only gives some of the most typical examples of the mosaic work of each century. The time origin of these great wall mosaics, wherever executed, is amply proved both by internal and documentary evidence. The gorgeous mosaics of S. Sophia and S. Saviour's in Constantinople, 6th century, and the later ones in the monasteries of Mount Athos, at Sclonic and at Daphne near Athens, are identical in style with those of Italy of the same date. Moreover, the even more beautiful mosaic-work in the "Dome of the Rock" at Jerusalem, 7th and 11th centuries, and that in the sanctuary of the great mosque of Cordova, of the 10th century, are known to be the work of Byzantine artists, in spite of their thoroughly Oriental designs. The same is the case with the rare mosaics of Germany, such as those in S. Gereon at Cologne and at Parenzo.

The very remarkable, almost unique, specimen of Byzantine mosaic preserved in the "Opera del Duomo," Florence. This is a work of the 11th century, of extremely minute, almost micro-mosaic work, in tesseræ of glass and metal, perhaps the only example of mosaic made of solid metal. It has figures of saints and inscriptions, each tessera being scarcely larger than a pin's head. This mosaic originally belonged to the imperial chapel in Constantinople, and was brought to Florence in the 14th century.

Of the second mediæval class, mosaic pavements, though of great interest, are of less artistic importance.

The so-called "Opus Alexandrinum" is very common throughout Italy and in the East, and came to great perfection in the 12th century. It is made partly of small marble tesseræ forming the lines of the pattern, and partly of large pieces used as a ground or field. It is generally designed in large flowing bands which interlace and enclose circles, often of one stone sliced from a column. The finest examples that at S. Mark's, Venice, of the 12th century. The materials are mainly white marble with green and red porphyry, and glass.

Of the countless churches in Italy possessing these beautiful pavements, such as S. Lorenzo, S. Marco, S. Maria Maggiore, and S. Maria in Trastevere, in Rome, we have in the Chapel of the Sacrament, and in front of the high altar of Westminster, very fine specimens of this work, executed about 1268 by a Roman artist named Oderisius, who was brought to England by Abbot Ware, on the occasion of a visit made by the latter to Rome. Another fine example is the mosaic pavement in front of the shrine of St. Thomas at Canterbury. This is probably the work of an English artist, though the materials are foreign, as it is partly inlaid with glass, a peculiarity never found in Italy. There are also many fine examples of these pavements in the churches of the East, such as that in S. Sophia at Trebizond, of the most elaborate design and of rich materials, very like the S. Mark's pavement at Venice. Palermo and Monreale are especially rich in examples of secular work, used both for pavements and walls, in the latter case usually for the lower part of the walls, the upper part being covered with the glass mosaics. The designs of these Sicilian mosaics, mostly executed under the Norman kings in the 12th century, are very Oriental in character, and in many cases were actually executed by Moslem workmen. Fig. 4 gives a specimen of this work

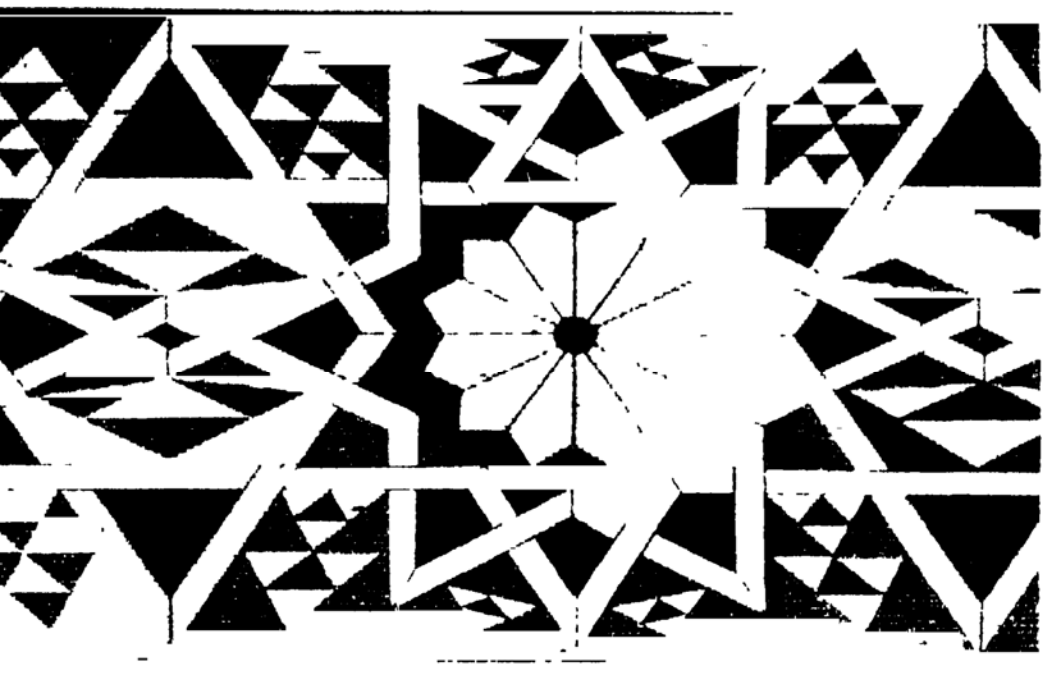

Fig. 4. Marble Mosaic of Monreale (Sicily).

from Monreale cathedral. Its chief characteristic is the use of curved lines, so largely used in the splendid opus Alexandrinum of Italy, arising from the fact that this class of Oriental work was mainly used for the delicate panelling in wood on their pulpits, doors, &c.,—wood being a material quite unsuited for the production of large curves.

3. Glass mosaic, used to ornament ambones, pulpits, episcopal thrones, baldacchini columns, architraves, and other similar objects, is chiefly Italian. The designs, when it is used to cover flat surfaces, such as panels or architraves, are very similar to those of the pavements last described. The white marble is used as the matrix in which sinkings are made to hold the glass tesseræ. The columns are frequently ornamented with a spiral band of this mosaic, or flutings are suggested by parallel bands on the columns. The cloisters of S. Giovanni in Laterano and S. Paolo fuori le mura have splendid examples of these enriched shafts and architraves.

This style of work was largely employed from the 6th to the 13th centuries. One family in Italy, the Cosmati, during the latter part of the 13th century, was especially skilled in this craft, and the various members of it produced an extraordinary amount of rich and beautiful work. The pulpit in S. Maria in Ara Coeli, Rome, is one of the finest specimens (see fig. 5), and are also the ambones in S. Clemente and S. Lorenzo and that in Salerno cathedral. The tomb of Henry III., 1291, and the shrine of the Confessor, 1269, at Westminster are the only examples of this work in England. These were executed by "*Petrus et Romanus*," probably a pupil of the Cosmati.

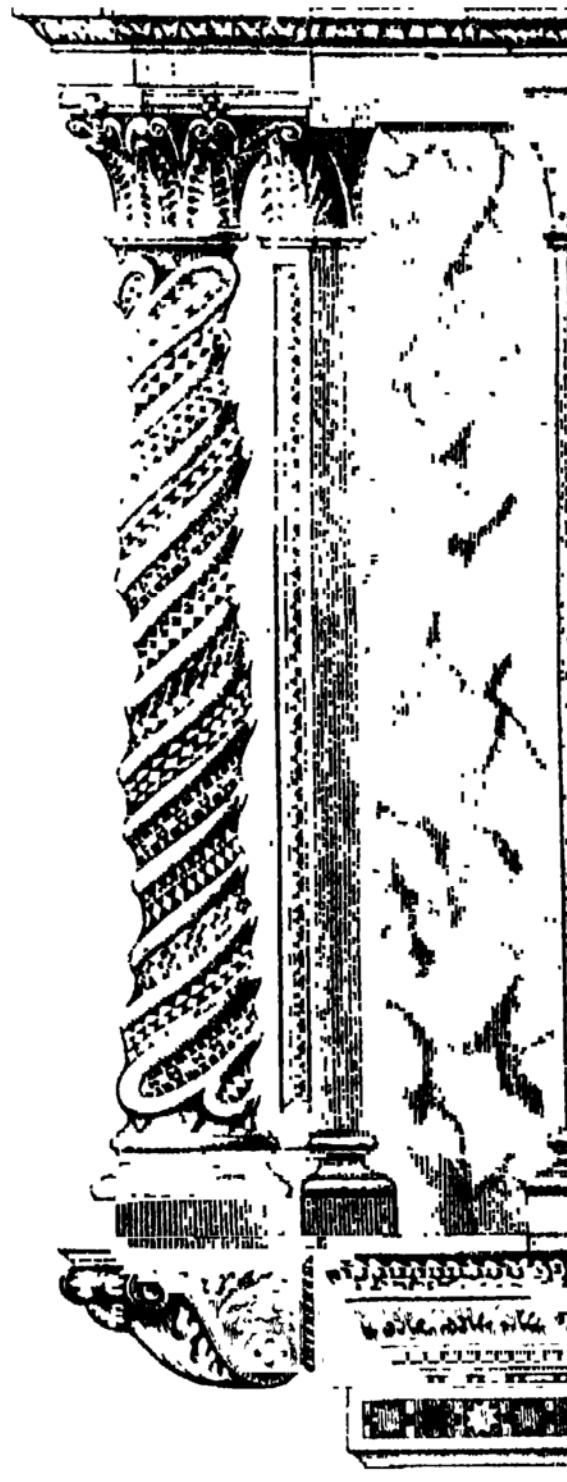

Fig. 5. Part of Marble Pulpit with mosaic, church of Ara Coeli, Rome.

In India, especially during the 17th century, many Mohammedan buildings were decorated with fine marble inlay of the class now called "Florentine." This is *scagliola* mosaic, formed by shaped pieces of various-coloured marbles let into a marble matrix. A great deal of the Indian mosaic of this sort was executed by Italian workmen, the finest examples are at Agra, such as the Taj Mehal.

The modern so-called "Roman mosaic" is formed of short and slender sticks of coloured glass fixed in cement, the ends which form the pattern, being finally rubbed down and polished.

Many not unsuccessful attempts have been made lately to reproduce the Roman tessellated work for pavements; and at Murano, near Venice, glass wall-mosaics are still produced in imitation of the magnificent works of mediæval times.

4. Mosaics in wood are largely used in Mohammedan buildings, especially from the 14th to the 17th century, the finest specimens of this work are at Cairo and Damascus, and chiefly to decorate the magnificent pulpits and other woodwork in mosques. The patterns are very delicate and complicated, the inlay of small pieces of various coloured woods, often enriched by bits of mother-of-pearl and minutely carved ivory. The general effect is extremely splendid from the combined beauty of the materials and workmanship, as well as from the marvellous grace and fancy of the designs. This art was also practised by the Copts of Egypt, and much used by them to ornament magnificent iconostases and other screens in their churches.

Another application of wood to mosaic-work, called "Certosina," was very common in Italy, especially in Tuscany and Lombardy during the 15th and early 16th centuries. Its chief use was for the decoration of the stalls and lecterns in the choirs of churches. Very small bits of various coloured woods were used to form geometrical patterns, while figure subjects, views of buildings, strong perspective effects, and even landscapes, were very successfully produced by an inlay of larger pieces. Ambrogio Borgognone, Raphael, and other great painters often drew the designs for this sort of work. The mosaic figures in the panels of the stalls

Certosa near Pavia were by Borgognone, and are extremely beautiful. The stalls in Siena cathedral and in S. Pietro de' Casmenci at Perugia, the latter from Raphael's designs, are among the finest works of this sort, which are very numerous in Italy. It has also been used on a smaller scale to ornament furniture, and especially the "*Cassoni*," or large trousseau coffers, on which the most costly and elaborate decorations were often lavished. Some traditional skill in this art still lingers in Italy, especially in the city of Siena.

MOSCHELES, IGNAZ (1794–1870), one of the most refined and accomplished pianists of the present century, was born at Prague, 30th May 1794, and first studied music at the Conservatorium in that city under the direction of Dionys Weber. At the age of fourteen he made his first appearance before the public in a pianoforte concerto of his own composition with marked success. Soon after this he removed to Vienna, where he studied counterpoint under Albrechtsberger and composition under Salieri. In 1814 he prepared, with Beethoven's consent, the pianoforte arrangement of *Fidelio*, afterwards published by Messrs Artaria. In the following year he published his celebrated *Variationen über den Alexandermarsch*, a concert piece of great difficulty, which he played with so great effect that he was at once recognized as the most brilliant performer of the day. He then started on a tour, during the course of which he visited most of the great capitals of Europe, making his first appearance in London in 1822, and there securing the friendship of Muzio Clementi and John Cramer, the fathers of the English school of pianoforte playing. For a concert given by the latter he wrote his famous *Hommage a Handel*, a duet for two pianofortes, which afterwards became a lasting favourite with the public. His reception in England was sufficiently encouraging to justify his return in 1823, when he again met with a hearty welcome. During a visit to Berlin in 1824 he first became acquainted with Mendelssohn, then a boy of fifteen; and a friendship sprang up between them which was severed only by Mendelssohn's early death.

In 1826 Moscheles relinquished his wandering habits, and settled permanently in London, surrounding himself with a *clientele* fully capable of appreciating his talents as an artist and his social worth as a firm and loyal friend. His position was henceforth a more than ordinarily enviable one. He was recognized from end to end of Europe as a *virtuoso* of the highest rank; and his popularity both as a performer and as a teacher was based on grounds which effectually secured it from the caprice of changing fashion or ephemeral patronage. He was undoubtedly for some considerable time the greatest executant of his age; but, using his brilliant touch as a means and not as an end, he consistently devoted himself to the further development of the true classical school, interpreting the works of the masters with conscientious fidelity, and in his extemporaneous performances, which were of quite exceptional excellence, exhibiting a fertility of invention which never failed to please the most fastidious taste.

In 1837 Moscheles conducted Beethoven's Ninth Symphony at the Philharmonic Society's concerts with extraordinary success; and on this and other occasions contributed not a little, by his skilful use of the baton, to the prosperity of the time honoured association. During the course of his long residence in London he laboured constantly in the cause of art, playing at innumerable concerts both public and private, and instructing a long list of pupils, who flocked to him, in unbroken succession from the year 1818, when, at Mendelssohn's earnest solicitation, he removed to Leipsic, to carry on a similar work at the Conservatorium then recently founded in that city. In this new sphere he worked with unabated zeal for more than twenty years, dying 10th March 1870.

Moscheles's most important compositions are his Primolo cottos, Sonatas, and Studies, his *Hommage a Handel*, and three celebrated *Hi ns de Bravoure*.

MOSCHUS, of Syracuse, is one of the Greek poets; he was a friend of the Alexandrian grammarian Aristarchus (about 200 B.C.). His chief work is the epitaph of Bion of Smyrna, another of the bucolic poets who seem to have lived in Sicily. It is probable that the miscellaneous collection of poems which we possess under the three poets, Theocritus, Bion, and Moschus was known to Artemidorus in 200 B.C. His poetry is the work of a well educated man with a trained artistic eye; he modelled his works on those of Bion, writing epigrammatic, epic, or idyllic or elegiac verses, all except a few lines being in hexameter verse; but he treats all his subjects in a descriptive, not in a narrative or an epigrammatic manner. Besides the epitaph of Bion, he wrote two little epics, "Europa" and "Megara," and a pretty little epigram, "Love the Runaway," and a few short pieces of which also preserved. They are written with much elegance, but the style is perhaps too refined and carefully wrought, and he has few of the higher qualities of a poet.

MOSCOW, a government of Central Russia, bounded by Tver on the N.W., Vladimir and Ryazan on the E., Tula and Kaluga on the S., and Smolensk on the W., having an area of 12,808 square miles. The surface undulates, with broad depressions occupied by the rivers, and varies in elevation from 500 to 850 feet. Moscow is situated in the centre of the so-called Moscow coal-basin, which extends into the neighbouring governments, and consists of limestone of the Upper and Lower Carboniferous formation, the latter containing beds of inferior coal, the former containing several good quarries of marble. Carboniferous formation is covered with Jurassic sandstones and sand, which yield a good china-clay, coppers, and some much employed for brick and a white sand used for the manufacture of glass. The whole is thickly covered with boulder clay and alluvium.

The government is watered by the Volga, which skirts a few miles of its southern boundary, by the navigable Oka, flowing in a concentric curve with the canals leading to St Petersburg and by the Moskva. The last takes its rise in the government, with a course of 280 miles right across it, joins the Oka at Kolomna, and is navigable from there to Moscow. The Oka and Volga from a remote period have been important channels of trade, and continue to be so notwithstanding the development of railways. The Oka connects the government into water communication with the Volga, whose tributaries nearly the whole of middle [illegible] and are, by short land carriages, [illegible] North Dwina and the Volga. Large quantities [illegible] kins and other manufactures are shipped up and down the Moskva, whilst the Volga conveys quantities of [illegible] supply the capital with building stone. There are several marble [illegible] in the

also, as well as in the north-east, notwithstanding the rse consumption of wood in manufactures and for fuel in the l, extensive forests are still found. Very large supplies of r are also imported by rail or river, especially from the adjoin outh-eastern provinces. The soil is somewhat unproductive verage crops ranging from 3¾ to 4½ returns; agriculture ywhere, but only two districts (Ruza and Volsk e port corn, all the others being more or dependent rn consumption. The agricultural holdings of the peasan ry small, and their condition on the whole unsatisfactory crops have one important use in several districts, and kitchen ning is an important source of wealth in Verea, Dmitrofl, ventsovsk. Cattle are not extensively reared, but the hors ng industry is somewhat important.

population, 1,038,709 in 1864, numbered 1,191,709 in 1873, and is more urban. They are nearly all Great Russians and to the Greek Church, or are nonconformists. Many are ved in factories, the number of which in 1879 was 1,446, ying 165,000 hands, and having an annual production of 250,000,000 roubles. The returns show the manufacturing activity of Moscow to be greater than that of any other Russian ernment, while the value produced is upwards of one fifth of for all Russia in Europe, including Poland. Cotton, n, and silk are the chief products. The sanitary tion of the factories is very bad; the number of children fifteen years employed is as high as 16 per cent., the hours ly work are often 13 to 16, and the mortality very great. tal income obtained by the population of the government from manufacturing industry is estimated at £48,600,000. The chief e of the people derived however, from a variety of petty industries, carried on in their villages by the peasants, who continue same time to cultivate the soil. Taxation during the last few years has been increased rapidly, and in some parts of the nment has risen to the extent of 2 roubles per head. The centres of trade are Moscow, Kononnic, Serpukhoff, Bogorodsk ney, Ljubercy and Pavlovsk. There are 850 fairs. Transport is mainly ated by railways and by good highroads radiating from apital Moscow; a division into thirty districts, the last with their respective populations, is: Moscow 670,000, odsk 6000, Bronnitsy 7500, Ruza 4000, Kolomna 8500, khoff 16,500, Podolsk 11,000, Zvenigorod 7500, Mozhaisk Volokolamsk 3000, Klin 6,000, Dmitroff 7600, and Verey In addition to these administrative centres may be mentioned Yo kresensk 5000, Bronnitsy 7500, in the bourhood of the Moscow trial town and Pavlovsk more important for and trade than the r towns.

Many of the villages

for trade. The Bvelyi Gorod, which was formerly e by a stone wall (whence the name), surrounds the K and the Kitay Gorod on the west, north, and nor A line of boulevards now occupies the place of i (destroyed in the 18th century), and forms a fin of streets around the centre of Moscow. The Zem Gorod (earthen enclosure) surrounds the Bvelyi including the "Zamoskvoryechie" on the right b the Moskva. The earthen wall and palisade that fo enclosed it no longer exist, their place being take series of broad streets with gardens on both side Sadovaya, or Gardens Street. The fourth enclosu "Kamer College earthen wall") was made during th of Catherine II.; it is of irregular shape, and encl outer part of Moscow, whilst the suburbs and the which have practically extend 4, 5 miles beyond. The general view obtained from t or south is very picturesque, especially on acco the numerous churches, monasteries, and tower characteristic architecture, and the many garde ponds scattered among clusters of houses. The K is an old fort of pentagonal (nearly triangular) sh acres in extent, occupying a hill about 100 feet ab level of the Moskva. It is enclosed by a high sto 2439 yards in length, restored during the present c and having eighteen towers. Its five gates are surm by high towers. The Spasskiya (Saviour's Gat erected in 1491 by a Milanese architect, the Gothi that surmounts it having been added in 1626 English architect Halloway. A sacred picture Saviour was placed upon it in 1685, and all w through the gate must uncover. The towers sur ing the four other gates were erected by order III. Of the sacred buildings of the Kremlin th venerated is the Uspenskiy cathedral. The former of this name was erected in 1326 by Ivan Kahta, it's falling into disrepair, a new one was built on th place in 1475-1479, by Fioravanti, in the Lom Byzantine style, with Indian cupolas. It was r in the 18th century and in 1813. It contains th and most venerated holy pictures in Russia, one o is attributed to the metropolitan Peter, and the Luke. This last was brought from Kieff to V in 1155, and thence to Moscow in 1395; its j metallic cover is valued at £20,000. The cathed es also a gate brought from Korsun, the th Vladimir I., and numerous relics of saints, s which date from the 11th century. The Russian politans and patriarchs were consecrated in this ca as well as the czars, after Ivan IV. The Arkh cathedral was originally built in 1333, and a new erected in its place in 1505. It has suffered ver from subsequent restorations and decorations. It tombs of the czars from Simeon (1353) t Alexeivitch (1696), and possesses vast wealth. T govye chensk cathedral, recalling the churches of was built in 1489; the remarkable pictures of (1410-), contained in the original structure of 139 have been preserved. It was the private chapel czars. Vestiges of a very old church, that of the in the Wood (*Spas na borai*), contemporaneous w foundation of Moscow, still exist in the yard of the A stone church took the place of the old wooden st in 1330, and was rebuilt in 1527. Several other c of the 15th century, with valuable archæological r are found within the walls of the Kremlin. The sensky convent, erected in 1393, and recently r with great judgment, is the burial place of wiv sisters of the czars. The Chudoff monastery, ere 1365, was the seat of theological instruction and

inulet Yauza. The popular idea that Moscow is on seven hills, and in fact the city covers several nees, the altitudes of its different parts varying from to 550 feet above the level of the sea. It is 400 from St Petersburg, 813 from Archangel, 900 from 938 from Astrakhan, 933 from Odessa, and 811 from aw. It lies to the north of the most densely peopled of Russia (the "black earth region"), whilst the ry to the north of it is rather thinly peopled as far e Volga, and very sparsely beyond that. The space en the middle Oka and the Volga, however, was the cradle of the Great Russian nationality (Novgorod Pskov excluded); and four or five centuries ago Mos had a quite central position with regard to the

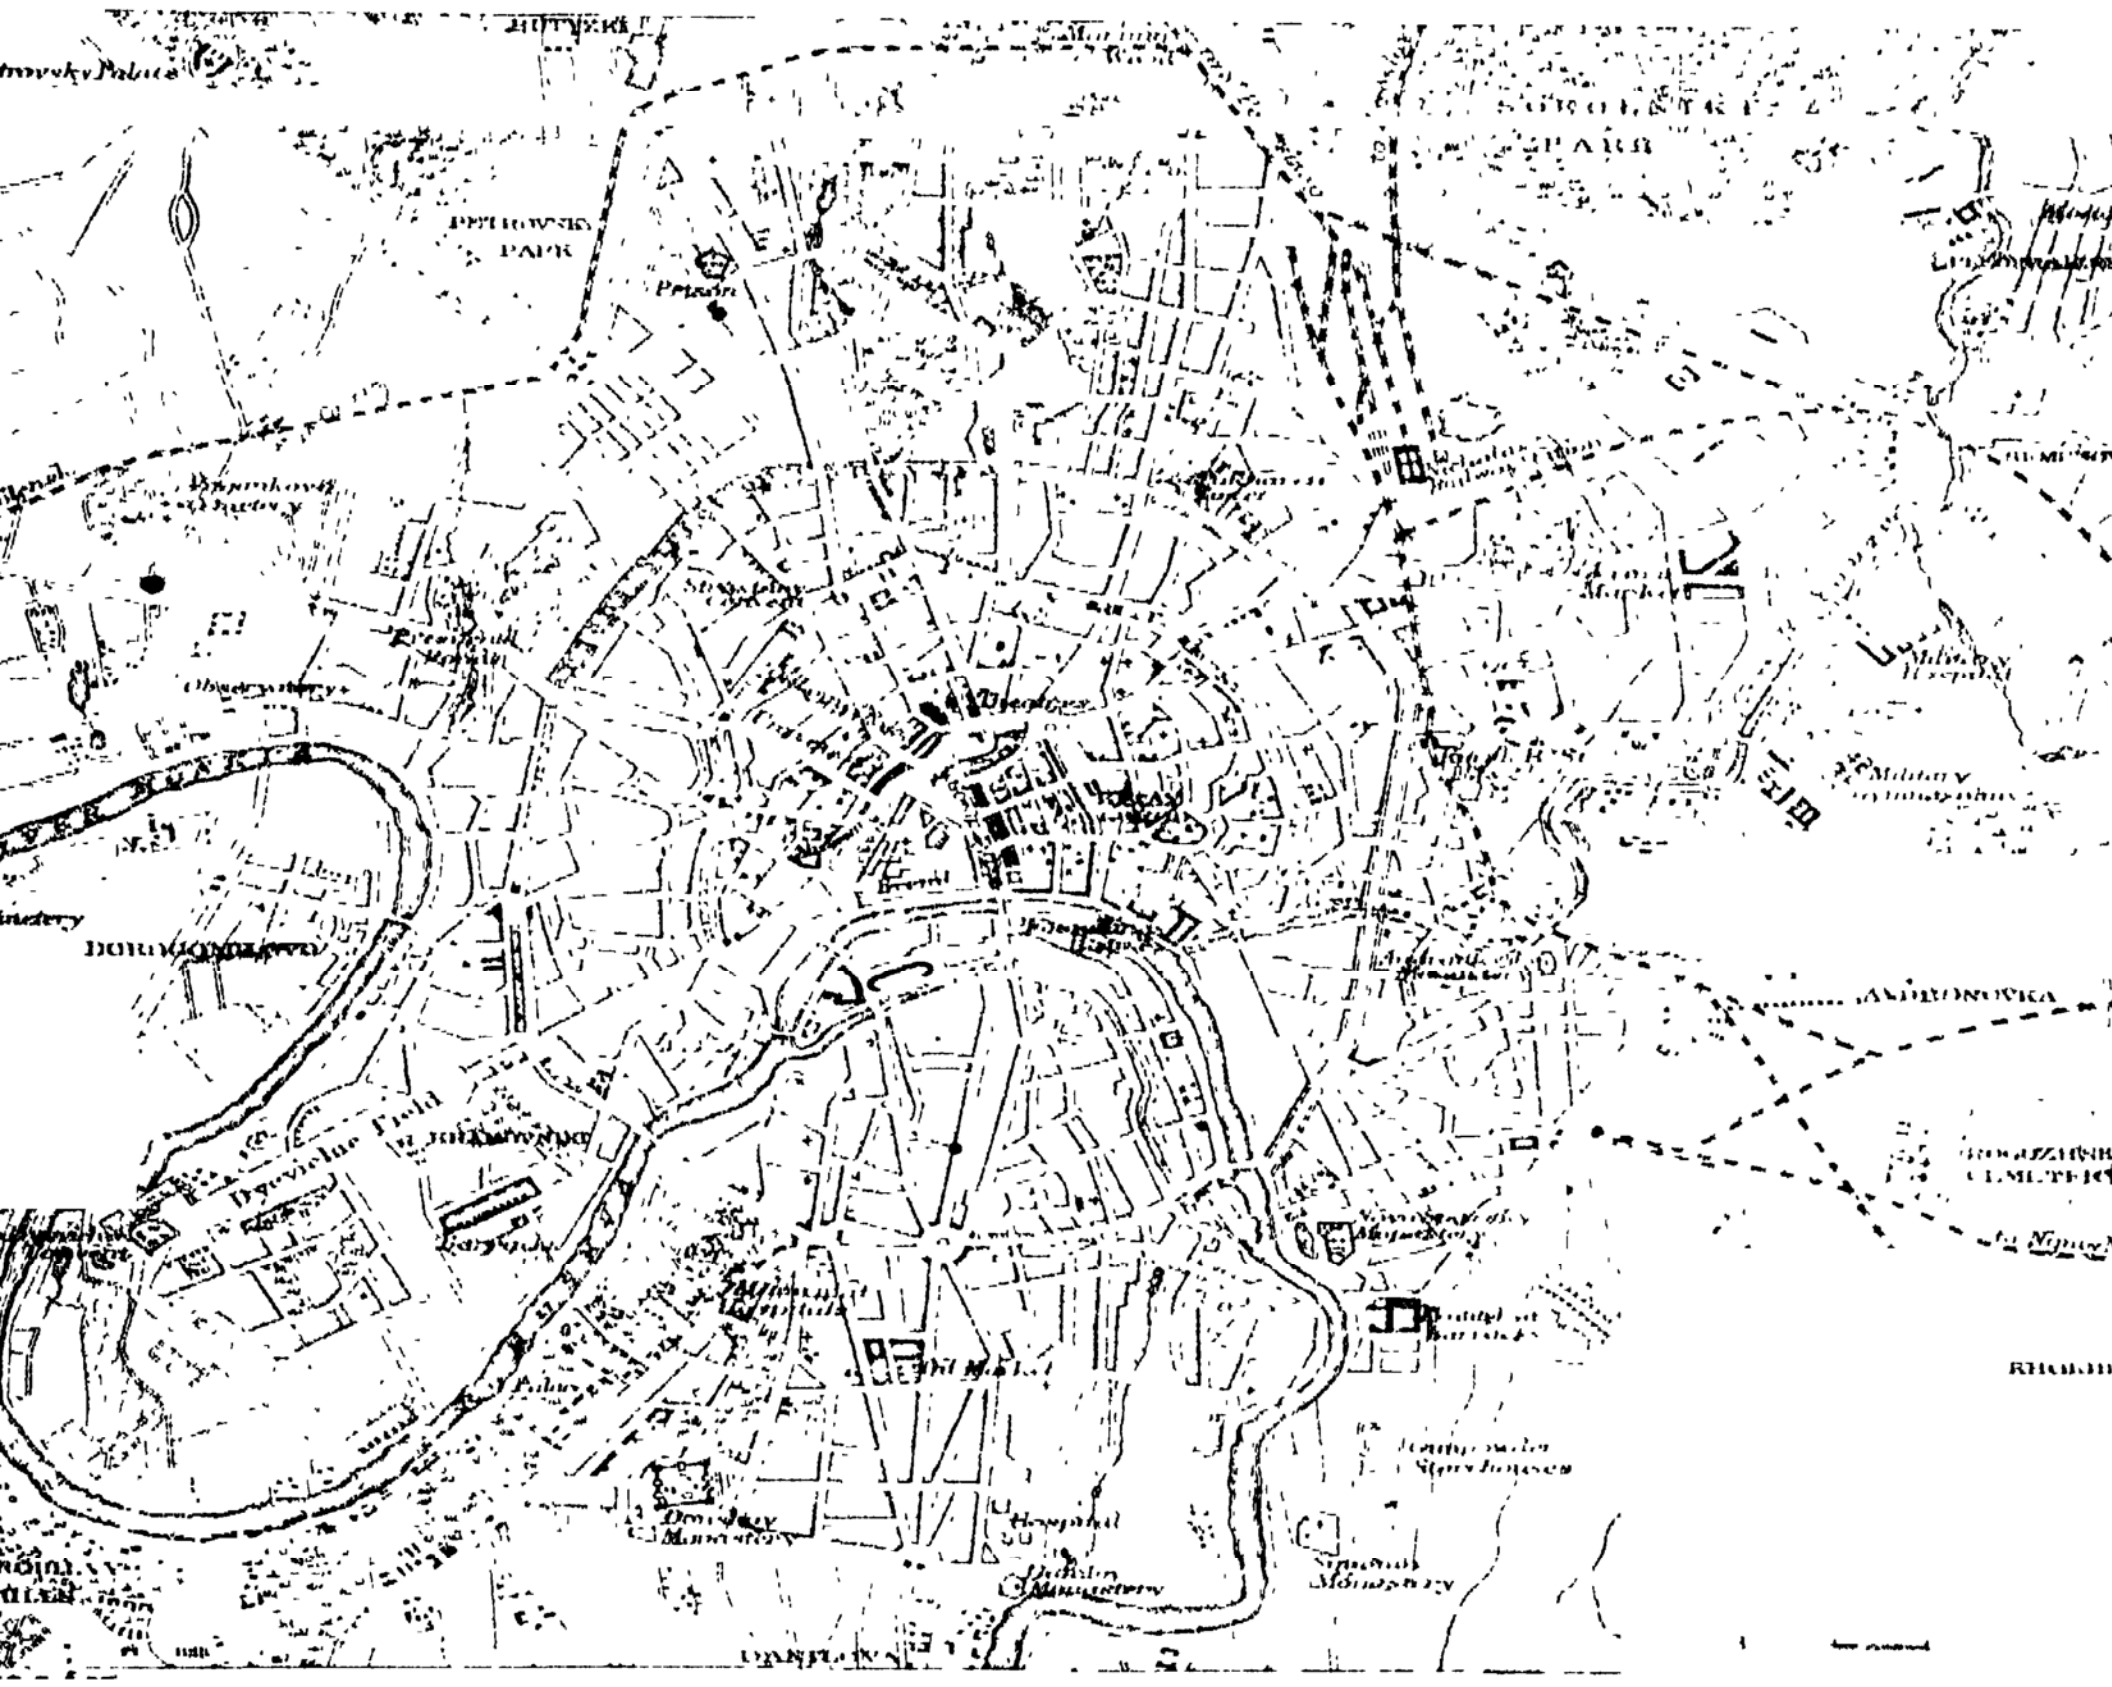
e present city measures 7 miles from north to south, 9 miles from west-south-west to east-north-east, and s an area of 32 square miles (about 10 when the bs are included). In the centre, on the left bank of Moskva, stands the "Kremlin" or Kremlin, occupying Borovitsky hill, which in the 12th century was covered dense forest. To the east of the Kremlin is the Gorod, formerly the Great Road, the chief centre

cording to recent investigations made by the Moscow provincial assembly, 10 per cent. of the agricultural population (about 0 households) have no land at all; 15 per cent., while holding are bankrupt, and 13 per cent. are without cattle or implements.

. Close by, the great campanile of Ivan Veliky, d in the Lombardo-Byzantine style by Boris Godunoff 00, rises to the height of 271 feet (328 feet including ross), and contains many bells, one of which weighs cwts. The view of Moscow from this campanile is wonderful, and its gilded cupola is seen from a great nce. Close by is the well known Tsar Kolokol (Czar of ells), 60 feet in circumference round the rim, 19 feet and weighing 3800 cwt. It was cast in 1735, and n during the fire of 1737 before being hung. The ry of the patriarchs (rizartsa) contains not only such s of value as the *sakkos* of the metropolitan Foty with 0 pearls, but also very remarkable monuments of Ru archaeology. The library has 500 Greek and 1000 very rare Russian MSS., including a Gospel of t century.

The great palace of the emperors, erected in 18 fine building in white stone with a gilded cupola. tains the *terems*, or rooms erected for the young pr 1636 (restored in 1836-49, their former characte maintained), a remarkable memorial of the domestic the czars in the 17th century. In the treasury of th Granovitaya Palata and Oruzheynaya Palata, now museums, the richest stores connected with old archaeology are found crowns, thrones, dresses, article of household furniture belonging to the Russian and Mongolian arms, carriages, &c.

The four sides of the Senate Square are occup



ngs of various dates, from the 15th century onwards. nate, now the law courts, was erected by Catherine Facing it is the arsenal, containing full ammunition 0,000 men.

Temple of the Saviour, begun in 1817 on the iovy hills, in commemoration of 1812, was abandoned 27, and a new one was built during the years 1838 on a hill on the bank of the Moskva, at a short dis from the Kremlin. Its style is Lombardo Byzantine, modifications suggested by the military taste of las I. Its colossal white walls are well proportioned, s gilded cupolas are seen from a great distance. uildings that surround it are to be cleared away, s wide squares adorned by obelisks, and by monu- ments to Kutuzoff, Barclay de Tolly, Alexander Nicholas I.

The Kitay Gorod, which covers 121 acres, an 20,000 inhabitants, is the chief commercial qua Moscow. It contains the Gostinoy Dvor, consist several stone buildings divided into 1200 shops, wh kinds of manufactured article are sold. The "Red S 900 yards long, whose stone ground was formerl forum, and afterwards the place of execution, separa Gostinoy Dvor from the Kremlin. At its lower end the fantastic Pokrovsky cathedral (usually known as Blajennyi), which is the wonder of all strangers v Moscow, on account of its towers, all differing fro other, and representing, in their variety of colours

apples, melons, and the like. It was built under Ivan the Terrible by an Italian. The exchange, built in 1838 and restored in 1873, is very lively, and its twenty-three "exchange artels" (associations of nearly 2000 brokers, possessing a capital of more than £100,000) are worthy of remark. Banks, houses of great commercial firms, streets full of old bookshops carrying on a very large trade, and finally the Tolkuchy rynok, the market of the poorest dealers in old clothes, occupy the Kitay Gorod, side by side with restaurants of the highest class. In the Kitay Gorod are also situated the house of the Romanoffs, rebuilt in 1859 in exact conformity with its former shape; a Greek monastery; and the printing office of the synod, containing about 600 MSS. and 10,000 very old printed books, together with a museum of old typographical implements. At the entrance to the Kitay Gorod stands the highly venerated chapel of the Virgin of Iberia, which is a copy, made in 1648, of a holy picture placed on the chief gate of the monastery of Athos. Close by is the recently opened historical museum, which will contain collections to speci-

fully illustrating separate periods of Russian history.

The northern parts of the Bielyi Gorod are also the centre of a lively trade. Here are situated the Ohotnyi Ryad (poultry market) and the narrow streets Tverskaya and Kuznetsky Most, the rendezvous of the world of fashion. Here also are the theatres. In the south west of the Bielyi Gorod, opposite the garden of the Kremlin, stand the university, the public museum, and the military riding school.

The Zemlyanoy Gorod, which has arisen from villages that surrounded Moscow, exhibits a variety of characters. In the neighbourhood of the railway stations it is a busy centre of traffic; other parts of it are manufacturing centres, while others, for instance, the small quiet streets in the west of the boulevard of Prechistenka, called the old Kogni hennaya, with their wooden houses and spacious yards, are the true abodes of the families of the old, for the most part decayed, but still proud nobility. The Zamoskvoryechye, on the right bank of the Moskva, is the abode of the patriarchal merchant families. Each house is surrounded by a yard whose gate is rarely opened, and each house, with its dependences and garden, bears the character of a separate estate.

The climate of Moscow is cold and continental, but healthy. The average annual temperature is 40° F.; the January 14°; July, 66°. The summer is warm (64° F.), and the winter cold and dry (15° F.), great masses of snow covering the land. The spring, as in all the east-continental climate, is beautiful. The prevailing winds are south-west and east. The river Moskva is frozen, on the average, for 143 days (from 12th November to 13th April).

Besides the Moskva and the Yauza, Moscow is watered also by the Neglinnaya, which now flows in an underground channel under the walls of the Kremlin. The city has about 200 ponds. The Moskva is crossed by five bridges, a branch of it, or rather a channel, makes an elongated island in the centre of the town. Water of excellent quality, principally from the Mytischi springs and ponds, 11 miles distant, is led to fountains in different parts of the town, whence it is taken by watermen. But this supply amounts only to 1,365,000 gallons a day, and the great mass of the inhabitants make use of the contaminated water of the Moskva and even of the Yauza, or of private wells.

The population of Moscow, which is steadily increasing, is estimated at 670,000; but no accurate census has not yet been made. In the middle of the 18th century it was estimated at only 150,000; in 1812, at 250,000 in summer and 400,000 in winter. In 1851 it was estimated probably much at the truth at 365,000. The inhabitants are mostly Great Russians, and only about 6000 are foreigners. They chiefly belong to the Greek Church or are nonconformists, the number of Lutherans and Catholics being only 8000 to 9000. The mortality is very great: in 1879 and 1880 it reached 37·9 and 41·8 per thousand, when 29·3 women died, and usually exceeds the birth-rate. Moscow, moreover, is often visited by epidemics which immensely increase the mortality, in consequence of the almost entire absence of sanitary regulations. Fires are very frequent; within ten years (1870-1879) they numbered 2192, the loss being estimated at £2,865,300.

Since the 14th century Moscow has been an important central city. Its merchants carried on a brisk trade with Novgorod and Pskov, with Lithuania, Poland, Hungary, Constantinople, Azoff, and Astrakhan. About the end of the 15th century princes transported to Moscow, Vladimir, and other Russian towns no fewer than 18,000 of the richest Novgorod merchant families, and took over the entire trade of that city, entering into direct relations with Narva and Livonia. The shops of the Gostinnyi Dvors of Moscow astonished foreign visitors in the 16th century by their large supply of foreign wares, and by the low prices at which the product of western Europe were sold,—a circumstance explained by the barter character of the trade. The annexation of Kazan and the conquest of Siberia gave a new impetus to Moscow, bringing it into direct commercial relations with Bokhara, and China, and supplying it with Siberian furs. The trade engrossed the minds of all European merchants in the 16th century, and an English company, "The Mystery," which received the monopoly of the Archangel trade, caused the latter to be sent by the White Sea instead of the Baltic. Moscow became the centre for nearly the whole trade of Russia, and Russians themselves engaged in large commercial operations. All the court, and the church too, were traders; and the poorest Moscow merchants participated in the trade through their corporations. Persians, Greeks, Armenians, Swedes, English, Germans, and Lithuanians had each its own Gostinoy Dvor (or caravanserai). Situated at the junction of six important highways (along which communication was maintained by special yamshiks), Moscow was the great storehouse and exchange mart for the merchandise of Europe and Asia. The opening of the port at St Petersburg affected its commercial interests unfavourably at first; but the Asiatic internal trade of Moscow has since then enormously increased, and at present it is the chief centre of railway traffic. The revenue of the custom house was in 1880 double that of St Petersburg (30,000,000 roubles as against 15,020,000 at St Petersburg and 9,000,000 at Warsaw). But the home traffic is the most important branch of Moscow trade. The city is the chief centre for the trade in corn, hemp, and in oil, sent to the Baltic ports, in tea, brought from Siberia and by St Petersburg; in sugar, refined there in large quantities; in grocery ware for the supply of more than half Russia and all Siberia; in tallow, skins, wool, metals, timber, woods, and all other produce of the manufactures of middle Russia. More than 10,000,000 cwts. of corn are annually brought to Moscow, half of which is sent to the Baltic ports. The yearly return of Moscow trade was estimated at 49,000,000 in 1848,—probably a half or a third of the real value, which is believed to have at least trebled since that time. The quantity of goods carried by railways from Moscow to St Petersburg, Yaroslavl, Ryazan, Kursk, and Brest, amounted in 1878 to 162,343,500 poods out of 635,740,000 for the whole of Russia; and the number of passengers was 8,637,890 (1,263,530 military) out of a total for Russia of 37,580,800 (civil and military) in that year.

From the 15th century onwards the villages around Moscow were renowned for the variety of small trades they carried on; large manufactures in cottons, woollen fabrics, silk, chintzes in Great Russia appeared at Moscow in the 17th century. After 1830, in consequence of protection factories and manufactories in the government of Moscow rapidly increased in number, and at present two thirds of them, or about 1000, chiefly producing articles to the value of upwards of £10,000,000 (the real production is probably much higher), are concentrated in the capital. There are at Moscow about 170 cotton-mills, 90 factories of woollens, and 70 of silks, the silk manufacture chiefly Caucasian, although a good deal is also imported from Persia; there are also upwards of 20 large tanneries, 50 leather factories, 15 large candle works, 70 larger workshops in making candles, 30 carriage manufactories, 20 watch factories.

The income and expenditure of Moscow in 1882 were respectively 4,921,097 and 6,121,663 roubles, as compared with 4,730,000 and 5,190,133 in 1881.

Moscow has many educational institutions and scientific societies. The university, founded in 1755, exercised a powerful influence on the intellectual life of Russia during the years 1830-1848, and it still continues to be the most frequented Russian university. In 1882 it had 2130 students and a teaching staff of 334; the students are mostly poor, the sum of 107,588 roubles having been granted in 1881 in scholarships to 854 of their number, and 11,000 roubles in the form of occasional assistance. The library contains about 200,000 volumes, and has rich collections in mineralogy, botany, and zoology. There is also an excellent higher technical school, and an agricultural college is situated in the Petrovskoye Park. Moscow has also a theological academy, a commercial academy, a school of topography, an institute (of Lazareff) for the study of Oriental languages, a musical conservatory, four institutes for women, a free university for women, seven colleges for boys, three for girls, three corps of military cadets, very many primary and technical schools, and many private schools.

still these are insufficient for the population, and the municipal schools every year refuse admission to about 1500 boys and girls.

The scientific societies are specially distinguished for their services in the exploration of the country. The following deserve particular mention:—the society of naturalists (founded in 1805), the society of Russian history and antiquities, which has published many remarkable works; the society of amateurs of Russian literature; the physical and medical society; the mathematical society; the society for the diffusion of useful books; the very active archæological society, founded in 1864; a society of gardening and of agriculture; several technical, artistic, and musical societies; and the very active young society of the friends of natural science, which already has published many useful volumes.

Among the museums of Moscow, the museum, formerly Rumantseff's, now connected with the so-called "public museum," occupies the first rank. It contains a library of 170,000 volumes and 3500 MSS., remarkable collections of old pictures, sculptures, and prints, as well as a rich mineralogical collection, and an ethnographical collection representing very accurately the various inhabitants of Russia. The historical museum has already been mentioned. The private museum of Prince Golitzyn contains a good collection of paintings and MSS., and great treasures of archæology are amassed in various private collections in Moscow and its suburbs.

The periodical press does not on the whole exercise great influence; twenty-five periodicals are published, besides the reports of the societies. But Moscow publishes a far greater number of books for primary instruction and of the humblest kind of literature and prints for the use of peasants than any other Russian city.

The philanthropic institutions are numerous, the first rank being occupied by the immense Foundling Hospital, erected in 1764. The hospitals, municipal, military, and private, are very large, but much below the standard of other capitals. The number of private philanthropic institutions is very considerable.

Though the drama was introduced into Russia at Kief, Moscow was the place of its development. The earliest representations were made at Moscow in 1610, and the first comedy (a translation of Molière's *Médecin Malgré Lui*) was played at the palace of Sophie, the sister of Peter I. It was only in 1759 that a theatre was erected. A large stone theatre was erected in 1776, and rebuilt in 1850 after a fire. It is for the Moscow stage that the best Russian dramas have been written, and it was in the Small theatre that the best Russian actors—Schepkin, Sadovsky, Samarsky, and Madame Vasiliefl—exhibited the comedies of Gogol, Griboyedoff and Ostrovsky.

Moscow, where the Great Russian tongue is spoken in its greatest purity, was the birthplace of the two chief Russian poets, Pushkin and Lermontoff, as well as of Griboyedoff, Ostrovsky, and Herzen. A monument to Pushkin was erected in 1880, on the Tverskoy boulevard. Griboyedoff, in his remarkable comedy *Gore at ouma*, has given a lively picture of the higher Moscow society at the beginning of this century, which continued to hold good until within the last few years. Its remarkable features in the unmistakable individuality of the Moscow type also maintain, in truth, although the physiognomy of Moscow has much changed since his day, it still has its special features that distinguish it from every other capital. The division of classes is much more felt at Moscow than elsewhere. The tendency towards originality, the love of grandiose undertakings, a kind of brag, together with little feeling of independence, a good deal of laziness, and much conviviality, still characterize the educated classes. The merchants live quite aloof from any political or even intellectual movement, under a rude patriarchal system, well described in the dramas of Ostrovsky. A large proportion of them are nonconformists. Their sons, the well-known kupecheskiye synki, "merchants' sons," when they leave this kind of life, astonish the capital with their extravagances and absurd display of wealth. But Moscow takes its present physiognomy chiefly from its busy lower classes. The streets are full of merchants and peasants, who continue to wear the old Russian garb, go on foot in the streets, drink tea in modest restaurants, and transact large business. From being a town of the aristocracy, Moscow is coming to be more and more a town of the wealthy merchant classes, who persist in keeping the low educational level of the peasants in the villages, and have but one aspiration, to become in their turn "merchants" of the type described by Ostrovsky.

Suburbs. Moscow is surrounded by beautiful parks and picturesque suburbs. Of the former one of the most frequented is Petrovsky Park, to the north-west. A little farther out is the Petrovsko-Razumovskoye estate, with an agricultural academy and its dependencies (botanical garden, experimental farm, &c.). Another large park and wood surround an imperial palace in the village of Ostankino. The private estates of Kuzminki, Ivanovo, and Kuntzevo are also surrounded by parks: the last has remains of a very old graveyard, supposed to belong to the pagan period. Twenty-eight miles westward from the city is the Savvin-Storogevsky monastery, situated, like so many other Russian monasteries, in a very fertile country, amidst beautiful forests; it has a pretty cathedral, a rich treasury, and library. Farther westward still is the New Jerusalem monastery erected by the patriarch Nikon.

In the south-west, on the right bank of the Moskva, which makes a great bend to the south, are the Vorobovy hills, which are accessible by steamer from Moscow, and afford one of the finest views of the capital. In the bend of the Moskva is situated the Novo-Dyevitchiy convent, erected in 1525, and connected with many events of Russian history. It is now the burial place of the Moscow aristocracy, and one of the richest nunneries in Russia. The village Arkhangelskoye has also a good park and a palace by Rastrelli. Ilyinskoye, formerly a private estate, was purchased by the imperial family in 1861.

In the south, on the road to Serpukhoff, is the village of Kolomenskoye, the residence of Alexis Mikhailovitch. The church built in 1531 is a striking monument of Russian architecture of the 16th century. Dyakovo has also a church built in the 17th century, presenting the architecture of the temple of Vasili Blajennoy. One of the best parts of the neighbourhood of Moscow is occupied by the park of Tsaritsino (11 miles from the Kursk railway station), purchased by Catherine II., with an unfinished palace and a beautiful park. The park of Nikolaevskoye, 12 miles from the city, between the Nikolaev and Ryazan railways, also occupies a beautiful site, and was created by Moscow merchants, to commemorate a holy picture. The Donskoy Monastery is said to have been founded before 1591 on the Moskva.

In the north, the forest of Sokolniki, covering 4 square miles, with its radial alleys and numerous summer residences, is the favourite Moscow resort frequented by the middle classes. Close by the east, and situated the Preobrajenskoye suburb, the seat of the nonconformists, and farther south the village of Izmailovo, home for invalids and a model farm for agriculture. The forest of Sokolniki is situated the wood of Measures, the favourite resort of the merchants and shopkeepers, who there spend large sums of money on shooting-matches.

History. The Russian annals first mention Moscow in 1147, as a place where Yuri Dolgoruki met with Svyatoslav of Seversk, his ally. The site was inhabited from a very remote period by the Merya and Mordvinian tribes, whose remains are numerous in the neighbourhood, and it was well peopled by Great-Russians in the 12th century. To the end of the 12th century Moscow formed a dependency of the principality of Vladimir, and had to suffer from the raids of the Mongols, who burned and plundered it in 1237 and 1293. It was only under the rule of Daniil, son of Alexander Nevsky (1261–1303), that the prince of Moscow began to play some important part in the wars of Russia with Lithuania. He annexed to his principality Kolomna, situated at the confluence of the Moskva with the Oka. His son and successor Yuri (1303–1325) annexed Pereyaslavl [illegible] next year Mojaisk [illegible] portion of the Moskva [illegible] month [illegible] inaugurated a policy which tended to centralize and consolidate the authority by patiently and other means of the neighbouring towns and villages. In 1339 the Kremlin, or fort, was [illegible] by a strong wall of earth and wood, offering a protection [illegible] materials from the Tver and Ryazan principalities went to extend the new city. Under John Kalita (1328–1341), the principality of Vladimir, where the prince and the metropolitan of Russia had taken refuge after that district's south-western Russia became united with Lithuania in 1320, the metropolitan Peter established his seat at Moscow, thus a new importance and powerful support to the principality. In 1367 the Kremlin was enclosed by stone walls, which proved strong enough to resist the Lithuanians in 1368 and 1370. The son and grandson of Kalita pursued the same policy. The latter, Dimitry Donskoy, [illegible] possessions of Starodub and Rostoff, and took part in the battle of Kulikovo (1380), where the Russians won the first time to oppose the Mongol in a great pitched battle. The church, which warmly supported the princes of Moscow, proclaimed the [illegible] victory to him and to the holy city of Moscow, [illegible].

At that time Moscow occupied a wide area covered with gardens. The Kremlin had three cathedrals, old [illegible], and dark, having narrow windows filled with mica plates, which [illegible] the plain wooden houses of the princes and boyars. Further out, on the second wall, the *posad*, or city, also [illegible] a wall of [illegible] an important centre for trade, [illegible] parts of the town belonged to different princes. In 1366 Moscow [illegible] supremacy. Two years after the battle of Kulikovo, it was taken and plundered (for the last time) by the Khan Tokhtamish.

The gradual increase of the principality continued during the first half of the 15th century, and at the death of Vasili the Blind, in 1462, it included not only the whole of what is now the government of Moscow, but also large parts of the present governments of Kaluga, Tula, Vladimir, Nijni Novgorod, Kostroma, Vyatka, Vologda, Yaroslav, and Tver. Still the princes of Moscow assumed, like several others, the title of Great Prince [illegible].

MOSELLE. See RHINE.

MOSER, Johann Jakob (1701-1785), jurist, was
at Stuttgart on 18th January 1701. He studied a
university of Tubingen, where, at the early age of nine
he became professor extraordinarius of law. A year
he resigned his chair, with the expectation of receiving
appointment at Vienna, but this was refused him on
declining to join the Catholic Church. From 172
for some years held an ordinary professorship of la
Tubingen, and in 1736 he accepted a chair and directo
in the university of Frankfort on the Oder. On acco
however, of differences with King William I. of Pr
he resigned these in 1739 and retired to Ebersdorf, a vi
the principality of Reuss, where for several yea
devoted himself wholly to study, and especially to
prosecution of his *Deutsches Staatsrecht*. In 1751 he
called back to Wurtemberg as "landschaftsconsul
and in 1759 was imprisoned at Hohentwiel on accoun
the steps he had taken in connexion with this office ag
certain tyrannical proceedings of the duke. In 176
received his liberty and was restored to office, but
that time took little part in political affairs. He died
September 1785.

Moser was the first to discuss in an adequate form the subj
European international law, and he is the most voluminous G
writer on public law In all, he wrote more than 500 vol
his principal works being *Deutsches Staatsrecht*, 1737-1754;
Deutsches Staatsrecht, 1766-1775; *Deutsches Staatsarchiv*, 1751-
Grundriss der heutigen Staatsverfassung von Deutschland,
See Schmid, *Das Leben J. J. Moser's*, 1868; Schulze, *J. J.*
der Lehre des Deutschen Staatsrechts, 1869.

MOSES. Of the life of Moses we have few e
details, though the history of Israel bears witness to
importance of his work. To what has been said
ISRAEL there will here be added a brief summary of
has been handed down about him. His origin and
history of his childhood can be read in Exod. i., ii. (
vi. 16 *sq.*); the statements there given are enlarged
modified in the Jewish Midrash, particularly as we f
in Josephus and Philo.[1] The daughter of Pharaoh, w
told, was called Thermutis (*Ant.*, ii. 9, 5), or Merris (E

[1] In still more fantastic form in the Palestinian Targum on E
the details of which need not be repeated here.

Præp. Ev., ix. 27); she named the boy Μωσῆς, not because she used the Hebrew verb משה to express the fact that he was drawn out of the water, but because the Egyptian word for water was *mo*, and *eus* applies to those who have been delivered from it (*Ant.*, ii. 9, 6; comp. Philo, ed. Mangey, ii. 83, Euseb., *l.c.*, ix. 28). She took care to have him trained in all the wisdom of the Egyptians (Acts vii. 22) and in that of the Greeks, Assyrians, and Chaldeans as well (Philo, ii. 84). To his great intellectual endowments corresponded his personal beauty, of which Josephus speaks in extravagant terms (*Ant.*, ii. 9, 6 7). It was on account of this beauty that, when on one occasion, as a young man, he led an Egyptian army against Meroe, the Ethiopian princess Tharbis opened the gates of the capital to him in order to make him her husband (*Ant.*, ii. 10, comp. Numb. xii. 1).

For reasons explained in Exod. ii. 11 *sq.*, Moses left the land of Pharaoh and came to Midian to the Kenite priest Jethro (also called Hobab Ben Reuel and Reguel), whose daughter Zipporah he married, becoming by her the father of two sons, Gershom and Eliezer (Exod. ii. 21 *sq.*, xviii. 2 *sq.*). During his stay in Midian he received, at the foot of Sinai (Horeb), the divine revelation at the burning bush, by which he was called to become the liberator of Israel from Egyptian bondage. With much reluctance he at last accepted this vocation, and, already expected by his brother Aaron and the elders, returned to his people. Arrived in Egypt, he associated Aaron with him as his interpreter, being himself no orator, but a man of deed and action, and appeared before Pharaoh to demand in the king of Jehovah's name permission for the people to go with flocks and herds into the wilderness to celebrate there a festival (the spring festival of the Passover) in honour of their God. Jehovah gave emphasis to the demand by great signs and wonders, the plagues of Egypt, which have their explanation for the most part in evil to which Egypt is periodically liable, but are treated by Israelite tradition as the weapons of Jehovah in his ever-intensifying conflict with the king and the gods of Egypt. At length, by the slaying of the first born, the stubbornness of Pharaoh was broken, so that he consented to, and even urged, the departure of the Hebrews. By and by, however, he changed his mind and, setting out in pursuit of the Hebrews, overtook them at the Red Sea; but Jehovah fought for them, and annihilated Pharaoh's chariots and all his host. In order to present themselves in proper festal array at the celebration for the sake of which they were gone into the wilderness, the Hebrew women had borrowed dresses and ornaments from those of Egypt; the Egyptians could now only blame themselves and their hostile conduct if these articles were not returned.[1]

By the miracle wrought at the Red Sea Moses was pointed out to the Hebrews as the man of God to whom accordingly they now committed the task of caring for their outward life as well as their spiritual guidance. He led them first to Sinai, where the law was revealed and the worship in connexion with the ark of the covenant instituted. When he had communed face to face with the Godhead for forty days on the holy mountain, the skin of his face shone so that he had to wear a veil (the horns, properly rays, on his forehead). Driven from Sinai in consequence of their worship of the golden calf, the Israelites removed to Kadesh with the view of entering Palestine. But this plan was defeated by their unbelief and faintheartedness, and, as a punishment, they were compelled to sojourn forty years in the wilderness of Kadesh (Peran, Sin). It was here and now that the people went to school with Moses, here, at the sanctuary of the cloud, he declared law and judgement; and here, according to the view of the oldest tradition, the foundations of the Torah were laid (Exod. xviii.). The region of Kadesh was also the scene of almost all the miracles and other remarkable occurrences we read about Moses. Here he showed himself to be at once the father and mother of the people, the judge, priest, and seer. It was not till towards the close of his life that he led the Israelites from Kadesh northern Moab, which he wrested from the Amorite king Sihon of Heshbon. Here he died on Mount Pisgah, Nebo, after taking leave of the people in the great farewell address of Deuteronomy. According to Deuteronomy xxxiv. 6, he "was buried in a valley in the land of Moab . . . but no man knoweth of his sepulchre unto this day." After the death of the leader, hero, Moses had named Joshua ben Nun, but the real heir to his position and influence were the people at the sanctuary of the ark of the covenant.

On his personal character the Bible tells us nothing, except in Numbers xii. 3 where only a heavily burdened passage in later Judaism is all the more at liberty on this account to speculate upon it (see especially Josephus, *Ant.*, iv. 8, such incidents as are the account of Moses' position in the [illegible] and the Miracle [illegible] to the [illegible] of the state of Horeb [illegible] prevailed even in the *Contra Apion* of Josephus. The [illegible] Hebrew [illegible] authority to accept and put [illegible] rules to the Hebrew [illegible] time merely [illegible] upon obscure [illegible] the [illegible] them upon the [illegible] travellers with hatred and not with love, and then seek their welfare [illegible] the Egyptian history and chron[illegible] known [illegible] [illegible] [illegible] and persons [illegible] [illegible] and he like cannot be [illegible] [illegible] [illegible]

e find other notices of this celebrated man,[1]—such as, nat he was the nephew of Mesrob, that he was publicly omplimented by the emperor Marcian, that he had been rdained bishop of Bagrewand by the patriarch Giut, and nat he was buried in the church of the Apostolic Cloister t Mush in the district of Taron; but these accounts must e received with great caution. This remark applies pecially to the statement of Thomas Ardsruni,[2] that loses, like his Hebrew prototype, lived to the age of 120 ear, and recorded his own death in a fourth book of his reat work.[3] The same caution must be extended to nother tradition, based on an arbitrary construction of a assage in Samuel of Ani,[4] which places his death in the ar 489.

Of the works of Moses[5] the best known is the *History f Armenia*,[6] or, as the more exact title runs, the *Genealogical Account of Great Armenia*. It consists of three books, nd reaches down to the death of Saint Mesrob, in the econd year of Jazdegerd II. (17th February 440).[7] It is edicated to Sahak Bagratuni (who was afterwards chosen o lead the revolted Armenians in the year 481), as the an under whose auspices the work had been undertaken. his work, which in course of time acquired canonical uthority among the Armenians, is partly compiled from ources which we yet possess, viz., the *Life of Saint Gregory* y Agathangelos, the Armenian translation of the Syriac *octrine of the Apostle Addai*, the *Antiquities* and the *ewish War* of Josephus, and above all the *History of Mar bas Katina* (still preserved in the extract from the book f Sebêos),[8] who, however, did not write, as Moses alleges, Syriac and Greek, at Nisibis, about 131 B.C., but was a ative of Medsarich, and wrote in Syriac alone about 383 .D., or shortly thereafter. Besides these, Moses refers to whole array of Greek authorities, which were known to im from his constant use of Eusebius, but which cannot ossibly have related all that he makes them relate.[9] lthough Moses assumes on that he is going to rely entirely pon Greek authors, the contents of his work show that it s mainly drawn from native sources. He is chiefly indebted o the popular ballads and legends of Armenia, and it is o the use of such materials that the work owes its permaent value. Its importance for the history of religion and ythology is, in truth, very considerable, a fact which has the great merit of Emin[10] and Dulaurier[11] to have first ointed out. For political history, on the other hand, it s of much less value than was formerly assumed. In articular, it is not a history of the people or of the ountry, but a history of the Armenian aristocracy, and, in opposition to the Mamikonian tendency which pervades rest of the older Armenian historical literature, it is in the interest of the rival Bagratunians. Down to century II. is proved by the contemporary Graeco annals to be utterly untrustworthy; but even for the of Armenian Christianity it must be used far cautiously than has been done, for example, by The worst feature is the confusion in the chronology, strange to say, is most hopeless in treating of the temporaries of Moses himself. What can be thought writer who assigns to Jazdegerd I. (399-420) the years of his predecessor Bahrâm IV., and the two years of Jazdegerd I. to his successor Bahrâm V. (420 The present writer[12] formerly attempted to explain unhistorical character of the narrative from a te arising out of the peculiar ecclesiastical and politi cumstances of Armenia, situated as it was betwe eastern Roman and the Persian empires, enemies which were substantially the same in the 5th as the in the two following centuries. In the course of investigations, however, he has come to the con that, besides the many false statements which M Khor'ni makes about his authorities, he gives account of himself. That is to say, the author *History of Armenia* is not the venerable translator 5th century, but some Armenian writing under hi during the years between 634 and 642. The p furnished on the one hand by the geographical and graphical nomenclature of a later period[13] and anachronisms,[14] which run through the whole book often closely incorporated with the narrative itself, the other hand by the identity of the author of the with that of the *Geography*, a point on which all excluded by a number of individual affinities,[15] not of the similarity in geographical terminology. The decision as to the authorship of the *Geography* se question for the *History* also.

The *Geography* is a meagre sketch based mainly on t *geography* of Ptolemy of Alexandria on the end of the 4th and indirectly on the work of Ptolemy. Only Armenia, th empire, and the neighbouring regions of the East are indep described from local information, and on these sections of the little work depends. Since the last published text[16] name-lists "Russia" and "Greece," Saint Martin has deemed that it was written by Moses, and as dated its orig 10th century. It was shown, however, by J. Indjidjea the same interpolations, which are not found in better ma And in fact it is quite evident that a book which gives the of the Sasanid empire into four spahbedships in pure old names cannot possibly have been composed at a long inter the time of the Sasanidæ. But of course it is equally e such a book cannot be a genuine work of Moses of Kho that division of the empire dates from the early part of of king Chosrau I. (531-579).[18] Accordingly the latest e P. Patkanow,[19] to whom we are indebted for the best te

phy, is of opinion that we have in it a writing of the 7th
y. In this judgment we must concur; and, if the limit
which the *Geography* was composed are to be more nearly
d, we may say that, from isolated traces of Arab rule (which
menia dates from 651), it must have been written certainly
hat year, and perhaps about the year 657.

other extant work of Moses is a *Manual of Rhetoric*, in ten
, dedicated to his pupil Theodorus. It is drawn up after
models, in the taste of the rhetoric and sophistry of the later
ial period. The examples are taken from Hermogenes, Theon,
nomius, and Libanius, although the author is also acquainted
ost writings, *e.g.*, the *Phaedo*, of Euripides. On account of
vergence of its style from that of the *History of Armenia*,
nian scholars[3] have hesitated to ascribe the *Rhetoric* to Moses
or'ni; but, from what has been said above, this is rather to
garded as a proof of its authenticity.

OSHEIM, JOHANN LORENZ VON (*c.* 1694–1755), well
n as a church historian, but also distinguished in his
as a master of eloquence, was born at Lübeck on the
f October. There is some uncertainty as to the year,
the probability is in favour of 1693 or 1694. He
ved a somewhat irregular education at the gymnasium
s native place, and afterwards entered the university
iel, where he took his master's degree in 1718. His
appearance in the field of literature was in a polemical
gainst Toland, *Vindiciae antiquae Christianorum disci*
ae (1720), which was soon followed by a volume of
rationes sacrae (1721). These works, along with the
tation he had acquired as a lecturer on philosophy,
also as a fervent and eloquent preacher while acting
sistant to Albrecht zum Felde, his teacher and future
r-in-law, secured for him a call to a theological chair
elmstadt, in 1723. The *Institutionum Historiae Eccle*
ex libri IV. appeared in 1726 (2 vols., 12mo), and
e same year he was appointed by the duke of Brunsw
abbot of Marienthal, to which dignity and emolu-
the abbacy of Michaelstein was added in the following
Mosheim was much consulted by the authorities
the new university of Göttingen was being formed;
ially had he to do with the framing of the statutes
he theological faculty, and with the provisions for
ng the theologians independent of the ecclesiastical
s. But having signed in 1726 a promise to remain
Helmstadt he was unable to accept the call to the
gia Augusta which was urgently pressed upon him,
the year 1747, when the duke of Brunswick at last
sed him from his obligation. To enhance the dignity
ready possessed as a learned and brilliant theological
ssor at Göttingen, a new office was specially created
im, that of chancellor, which, however, proved too
burdensome, exciting the jealousy of the professors whom
overned. He died at Göttingen on 9th September
1755, shortly after the completion of a new and
improved edition of his *Church History*.

For Mosheim's place as an ecclesiastical historian, see
History, vol. v. p. 765. In this department of literat
addition to the *Institutiones* must be specially mentioned
Rebus Christianorum ante Constantinum Magnum Comm
(1753), and Gibbon's just criticism. "Less profound than P
less independent than Le Clerc, less ingenuous than Beauso
historian Mosheim is full, rational, correct, and moderate
exegetical writings, characterized by learning and good

sermons (*Heilige Reden*) considerable eloquence is shown
mastery of style which justifies the position he held as pres
the German Society. There are two English versions of th
Ecclesiastical History, that of Maclaine, published in 1764, and that of M
(1850), which is much more correct. The latter was revi
re-edited by Reid in 1818. An English translation of the *I*
Christianorum, begun in 1813 by Vidal, was completed and
by Murdock in 1841.

MOSQUE (*Jámi'*, or more fully *Masjid Jámi'*, th
of congregational prayer). Owing to the almost co
absence of ritual in the Moslem worship, the mosq
least in its earlier forms, is one of the simplest of
ligious buildings, its normal arrangement being a
court (*Sahn*) surrounded by a covered cloister (*Liw*
the centre of which is a cistern for the ablution re
before prayer (*Midha'a*); the side of the mosque w
towards Mecca is occupied by a roofed building (*Ma*
or place reserved for prayer, sometimes screened off
the court, but frequently quite open towards it.
centre of this sanctuary is a niche (*Mihrab* or
showing the direction of Mecca, and by the side
niche is a lofty pulpit (*Minbar*). In front of the pu
a raised platform (*Dikka*) from which certain sho
are chanted, and near it one or more seats and l
combined from which chapters of the Koran are r
the people.

Minarets (*Manárát*, sing. *Manára*) were not
during the first half century after the Flight, but
a rule no mosque is without at least one. From the
gallery of the *Minárat* announces to the f
the times for prayer, five times during the day, and
at night. Blind men are generally selected for this
so that they may not overlook the neighbouring ho

Most mosques have endowed property, which is
nistered by a warden (*Nazir*), who also appoints the
and other officials. The larger mosques have two i

the other, the *Imám*, reads the Koran, and recites t
daily prayers, standing close to the *Mihrab*, and
the congregation, who repeat the prayers with hi
closely follow his postures. The muezzins do not
priestly sect; they generally have other occupation
as teachers in a school or keeping a shop, and may
time be dismissed by the warden, in which case th
the title of imám. Doorkeepers and attendants, to
the floor, trim the lamps, and perform other menial
are attached to each mosque, in numbers varying acc
to its size and endowment. Moslem women, as a r
expected to say their prayers at home, but in so
mosques they are admitted to one part specially s
off for them. Thus is the case in the mosque o
Zaínab in Cairo. In the Aksa mosque at Jerusalem
is a latticed balcony for the women, who can see
being visible to the male worshippers below.

The greatest possible splendour both of materi
workmanship is often lavished on the building a

[3] The passage about the trade of Basrah, which was founded in 636, is decisive on this point (Saint Martin's edition, ii. p. 368).
The peculiar interest which the author (Saint Martin, ii. p. 340) takes in the origin of the Slavs in Thrace may be explained by the war that them which called the emperor Constans II. away from the in the year 657. In other respects the writer displays the most ete indifference, and even ignorance, with regard to the state of in the West.
f. Langlois, ii. 49.

[4] Cf. Langlois, *l.c.*

[5] In mosques frequented by Turks or other members of th sect running water is provided from a raised tank with flow called a *fawwárah* after the sect who require it. Other Mo content to wash in a stagnant tank.

ings. The whole outside is frequently decorated with most elaborate surface-carving in stone or marble,—the rement of the richest marbles, inlaid in intricate patterns. walls panelled in a similar way, or decorated with most minute mosaics of glass, mother of pearl, agates l other costly stones. The central niche and the pulpit of special magnificence; and, if the latter is of wood, s often covered with delicate ivory carvings, and inlay pearl and ebony. Very beautiful surface ornament, cuted in hard stucco, and enriched with gold and colours, ed to decorate arches, wall surfaces, and the pendentes of domes, which latter generally have the so-called adactite" form of ornament—one of great beauty and plexity. The woodwork of doors, screens, and ceilings, frequently very gorgeous with carving, inlay, and elaate painting, the whole of the doors outside are often ered with very delicate pierced and embossed work in nze, or more rarely iron. The magnificent tiles from sia, Damascus, and Rhodes (enamelled in brilliant blue, en, and red, on a white ground, are often used to cover wall. Decorated windows in pierced marble or stucco k often occur, these are filled with brilliant coloured , always in very small pieces, forming a translucent ic of jewel-like richness. Lamps of enamelled glass, of bronze inlaid with silver, were once common, but are rapidly disappearing.

some mosques, specially the Karuba mosque at Fez in rocco, possess a collection of magnificent illuminated SS., chiefly copies of the Koran and other religious books; the large collection at Fez, MSS. of Aristotle's *Natural story*, with the works of Averroes and other commentaors, exist in considerable number; some few of the MSS as early as the 10th century.

Plans of Mosques. Considerable diversities exist in the n and arrangement of mosques in various countries, either use the Moslem conquerors adopted to some extent existing buildings and architecture of the conquered ple, or on account of the new mosque being built on a already cramped by surrounding buildings. The first these causes influenced to some extent the mosques of ia, and to a much greater extent those of European key. The second cause, the cramped site, especially Cairo, created a special type of plan. Nevertheless, en free from such disturbing influences, there is one mal plan adopted, at least in early times, by the Mos in all countries from India to Cordova, and from thern Syria to Egypt.[1] This normal plan is a very ple one, and is the natural product of a country like bia, unskilled in architecture, where land was worth little, and timber very scarce. (See fig. 1.)

hough not the earliest the great mosque of Cordova is the most nificent, and in its main the best preserved, of this typical s.[2] It was begun in 786 A.D. by the caliph Abd al Rahman I Sheraine and completed by his son Hisham in 796 A.D. though it afterwards altered and there to some extent ruined by additions the work of the Christians, who made it into a cathedral it still remains but little altered, except by the loss of its magnicent carved and inlaid wood ceiling and sumptuous *Mimbar*, or t omitting recent additions of two main parts, a large ed open court, with at one side a covered building for yer. In one respect only it differs from the usual plan the n court is generally much larger than the roofed space, whereas Cordova it is smaller. For the sake of brevity this arrangeit will in the rest of the article be referred to as the "normal n." In spite of neglect and alterations this mosque is still one the most imposing buildings in the world. The long ranges of

[1] See Coste, *Architecture Arabe*, 1837-39; Bourgoin, *Les Arts bes*, 1865; Prisse d'Avennes, *Art Arabe*, 1874-80; and Texier, *Asie Mineure et la Perse*, 1842-52.

Contreras, *Arte Arabe en España*, 1875; *Academy*, 19th Novem 1881, "Mosque of Cordoba," by J. H. Middleton; *Mon. Iglesia de ería*; and Pougery, *Mosquée de Cordoue*.

aisles, nineteen from east to west and thirty-one from no south—on their marble columns the spoils of many a Gre Roman temple—seem to stretch almost endlessly in every dir and each range of pillars appears to lose itself in the gl distance, so that from no point can any idea be formed of the real size of the whole building. The side towards the was quite open, and all over the court orange-trees were p at regular intervals, continuing the lines of the columns and set at the same distances apart; so that aisles of orang in long ranges covered the open space, just as the marble co did within. No words can describe the jewel-like splendour mosaics in the sanctuary, which in complicated Arabesque pa mixed with elaborate Cufic inscriptions, cover the walls and ev arches, which cross and recross each other in the most fanci during way, forming a sort of aisle round three sides of the sanc There is documentary evidence to show that these glass m though of thoroughly Oriental design, are, like those in the m of Jerusalem and Damascus, the work of Christian artist By antrum

The most important early mosques were all built on this plan, with but very slight variations. The following are s the finest examples of this type:

Mosque of 'Amr, Old Cairo, begun in 642 A.D., but m lished at the end of the 7th century, and afterwards rebuilt (see fig. 1).

Mosque of Sidi Okba at Kairawan in Tunis, latter part 8th century.

Mosque of Sidi Okba near Biskra in Algeria, about 684.

Mosque of Karuba at Fez in Morocco, end of 8th century.

Great mosque of Damascus, 708.

Great mosque of Cordova, 784-791 (described above).

Mosque of Ibn Tulun, Cairo, 879.

Mosque of Al Azhar, Cairo, begun about 970.

Great mosque at Old Delhi, 1196-1235.

Two first of these, the mosque of 'Amr (see Coste, *Archi*

Mosque-tomb of Sultan Kait Bey, Cairo

1. Main entrance. 2. Lobby and entrance to dromos. 3. Great mosque. 4. Lofty arched doorway. 5. Kibla. 6. Mausoleum of Sultan Kait Bey. 7. The tomb of Dukka

nt by the sultan, [illegible] very beautiful, and re[illegible] for it[illegible]ving an

id be observed that the nt mosques of Egypt, r even more owe little to the native genius of the Arab the[illegible] their own buildings at the Prophet were t and indeed de[illegible] they were always ready of the architectural construction power of the[illegible] conquered

ber buildings of Egypt y the product of Coptic ntum-skill, while rather rt of Persia, both in tile-stems and details of ship, exerted a para fluence over the whole world. Another influ not be forgotten, that and English Gothic, by the sublime erected [illegible]-order during the [illegible] of Palestine. One of the [illegible] that of Kairoan [illegible] a late arched doorway [illegible] in a Christian church [illegible] in the province of Barn

work, which would not be out of place in Salisbury Cathe[illegible]-like translation of the cinquefoil pumbshaft and deep [illegible]dings of the Lake of Tiberias in

t of northern Africa contain many mosques of great [illegible] dant among these the most important, in addition to those [illegible]entioned as having the normal plan, are [illegible] the mosque Abdallah's Wadi-en-Kairawan in Tunis, a very large build[illegible]ramme over a court and cloisters dating from the same od as the other great mosque in Kairawan, its minaret [illegible]ut-side with fine blue and green tiles. To the great mosques [illegible] 10th century and to that of Tlemcen, in the extreme [illegible]lgeria, built in the middle of the 14th century, the [illegible] nded pavement, partly composed of Algerian onyx, and a bronze chandelier, 8 feet in diameter, given by Sultan [illegible], 1248-81.

[illegible]n, at Zahra near Cordova, was one of the grandest of [illegible] mosques, built in 941, but nothing of it now exist[illegible] churches in Spain were originally built as mosques, such [illegible] de la Luz at Toledo, a small, nearly square building, [illegible] dome like a baldaquin on marble pillars.

[illegible]ut but little now remains of the magnificent early mosques [illegible] such splendour, especially during the reign of Hak[illegible]

At Erzeroum there is a fine mosque, combined with tom[illegible]ital, almost Early Gothic in style, dating from the 13th [illegible]. At Diarbekr there is another church-like mosque, evidently [illegible] of Byzantine builders, according to Texier, this belonging to the [illegible]ury, but it is probably two or three hundred years earlier [illegible]esque of Hosein, near Cairo; in Cilicia is a fine large [illegible]n building, covered with low domes on square piers. It [illegible]n the second half of the 12th century.

[illegible]kinghe near Brousa is a very remarkable mosque that [illegible], built in the 13th century almost in the style of con[illegible], Italian Gothic. Its main facade bears an extraordinary [illegible]se to some of the earlier Stone palaces.

[illegible]ter capital of Persia, Ispahan became the centre of the [illegible]evelopment of the Persian arts under Shah 'Abbas I., [illegible] to the period belong the splendid mosque called [illegible]ch a domed planned building of great size, enriched [illegible]t's-raphesque arcades and out, by wall-coverings of [illegible] Persian encaustic tile. The mosque of Sultan Hosein, [illegible]et in 1730 preserves much of the old beauty of design [illegible]ration.

[illegible]ese specimens of [illegible] mosque of great size and beauty. The [illegible]es are most influenced by the still older Hindu architec[illegible]l; one of the larger mosques are built of materials from [illegible]Jain temple. It is recorded that twenty-seven Hindu [illegible]were destroyed to build the great mosque in Old Delhi [illegible]1196 to 1245, which presents a curious mixture of the [illegible]Saracenic Hindu, carved work with the more refined and [illegible]decoration of the Moslem builder. This great mosque is [illegible]ormal plan [illegible] the 13th century mosque at Ajmir, also

[illegible]Texier, *L'Arménie et la Perse*, 1842-52; Coste, *Monuments [illegible] de la Perse*, 1867; Flandin and Coste, *Voyage en Perse*,

built on the ruins of a Hindu temple. A whole volume would no[illegible]-cessary to describe the magnificent mosques of India, such as those at Ahmedabad, Mandu, Malwa, Jaunpur, Lahore, Agra, and countless others. The introduction in the 17th century of Florentine marble and mosaic workers produced a new and very splendid style of building, of which the Pearl mosque and the Taj Mahal at Agra are the finest specimens.

At Srinagar in Kashmir there is a large and very [illegible]mosque of the normal plan, constructed entirely of wood [illegible] with numerous pillars of deodar pine. It was built by Sikh [illegible] and is an extremely picturesque building. (See Cole, *Ancient Buildings in Kashmir*, 1869.)

In Turkey the mosques are rather old Christian churches, [illegible] as S. Sophia and S. Saviour's at Constantinople, and the [illegible] fine early churches of Thessalonica and Trebizond or [illegible] more copies made to accommodate the Ottoman splendid [illegible] of S. Sophia, a building which seems to have been [illegible] admired and appreciated by the Ottoman conquerors. [illegible] mosque of Solaiman the Magnificent, 1550-1555, is the finest [illegible] rather a reproduction of S. Sophia. Another, rather later, [illegible] the mosque of Sultan Ahmed, 1608. None of these [illegible] of course earlier than the middle of the 16th century.

In the present century Moslem art has practically [illegible] architectural importance. The great mosque of Mehemet Ali [illegible] the citadel of Cairo is the work of a German architect, and [illegible] built of rich materials of small artistic value or [illegible] but feebly designed building of the S. Sophia type. Unfortunately European influence seems now to be [illegible] the feeling for [illegible] that still survive among Moslem [illegible] *Jerusalem*, [illegible] works referred to are [illegible], Murphy, *Arabian Antiquities of Spain*, [illegible]; Jones, *Alhambra*, [illegible]; *Architectural Studies at Granada*, [illegible]; Cole, Robert, *Holy Land and Egypt*, &c., 1874; [illegible] *Saracenic Architecture*; Cadet de Gassicourt, *Recueil de Dessins [illegible]*; Hittorff, *Architecture moderne de la Sicile*, Stuttgart, 1835; [illegible] *Architecture of Egypt*; Lewis, *Illustrations of Constantinople*; [illegible] *Jerusalem*; [illegible] *Jaffa*.

MOSQUITO[1] (sometimes written "Mosquetto," Spanish word signifying "little fly," is a name popularly applied to certain annoying dipterous insects, and, strictly speaking, it should probably be used only for species of *Culex* proper and for the genus *Culex* in particular, for which genus it is the English synonym, but in many countries it is [illegible] almost common consent applied to all small dipterous [illegible] insects that suck human blood, and therefore in that [illegible] we know as "gnats" and flies," "midges," &c., of the genera *Corethrosoma*, *Simulium*, and others. By English [illegible] distinction is often falsely drawn between "mosquitoes" and "gnats," the former being supposed to represent a [illegible] insect native chiefly of hot climates, whereas the latter [illegible] is their own too well known pest. In effect the [illegible] really synonymous, and any actual difference can only [illegible] specific. In very hot seasons we not unfrequently [illegible] alarming reports of mosquitoes having made their appearance in London and elsewhere in the British [illegible] means whereby they were imported are often suggested, the real facts of the case being that extra heat may render the native species more annoying, or that it causes a [illegible] condition in which their bites are more severely felt. The "mosquitoes" of high northern latitudes may be species both of *Culex* and *Simulium*.

Accounts of the numbers of these insects in tropical countries and in high latitudes, and of their irritating attacks, are to be met with seldom exaggerated in most books of travel. Even in Britain the annoyance caused by gnats is very great, and in marshy districts often unendurable, especially to new comers, for it seems probable that the insects really attack a visitor more furiously than they do the natives of the district, but, on the other hand, the latter may be more indifferent to their assault. In some subjects even the "piping" by which a hungry gnat announces its presence has most distressing effects.[2]

[1] Texier and Pullan, *Byzantine Churches*, 1861; Paspates, *Les [illegible] de Constantinople*, 1852.

[2] A few years ago a London hotel, popular with Americans, [illegible] was said to harbour mosquitoes, and some of the visitors had brought with them from the Southern States. An examination revealed the fact that the cistern was uncovered and exposed, and was the breeding-place for hosts of gnats.

h latitudes they are driven off by anointing the body h fish oil, and in hot climates "mosquito curtains" are t of the ordinary bed furniture. It is only the female t bites, and even of her but a very small proportion of them t can ever taste human blood or that of any warm blooded nal, blood would not appear to be essential to their wel . It has been suggested that warm blood may have influence on the ova, but it cannot be supposed that eggs of those multitudes of individual that never get a nce to taste blood are necessarily infertile, everything ls to prove the opposite.

Of late mosquitoes have been accused of playing a nefarious but protected part in the dissemination of certain ozoic diseases. According to the researches of Dr. on and Cobbold and others, it appears certain that insects in sucking the blood of persons who are hot the entozoon known as *Filaria sanguinis hominis* take e parasites into their own system and it is believed they afterwards die their death and otherwise contaminate drinking water with them, and thus convey the ozoa into the blood of persons previously unaffected. e spirifer are aquatic in their early stage. The

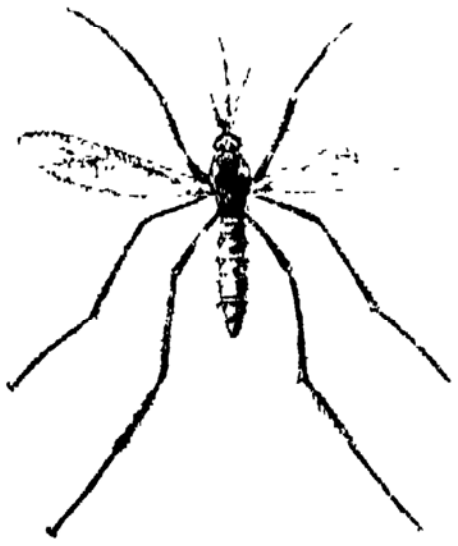

Fig. 1.—Mosquito (*Culex pipiens*).

ale deposits her eggs in boat-shaped masses on the ace of the water. The larvæ are very active, and have

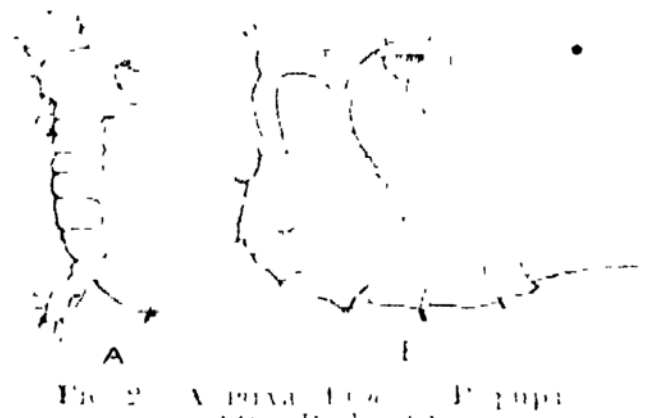

Fig. 2.—A, Larva; B, Pupa. (After Packard.)

the cutter perking mo ; the last segment furnished with a iratory apparatus, form of which pro ly varies according he species, but it nally a long tube, extremity of which be exposed to the rnatant. The pupæ also active (contrary to the condition in most dipterous ae), and are odd looking creatures owing to the great elopment of the thoracic region, the respiratory ap atus is in the thorax in this state, the extremity of the having two swimming-plates, the pupæ do not eat, their activity is very great.

o notice of the mosquito or gnat would be complete without an anation of the mouth-parts by which it is enabled to cause extreme irritation. When these parts are erected in sucking other the whole looks like a long proboscis, but in reality it sists of seven distinct slender pieces separately attached to the base: labium, two maxillæ, two mandibles, the lingua and hy um. The nomenclature of the mouth parts varies with different ors. G. Dimmock (*Anatomy of the Mouth-parts and Sucking apparatus of some Diptera*), the latest investigator of this plex apparatus, states that the labium has for its function for the part, the protection of the fine setæ which form the pierc ing organ of *Culex*. In the female of *Culex* the proboscis th is formed by the labium alone. When the mosquito has d a place which suits it for piercing (for it often tries different es on our skin before deciding on one), it plants itself lightly y upon the spot, and a moment later the labium is seen to be

Fig. 3.—Mouth-parts of female mosquito.

of the labrum, for about one-third of its length from the tip, and they are pushed into the tissues of the upper side of the fore-labrum, above the two pairs of the fibrillæ pressed firmly upon the skin. The extraction of blood is effected by means of a pumping apparatus at the mouth parts. As the latter appear to be incapable to detect a person's hand, it has been considered that irritation caused by the bite of a mosquito could be prevented by the use of some substance which would be recognized by the insect as disagreeable to be commonly accepted. Darwin proved that the secretion of a person's skin. In the mosquito the mouth parts vary considerably from those of the bee, the most important difference being that in the latter the maxillæ are absent and the mandibles are developed.

About 30 species of *Culex* are scattered over Europe, North America, Europe and about 1 of from the species of the but their distribution is not well known, but differences in many cases it is probable that the number of species is very much less. Aristotle appears to have known the mosquito, but there is not any proof that Pliny described more than one species, the former from a popular point of view, and the latter from a scientific point of view, there are differences between the

MOSQUITO COAST. See NICARAGUA.

MOSSES, or MUSCI, one of the two divisions of botanical *Bryophyta*, which includes also the liverwort or *Hepaticæ*. See MUSCINEÆ.

MOSSLEY, a manufacturing town of Lancashire, England, situated on the London and North Western Railway and on the Huddersfield canal, near the west bank of the Tame, which here separates Lancashire from Cheshire, 3 miles north-east of Ashton-under-Lyne, 6 miles north-east of Manchester. The houses are for the most part built of stone. To supersede the old chapel of ease, erected in 1757, a new building was begun in 1855. A mechanics' institute was erected in 1858. In the vicinity of the town an eminence called Hart head Pike or Hartshead is a lofty circular tower surmounted by a square stone in 1758. Mossley has risen into importance since the introduction of the cotton manufacture about 1820. Woollen is largely manufactured. The town was made a local board district in 1852, and was constituted a municipal borough in 1864, the district of which it is composed including also part of Saddleworth in Yorkshire. The total population was in 1861, 10,578, and 13,572 in 1881.

MOSTAR, the chief town of Herzegovina, is built on both banks of the Narenta about 3 miles from its mouth and 10 miles south-west of Serajevo (Bosna-serai), the capital of Bosnia. Among the public buildings are a palace, two Greek churches and forty mosques, many of which are with Roman or Byzantine tracery in their windows. The fine old bridge from which the town takes its

[illegible] Old Bridge is probably Roman The town [illegible] of trade and manufactures excellent Damascene and the grapes and wine of Mostar are celebrated [illegible] the south Slavonic countries The population, [illegible] had increased to 10,818 by 1879

[illegible] ancient name was Salonæum Sat extreme, or An[illegible] little doubt that Mostar owes to the older one An ancient date from the time of the Roman [illegible] [illegible] to 1440 by Radivoi Gost, prevot of the palace to [illegible] Gate of St Sava Immediately on their occupation [illegible] [illegible] by the Turks as their principal station and [illegible] to become the capital of the independent government and [illegible]

[illegible] Wa[illegible] [illegible] Cow and plough per week [illegible] Sarajevo [illegible]

L, an important town in Mesopotamia, on the [illegible] k of the Tigris, in 36° 35′ N lat and 43° 8′ E long [illegible] as in Baghdad, only part of the space within [illegible] covered with buildings and the rest [illegible] occupied [illegible] ines, even the solid lime-stone wall of the ancient [illegible] built in ruins, being serviceable only in the dire[illegible] [illegible] the river, where the wished inundation [illegible] Of the [illegible] at present in use, five are on the south, two on [illegible] two on the north, and the great bridge of boats on the [illegible] ving Mosul by the last named, the traveller first [illegible] stone bridges, 157 feet long then a level of [illegible] [illegible], which is overflowed only in spring and summer [illegible] [illegible] next a stretch of the river which, at such [illegible] not fordable, is passed by a bridge of boats [illegible] proper covering only one sixth of the full width [illegible] ers During the season of low water excellent [illegible] particularly water melons, are grown upon the [illegible] [illegible] portion of the river bed
